Energy Research Abstracts

Abstracts 9200-11973

Office of Scientific and Technical Information
UNITED STATES DEPARTMENT OF ENERGY

The Office of Scientific and Technical Information

The Office of Scientific and Technical Information (OSTI) in Oak Ridge, Tennessee, provides direction for the Department of Energy's scientific and technical information (STI) program and maintains a centralized base of support to assist Departmental elements in planning, developing, and implementing STI activities. DOE-originated and worldwide literature and software on advances in subjects of interest to DOE researchers are collected, processed, and disseminated using computerized databases, publications, and other media.

This information collection, containing over three million citations, represents a major national resource of scientific and technical information. In addition to information from DOE and its contractors, DOE acquires information through its international partnerships with the International Energy Agency's Energy Technology Data Exchange (ETDE), a consortium comprised of members from North America and Europe, Japan and Korea; the International Atomic Energy Agency's International Nuclear Information System, representing 80 countries; bilateral agreements with foreign governments; exchange agreements with other U.S. government agencies; and contracts with private information organizations and professional societies.

The subject scope of this information extends beyond energy, covering basic scientific studies in such areas as radiology, atomic and nuclear physics, radiation and nuclear chemistry, superconductivity, supercomputers, the environment, health and safety, waste management, nuclear medicine, and arms control.

Major DOE databases are available within the United States through DIALOG Information Services and STN International and outside the United States through formal governmental exchange agreements. DOE and DOE contractor offices can access the databases online through the Integrated Technical Information System (ITIS) maintained by OSTI.

Energy Research Abstracts

Coverage

Energy Research Abstracts (ERA) provides abstracting and indexing coverage of all scientific and technical reports and patent applications originated by the U.S. Department of Energy, its laboratories, energy centers, and contractors, as well as theses and conference papers and proceedings issued by these organizations in report form. Audiovisual materials, computer media (magnetic tapes, diskettes, etc.), and engineering drawings are included in this definition. *ERA* also covers other energy information prepared *in report form* by federal and state government organizations, foreign governments, and domestic and foreign universities and research organizations, *provided* that the full text of the document has been received by OSTI. Foreign report information is obtained through the International Energy Agency's 18-nation Energy Technology Data Exchange, the International Atomic Energy Agency's International Nuclear Information System, or nation-to-nation agreements. The purpose of this publication is to announce documents produced or obtained by DOE that are not so readily available as journal articles, books, or patents.

Scope

The scope of *ERA* encompasses DOE's research, development, demonstration, and technology programs resulting from its broad charter for energy sources, supplies, safety, environmental impacts, and regulation.

The citations presented in *ERA* are available for online searching as records within the Energy Science and Technology Database (EDB). The current-year records are available on the Integrated Technical Information System (ITIS).

Availability

DOE and DOE contractors can obtain *ERA* (regular issues and annual indexes) by using VISA, MasterCard, or OSTI deposit accounts. Contact the Office of Scientific and Technical Information, P.O. Box 62, Oak Ridge, TN 37831, Attention: Information Services. For further information, call (615)576-8401. *ERA* is also available at authorized GPO Depository Libraries. (List is provided on the inside back cover.)

ERA (regular issues and annual indexes) is available to the public on a subscription basis from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Managing Editor, Leota S. Kane
Technical Editor, Barry C. Steele

Information Sources

The citations presented in *Energy Research Abstracts* are a subset of the worldwide energy information provided to the Office of Scientific and Technical Information (OSTI) through exchange agreements with foreign sources and through exchanges or contracts with U.S. organizations.

The **Energy Technology Data Exchange (ETDE)** was established by the International Energy Agency to promote cooperation among members in conducting appropriate energy-related research and development programs through the development of a formal central information sharing system. In accomplishing the objectives of the ETDE, members select, abstract, and index relevant research information published in their countries in accordance with Exchange standards. OSTI serves as the central receiving and processing center for this information, which it then disseminates to national centers in the participating countries. The following countries are currently members of the ETDE:

- Australia
- Brazil
- Canada
- Denmark
- Finland
- France
- Germany
- Italy
- Japan
- Norway
- Poland
- Republic of Korea
- Spain
- Sweden
- Switzerland
- The Netherlands
- United Kingdom
- United States

The **International Nuclear Information System (INIS)** was established to promote the exchange of information on nuclear science and technology. Its operation is similar to that of the ETDE, with the INIS Secretariat being located in Vienna, Austria. Currently, 79 countries and 15 international organizations are members of INIS. OSTI serves as the INIS national center for the United States.

In the exercise of its rights and responsibilities under the agreements to which it is a party, the **Office of Scientific and Technical Information** both receives information from the above sources and submits U.S.-produced information to them. In addition to materials generated by the Department of Energy, this U.S.-produced information is gathered from other government agencies as well as under contract with private information processing companies. All input is computer processed and entered into a database for online retrieval. The database serves as well for the production of numerous OSTI publications.

How To Read A Citation

The principal data elements included in these citations are:

1. **Abstract number** within volume.
2. **Report number** identification for report-type literature.
3. **Title and subtitle** (non-English title may appear in parentheses, if applicable).
4. **Author(s).** First 10 names in the data record are printed, then "et al." is listed.
5. **Author affiliation.** Only first one is listed, in parentheses after author(s) to which it applies.
6. **Collaboration,** if present.
7. **Corporate author(s)** identifying corporation responsible for document.
8. **Date of publication.** If not known, a processing date is in brackets.
9. **Number of pages** or page range. Prices are based on total pages unless special pricing applies.
10. **Language** of document if non-English.
11. **Monograph title** if citation is an analytic (part, chapter, or paper) of a larger monograph.
12. **Sponsoring organization.**
13. **Contract or grant number.**
14. **Secondary identifying number;** may be a conference number.
15. **Conference title, location, and date,** if applicable.
16. **Order number.** The "DE" order number may be used for ordering from NTIS or OSTI, as appropriate. The "TI" prefix is valid only at OSTI.
17. **Sources of availability** from which a copy of the document may be obtained; usually appear as abbreviations. (See information on following page.)
18. **Drop note** or explanatory statement.
19. **Abstract.**
20. **Subject descriptors.** Listed only if no abstract or only a brief statement is included.

Canada Mortgage and Housing Corp., Ottawa, ON (Canada). 1990. (CONF-900724-Vol.1: Indoor Air '90: 5th international conference on indoor air quality and climate, Toronto (Canada), 29 Jul - 3 aug 1990). In Indoor air '90: The fifth international conference on indoor air quality and climate. Volume 1: Final report. 786p. Order Number DE90017786. Source: NTIS.

Air pollution in houses caused by combustion of coal is more serious than that by combustion of natural gas and methane (primarily by SO_2 and NO_2). The gas concentration after cooking is higher than that before cooking, and it is higher in kitchen than in bedroom and outdoor. There were mutations in the extract from TSP in $30m^2$ air in the bedroom, kitchen and outdoor, where coal and natural gas were used. The supernatant saliva activity of children whose family uses coal is significantly lower than that of pumping streams.

How To Order from the Availability Sources

TO OBTAIN A REPORT

Report literature, usually identified by an alphanumeric identifier at the beginning of a citation, is available from the sources listed in the citation (see example of element 2 on page iii). Often the sources are listed as abbreviations. Corresponding addresses are provided at right from which documents with these abbreviations may be ordered. When "OSTI" is given, **DOE and DOE contractors may order these documents from OSTI.** (However, check with your library or information organization which may require that orders go through them to OSTI.) OSTI prices are based on total pages unless special pricing applies. The public should order from NTIS or from one of the other agencies listed in the citation. NTIS price codes may continue to appear in some records. To expedite processing, an order form is provided in the back of this publication. NOTE: The order numbers provide quicker access for report ordering. Use the order number where possible.

How To Use the Indexes

Five indexes are provided for approaching the content of each issue of *Energy Research Abstracts*. Descriptions of entries in these indexes follow.

Corporate Author Index
The corporation, organization, or institution responsible for the issuance of the document is listed in this index. The entries are arranged alphabetically and provide the title and citation number of the reference. For example, the listing for the "Report" sample citation would appear as shown at right.

Wisconsin Univ., Madison (USA). Dept. of Physics
[Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)
Wisconsin Univ., Madison (USA). Lab. of Genetics
Organization of the R chromosome region in maize: Final progress report, June 1, 1983–May 31, 1986, 15:18255 (R;US)

Personal Author Index
Each author's name listed on a document cited in this issue is indexed. An index entry provides title and citation number; for secondary and other names, a cross-reference is given to the primary author name where the full index entry is located.

Hadley, D.L., *See* Lee, A.D., 15:17651
Haeberli, W., [Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)

Subject Index
This index lists the main subject descriptors assigned to each record by indexing professionals. A secondary or qualifier term is used where necessary to describe materials, objects, and processes. Document titles may be enhanced with additional informative phrases where necessary. An excerpt from this index appears at right.

HYDROGEN ISOTOPES
See also DEUTERIUM
HYDROGEN 4
TRITIUM
Neutron-Rich Isotopes
Study on the strong neutron-rich nuclei of lightest elements, 15:18686 (RA;SU;In Russian)

Contract Number Index
DOE technical reports are listed by contract number. Each entry also provides the primary corporation or organization cited for that contract number. A typical entry is shown.

FG02-88ER40438 **Wisconsin Univ., Madison (USA). Dept. of Physics**
15:18494 DOE/ER/40438–T1
FG02-88ER60664 **Rogers and Associates Engineering Corp., Salt Lake City, UT (USA)**

Report Number Index
Technical report literature is indexed by the alphanumerical identifier of the report. Patent documents and conferences are included for convenience. Each entry lists the citation number, the source of availability of the document, an indicator of presence at a GPO depository library, order number, and distribution category. A typical entry is:

DOE/ER/40438–T1	15:18494	NTIS, OSTI	E 1.99: DE89007246	MF-411

Subject Contents

The subject content of *Energy Research Abstracts* is arranged as shown below. The two-digit and four-digit category numbers printed here illustrate the category number assignment used in the database records.* The following list includes all of the 38 first-level and the 313 second-level categories. Because each issue of *ERA* publishes citations only for those documents announced during the past semimonthly period, some subject categories may not be present in every issue.

Numerical Listing of Categories

01 COAL LIGNITE, AND PEAT
- 03 Preparation
- 04 Processing

Energy Research Abstracts

01 COAL, LIGNITE, AND PEAT

0103 Preparation

Refer also to citation(s) 9260

9200 (DOE/PC/88881–T23) **Engineering development of advanced physical fine coal cleaning technologies - froth flotation. Quarterly technical progress report No. 22, January 1, 1994–March 31, 1994.** Kaiser Engineers, Inc., Pittsburgh, PA (United States). [1995]. 140p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-88PC88881. Order Number DE95006661. Source: OSTI; NTIS; GPO Dep.

A study conducted by Pittsburgh Energy Technology Center of sulfur emissions from about 1,300 United States coal-fired utility boilers indicated that half of the emissions were the result of burning coals having greater than 1.2 pounds of SO_2 per million BTU. This was mainly attributed to the high pyritic sulfur content of the boiler fuel. A significant reduction in SO_2 emissions could be accomplished by removing the pyrite from the coals by advanced physical fine coal cleaning. An engineering development project was prepared to build upon the basic research effort conducted under a solicitation for research into Fine Coal Surface Control. The engineering development project is intended to use general plant design knowledge and conceptualize a plant to utilize advanced froth flotation technology to process coal and produce a product having maximum practical pyritic sulfur reduction consistent with maximum practical BTU recovery.

9201 (DOE/PC/90287–T17) **Oxidation of coal and coal pyrite mechanisms and influence on surface characteristics. Technical progress report.** Doyle, F.M. California Univ., Berkeley, CA (United States). Dept. of Materials Science and Mineral Engineering. 31 Aug 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90287. Order Number DE95007662. Source: OSTI; NTIS; GPO Dep.

The objective of this research is to develop a mechanistic understanding of the oxidation of coal and coal pyrite, and to correlate the intrinsic physical and chemical properties of these minerals, along with changes resulting from oxidation, with those surface properties that influence the behavior in physical cleaning processes. The results will provide fundamental insight into oxidation, in term of the bulk and surface chemistry, the microstructure, and the semiconductor properties of the pyrite. During the sixteenth quarter flotation tests were performed under controlled pH and potential conditions on different raw and thermally oxidized coals to investigate the effect of pH and polarization on the flotation behavior, and the ability to separate pyrite from coal by selective flotation of either coal or pyrite. The paper reports on (a) sample characteristics; (b) effect of pH on flotation; and (c) effect of solution potential on flotation.

9202 (DOE/PC/92208–T8) **Engineering development of advanced physical fine coal cleaning for premium fuel applications. Quarterly technical progress report No. 8, July 1994–September 1994.** Moro, N.; Shields, G.L.; Smit, F.J.; Jha, M.C. AMAX Research and Development Center, Golden, CO (United States). 31 Oct 1994. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92208. Order Number DE95006662. Source: OSTI; NTIS; GPO Dep.

The primary goal of this project is the engineering development of two advanced physical fine coal cleaning processes, column flotation and selective agglomeration, for premium fuel applications. The project scope includes laboratory research and bench-scale testing on six coals to optimize these processes, followed by design, and construction of a 2 t/hr process development unit (PDU). The PDU will then be operated to generate 200 ton lots of each of three project coals, by each process. The project began in October, 1992 and is scheduled for completion by March, 1997. During Quarter 8 (July - September, 1994), work on the formulation of coal water slurries from flotation concentrates was completed. Parametric and optimization tests were performed on the Indiana VII coal using a 12-inch Microcel™ flotation column. Laboratory research on selective agglomeration was completed with limited testing of the Dietz coal and alternate agglomerants. Initial planning has started for the bench-scale agglomeration unit which will utilize heptane as the bridging liquid in a conventional two-stage system, and steam stripping for heptane recovery and recycle. A project review meeting was held at Bechtel to discuss the detailed design of the PDU, which is being designed to process Indiana VII, Sunnyside, and Taggart coals. Process flow, piping and instrument, and equipment layout diagrams are being revised to reflect the process improvements resulting from bench-scale testing. Material Requisition activity has commenced, and will continue next quarter along with the selection of a construction subcontractor.

9203 (DOE/PC/93209–T5) **Development of a gas-promoted oil agglomeration process. Technical progress report, October 1, 1994–December 31, 1994.** Wheelock, T.D.; Zhang, F. Iowa State Univ. of Science and Technology, Ames, IA (United States). [1994]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93209. Order Number DE95007656. Source: OSTI; NTIS; GPO Dep.

The overall purpose of this research project is to carry out the preliminary laboratory-scale development of a gas-promoted, oil agglomeration process for cleaning coal using model mixing systems. Research conducted during the preceding year showed the need for a semi-empirical mathematical model for representing and analyzing the kinetics of oil agglomeration of coal particles suspended in water. Such a model would provide the means for comparing and possibly correlating the effects of particle concentration and other parameters on the rate of agglomeration. Various models are being considered. One of the models is described below, and the results of fitting the model to experimental data are presented. These experiments were made not only to test the model, but also to compare the effects of particle concentration and the amount of air present on the rate of agglomeration.

9204 (DOE/PC/94217–T1) **A study of multi-stage/multi-function column for fine particle separation. Quarterly technical progress report, July 8, 1994–September 30, 1994.** Chiang, Shiao-Hung. Pittsburgh Univ., PA (United States). Dept. of Chemical and Petroleum Engineering. 20 Jan 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94PC94217. Order Number DE95007995. Source: OSTI; NTIS; GPO Dep.

The overall objective of the proposed research program is to explore the potential application of a new invention involving a multi-stage column equipped with vortex-inducing loop-flow contactors (hereafter referred to as the multi-stage flotation column) for fine coal cleaning and other solid-solid separations. The research work will identify the design parameters and their effect on the performance of the separation process. The results of this research will provide a basis for further development of the technology. In the past three months, the efforts focused on project planning and design of test equipment. A description of technical progress is presented.

9205 (DOE/PC/94217–T2) **A study of multistage/multifunction column for fine particle separation. Quarterly technical progress report, October 1, 1994–December 31, 1994.** Chiang, Shiao-Hung. Pittsburgh Univ., PA (United States). Dept. of Chemical and Petroleum Engineering. 10 Feb 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94PC94217. Order Number DE95007996. Source: OSTI; NTIS; GPO Dep.

The overall objective of the proposed research program is to explore the potential application of a new a multistage column

equipped with vortex-inducing loop-flow contactors (hereafter referred to as the multistage flotation column) for flotation processes using gaseous-CO_2. The research work will identify the design parameters and their effect on the performance of the separation process. The results of this study will provide a basis for further development of this technology. In the last quarter, the authors completed Task 1 (Project Planning) and performed equipment design. In this quarter, the authors have started to construct the new column for hydrodynamic tests and expect to complete the installation work in the next quarter. The shake-down test is scheduled for March 1995.

9206 (DOE/MC/30012–3953) **Advanced sulfur control concepts for hot-gas desulfurization technology. Quarterly report, July–September 1994.** Harrison, D.P. Louisiana State Univ., Baton Rouge, LA (United States). Oct 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-94MC30012. Order Number DE95000044. Source: OSTI; NTIS; GPO Dep.

Primary effort during the past quarter was devoted to a thermodynamic analysis of the reduction/desulfurization and regeneration cycles of the high temperature coal gas desulfurization process. The regeneration cycle analysis concentrated upon the potential for the direct production of elemental sulfur and considered the three regeneration concepts previously identified partial oxidation in an O_2-starved environment, reaction with SO_2, and regeneration with steam. The latter concept produces H_2S instead of elemental sulfur, but is attractive because of existing technology to convert high concentrations of H_2S into sulfur. All thermodynamic analysis was based upon the principle of free energy minimization and used the computer program CHEMQ. Each candidate sorbent was evaluated over a temperature range of 600 to 1,150 K, and a pressure range of 1 to 25 atm for both the reduction/desulfurization and regeneration cycles. The thermodynamic analysis indicates that zinc oxide, in particular, has the potential for removing more than 99% of the H_2S from both the Texaco and KRW gases. Yet the possibility of forming sulfur, or even high concentrations of H_2S, during regeneration is quite small. Iron oxide, which is somewhat less effective for H_2S removal, is more amenable to elemental sulfur formation, particularly via the particle oxidation concept. The thermodynamic properties of both SnO_2 and CeO_2 are uniquely favorable for elemental sulfur production, but exhibit lower affinity for H_2S removal. A process involving either of the sorbents would require two-stage desulfurization to produce product gases having H_2S concentrations in the 20 ppmv range. Highlights and an overall summary are described in this quarterly report.

9207 (DOE/PC/89903–T19) **Molecular biological enhancement of coal desulfurization. Final report.** Krawiec, S. Lehigh Univ., Bethlehem, PA (United States). Dept. of Molecular Biology. [1994]. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89PC89903. Order Number DE95005492. Source: OSTI; NTIS; GPO Dep.

During the period from 1986 through 1993 the prospect of bacterial desulfurization of fossil fuel was transformed from a theoretically appealing concept to a demonstrable laboratory phenomenon. Results from several laboratories confirmed that there was not one but, rather, several metabolic bases of selectively removing sulfur from the carbon frame of sulfur-containing organic compounds characteristic of fossil fuels. Results in this report relate solely to the so-called "4S" pathway (named for the four sulfur-containing compounds in the sequence: (I) dibenzothiophene [DBT] → (2) dibenzothiophene sulfoxide [DBTO] → (3) dibenzosulfone [$DBTO^2$] → (4) dibenzosulfonate → monohydroxybiphenyl [OH-BP] + $SO_4^=$. [An additional desulfurized product, biphenyl, has been hypothesized and another, o,o′-biphenyl, observed.]) The following subjects are discussed: isolating bacteria with a $DbtS^+$ phenotype; confirming the production of a desulfurized product; determining the identity of the isolates; determining the growth characteristics of the isolates in batch and continuous cultures; determining the kinetics and yields of product in batch and continuous cultures.

9208 (DOE/PC/90057–T9) **The selective catalytic cracking of Fischer-Tropsch liquids to high value transportation fuels. Final report.** Schwartz, M.M.; Reagon, W.J.; Nicholas, J.J.; Hughes, R.D. Amoco Oil Co., Naperville, IL (United States). Research and Development Dept. [1994]. 144p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC90057. Order Number DE95001933. Source: OSTI; NTIS; GPO Dep.

Amoco Oil Company, investigated a selective catalytic cracking process (FCC) to convert the Fischer-Tropsch (F-T) gasoline and wax fractions to high value transportation fuels. The primary tasks of this contract were to (1) optimize the catalyst and process conditions of the FCC process for maximum conversion of F-T wax into reactive olefins for later production of C_4-C_8 ethers, and (2) use the olefin-containing light naphtha obtained from FCC processing of the F-T wax as feedstock for the synthesis of ethers. The catalytic cracking of F-T wax feedstocks gave high conversions with low activity catalysts and low process severities. HZSM-5 and beta zeolite catalysts gave higher yields of propylene, isobutylene, and isoamylenes but a lower gasoline yield than Y zeolite catalysts. Catalyst selection and process optimization will depend on product valuation. For a given catalyst and process condition, Sasol and LaPorte waxes gave similar conversions and product selectivities. The contaminant iron F-T catalyst fines in the LaPorte wax caused higher coke and hydrogen yields.

9209 (DOE/PC/90300–T10) **Rapid pressure swing absorption cleanup of post-shift reactor synthesis gas. Technical progress report, September 1990–August 1993.** Sirkar, K.K. (New Jersey Institute of Technology, Newark, NJ (United States). Dept. of Chemical Engineering); Majumdar, S.; Bhaumik, S. Stevens Inst. of Tech., Hoboken, NJ (United States). Dept. of Chemistry and Chemical Engineering. [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90300. Order Number DE95006668. Source: OSTI; NTIS; GPO Dep.

A model for the separation of CO_2 from a mixture of CO_2 and N_2 using aqueous solutions of diethanolamine (DEA) as a reactive absorbent has been developed for a particular type of RAPSAB cycle (mode 3). The numerical simulations of the model compare well with the experimental results. In addition, the separation of CO from N_2 was studied using a 0.4 M Cu_2Cl_2 in 2M KCl solution as an absorbent.

9210 (DOE/PC/90305–T13) **Probe molecule studies: Active species in alcohol synthesis. Final report, July 1993–July 1994.** Blackmond, D.G.; Wender, I.; Oukaci, R.; Wang, Jian. Pittsburgh Univ., PA (United States). Dept. of Chemical and Petroleum Engineering. Jul 1994. 158p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90305. Order Number DE95003514. Source: OSTI; NTIS; GPO Dep.

The objectives of this project are to investigate the role(s) of cobalt and copper in constructing the active sites for the formation of higher alcohols from CO/H_2 over the Co-Cu based catalysts by using different reduction treatments and applying selected characterization tools such as TPR, TPD, XRD and XPS as well as to generate mechanistic information on the reaction pathway(s) and key intermediate(s) of higher alcohol synthesis from CO/H_2 over Co-Cu/ZnO catalysts by the approach of in-situ addition of a probe molecule (nitromethane).

9211 (DOE/PC/91311–T13) **Configurational diffusion of asphaltenes in fresh and aged catalyst extrudates. Quarterly progress report, September 20, 1994–December 20, 1994.** Guin, J.A. Auburn Univ., AL (United States). Dept. of Chemical Engineering. [1994]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91311. Order Number DE95007654. Source: OSTI; NTIS; GPO Dep.

The objective of this research is to determine the relationship between the size and shape of coal and petroleum macromolecules and their diffusion rates i.e., effective diffusivities, in catalyst pore structures. That is, how do the effective intrapore diffusivities depend on molecule configuration and pore geometry. Three tasks are planned to meet this objective: Task 1–relationship between effective intrapore diffusion coefficients, molecular size and pore

geometry; Task 2–effects of solvent composition, solute concentration, and temperature on the molecular configuration and diffusion rate of coal and petroleum asphaltenes in catalyst pores; and Task 3–assessment of diffusional limitations in aged catalysts. This quarter, GPC (gel permeation chromatography) equipment was tested. In addition, asphaltenes were prepared by extracting a petroleum asphalt to obtain n-pentane insolubles. Two chemicals, THF and toluene, were chosen as solvents. Stock solutions of asphaltenes in solvents were prepared for the diffusion experiments. Some adsorptive uptake runs for asphaltenes on porous catalyst particles were performed. The results showed that uneven uptakes for asphaltene fractions with different molecular sizes occurred, with fractions of smaller molecules being more adsorbed. Knowledge of the transport properties of these materials into catalyst pores is necessary to allow rational design of catalysts and reaction operations associated with the upgrading of these asphaltenes.

9212 (DOE/PC/93216–T5) **Fluid dynamics of pressurized, entrained coal gasifiers. Technical progress report, fifth quarter, October 1, 1994–December 31, 1994.** Louge, M.Y. Cornell Univ., Ithaca, NY (United States). Sibley School of Mechanical and Aerospace Engineering. [1994]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93216. Order Number DE95007658. Source: OSTI; NTIS; GPO Dep.

Pressurized, entrained gasification is a promising new technology for the clean and efficient combustion of coal. Because of the extraordinary difficulties involved in performing measurements in hot, pressurized, high-velocity pilot plants, its fluid dynamics are largely unknown. Thus the designer cannot predict with certainty crucial phenomena like erosion, heat transfer and solid capture. In this context, the authors are conducting a study of the fluid dynamics of Pressurized Entrained Coal Gasifiers (PECGs). The idea is to simulate the flows in generic industrial PECGs using dimensional similitude. To this end, they employ a unique entrained gas-solid flow facility with the flexibility to recycle–rather than discard–gases other than air. By matching five dimensionless parameters, suspensions in mixtures of helium, carbon dioxide and sulfur hexafluoride simulate the effects of pressure and scale-up on the fluid dynamics of PECGS. Because it operates under cold, atmospheric conditions, the laboratory facility is ideal for detailed measurements. In the fifth quarter of this project, the authors completed experiments to compare the behavior of pressurized entrained gasifiers to that of conventional atmospheric circulating fluidized beds. These experiments fluidized plastic powders with a mixture of 40.4% SF_6 in a balance of CO_2. Under these conditions, they recorded axial profiles of the gas pressure to infer the vertical distribution of solids along the column, as well as radial profiles of solid volume fraction using an optical fiber probe. They then compared the profiles with those recorded earlier under simulated atmospheric conditions using mixtures of He and CO_2.

9213 (DOE/PC/93224–T5) **Large scale solubilization of coal and bioconversion to utilizable energy. Fifth quarterly technical progress report, October 1, 1994–December 31, 1994.** Mishra, N.C. South Carolina Univ., Columbia, SC (United States). Dept. of Biological Sciences. [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93224. Order Number DE95006940. Source: OSTI; NTIS; GPO Dep.

In order to develop a system for a large scale coal solubilization and its bioconversion to utilizable fuel, the authors plan to clone the genes encoding Neurospora protein that facilitate depolymerization of coal. The authors also plan to use desulfurizing bacteria to remove the sulfur in situ and use other microorganisms to convert biosolubilized coal into utilizable energy following an approach utilizing several microorganisms. In addition the product of coal solubilized by fungus will be characterized to determine their chemical nature and the mechanism of reaction catalyzed by fungal product during in vivo and in vitro solubilization by the fungus or purified fungal protein.

9214 (SAND–94-2917C) **Comparison of the activities of fine-particle size catalysts.** Stohl, F.V.; Diegert, K.V.; Goodnow, D.C. Sandia National Labs., Albuquerque, NM (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950402–1: 209. American Chemical Society national meeting, Anaheim, CA (United States), 2-7 Apr 1995). Order Number DE95004773. Source: OSTI; NTIS; GPO Dep.

The objectives of Sandia's fine-particle size catalyst testing project are to evaluate and compare the activities of the fine-particle size catalysts being developed in DOE/PETCs Advanced Research Coal Liquefaction Program by using standard coal liquefaction test procedures. The standard procedures use Blind Canyon coal, phenanthrene as the reaction solvent, and a factorial experimental design with temperatures from 350°C to 400°C, reaction times from 20 to 60 minutes, and catalyst loadings up to 1 wt%. Catalytic activity is measured in terms of tetrahydrofuran conversion, heptane conversion, the amount of 9,10-dihydrophenanthrene in the product, and the gas yield. Several catalysts have been evaluated including a commercially available pyrite, a sulfated iron oxide from the University of Pittsburgh, and several preparations of 6-line ferrihydrites from Pacific Northwest Laboratories. Results have demonstrated that significant differences in activity can be detected among these catalysts.

9215 (ANL/CHM/CP–82789) **Comparison of several contemporary ionization/mass analyzer techniques for large components of complex fossil-derived materials.** Hunt, J.E.; Winans, R.E. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-940813–36: 208. American Chemical Society national meeting, Washington, DC (United States), 21-26 Aug 1994). Order Number DE95005863. Source: OSTI; NTIS; GPO Dep.

Coals and coal-derived samples provide a unique mixture for development and comparison of mass spectrometric techniques for high molecular weight analyses. The Argonne Premium Coal samples (APCS) are convenient for assessing classical and novel mass spectrometric techniques. Vacuum pyrolysis mass spectrometry of APCS 4 (Pittsburgh No. 8) has been reported. Alkyl-substituted aromatic compounds and hydroxy- and dihydroxy-substituted aromatic compounds were observed. Newer techniques such as laser desorption (LD), as well as in-beam techniques, such as desorption chemical ionization (DCI) and desorption electron ionization (DEI) are better suited to the studies of mixture characterization as presented by fossil fuels.

9216 (DOE/PC/91053–T8) **Fundamental studies of coal liquefaction.** SRI International, Menlo Park, CA (United States). [1995]. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91053. Order Number DE95005553. Source: OSTI; NTIS; GPO Dep.

The authors have examined the pyrolysis of Argonne samples of Wyodak and Illinois No. 6 coal in argon, undecane, Tetralin, and water. The effects of the pyrolysis on individual particles of coal were monitored visually in a cell with diamond windows capable of operation to temperature and pressures in excess of 500°C and 3000 psi. The changes in the particles from ambient to 460°C were recorded in real time on video tape, and images were then taken from the tape record and analyzed. The study showed that in argon both coals developed tars at 350°-370°C. The tars then quickly evaporated, leaving core particles remarkably similar in size and shape to the initial particles. These observations suggest that coal does not melt nor become fully liquid when heated. Nor does the softened coal undergo crosslinking to generate coke. Rather the simple loss of volatiles leaves behind the core residue as coke. Contrary to the common view, there appears to be no link between the bond-breaking processes yielding tar and the interaction of the coal with H-donors leading to liquefaction. Water as a medium was surprising in its effect. Both coals began to shrink at 300°-350°C, with the effect appearing to be more of an erosion rather than a uniform loss of substance as seen in Tetralin. The Wyodak continued to shrink to 460°C to about half its initial size. With the Illinois No. 6 coal, however, the process reversed at around 420°C, and the particles appeared to grow with the evolution of a tar, continuing to 460°C. The authors submit that this final observation is evidence for hydrothermal synthesis of hydrocarbons at these conditions.

9217 (DOE/PC/91285–12) **Two dimensional NMR and NMR relaxation studies of coal structure. Progress report, June 30, 1994–September 30, 1994.** Zilm, K.W.; Wu, X. Yale Univ., New Haven, CT (United States). Dept. of Chemistry. [1994]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91285. Order Number DE95007665. Source: OSTI; NTIS; GPO Dep.

This report covers the progress made on the title project for the project period. Four major areas of inquiry are being pursued. Advanced solid state NMR methods are being developed to assay the distribution of the various important functional groups that determine the reactivity of coals. Special attention is being paid to methods that are compatible with the very high magic angle sample spinning rates needed for operation at the high magnetic field strengths available today. Polarization inversion methods utilizing the difference in heat capacities of small groups of spins are particularly promising. Methods combining proton-proton spin diffusion with ^{13}C CPMAS readout are being developed to determine the connectivity of functional groups in coals in a high sensitivity relay type of experiment. Additional work is aimed at delineating the role of methyl group rotation in the proton NMR relaxation behavior of coals. 32 refs.

9218 (DOE/PC/92544–9) **Vapor pressures and heats of vaporization of primary coal tars. Quarterly technical progress report, July 1, 1994–September 30, 1994.** Suuberg, E.M. Brown Univ., Providence, RI (United States). Div. of Engineering. [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92544. Order Number DE95005526. Source: OSTI; NTIS; GPO Dep.

The vapor pressure correlations that exist at present for coal tars are very crude and they are not considered reliable to even an order of magnitude when applied to tars. The present project seeks to address this important gap in the near term by direct measurement of vapor pressures of coal tar fractions.

9219 (ANL/ES/CP–83740) **Engineering analysis of CO_2 control and disposal in IGCC systems.** Livengood, C.D.; Doctor, R.D.; Molburg, J.C.; Thimmapuram, P. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941210–3: Power generation conference, Orlando, FL (United States), 7-9 Dec 1994). Order Number DE95005876. Source: OSTI; NTIS; GPO Dep.

The possibility of global climate change resulting from increasing levels of "greenhouse" gases is the subject of considerable debate and uncertainty. Because of these concerns, policies to limit carbon dioxide (CO_2) emissions are being discussed in the United States and in various international forums. The options under consideration include strong energy-conservation measures, the capture and sequestering of CO_2, and the substitution of nonfossil energy sources for fossil-fuel combustion. Discussion of these issues has drawn considerable interest to power-generating systems that minimize the production of CO_2 and are particularly amenable to CO_2 capture. This paper presents results from a study of the impacts associated with CO_2 recovery in IGCC systems, which was conducted for the Morgantown Energy Technology Center by Argonne National Laboratory. The objective of the study was to compare, on a consistent systems-oriented basis, the energy and economic impacts of adding CO_2 capture and sequestration to an IGCC system. The research reported here emphasized commercial technologies for capturing CO_2, but other work has also addressed advanced technologies under development and alternate power-system configurations that might enhance system efficiency.

9220 (ANL/ES/CP–83741) **Development of control technology for emissions of mercury in flue gases.** Livengood, C.D.; Huang, Hann S.; Mendelsohn, M.H.; Wu, Jiann, M. Argonne National Lab., IL (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941210–4: Power generation conference, Orlando, FL (United States), 7-9 Dec 1994). Order Number DE95005875. Source: OSTI; NTIS; GPO Dep.

Concerns regarding emissions of hazardous air pollutants (air toxics) have emerged as a major environmental issue. The authority of the U.S. Environmental Protection Agency to regulate such pollutants was greatly expanded through the Clean Air Act Amendments of 1990. Mercury emissions have been singled out for particular attention because of concerns over possibly significant effects on human health. Some of those emissions originate in the combustion of coal, which contains trace amounts of mercury. Conventional flue-gas cleanup (FGC) technologies are not very effective in controlling emissions of mercury, and enhancements or supplemental technologies need to be developed. This paper gives a brief overview of research being conducted at Argonne National Laboratory on the capture of mercury by both dry sorbents and wet scrubbers. The emphasis in the research is on development of a better understanding of the key factors that control the capture of mercury. Future work is expected to utilize that information for the development of new or modified process concepts featuring enhanced mercury capture capabilities.

9221 (ANL/ES/CP–83845) **Cryogenic separation of CO_2 from the fluegas of conventional coal-fired power plants.** Brockmeier, N.F.; Jody, B.J.; Wolsky, A.M.; Daniels, E.J. Argonne National Lab., IL (United States). [1995]. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9411135–4: ASPENWORLD 94, Boston, MA (United States), 6-9 Nov 1994). Order Number DE95005877. Source: OSTI; NTIS; GPO Dep.

The reduction of CO_2 emissions to the atmosphere is under study because such emissions are believed to contribute to undesired global warming via the greenhouse effect. Several conceptual processes for the capture of CO_2 from power-plant flue gas are listed, with an emphasis on refrigeration and compression as a promising process to compete with amine absorption. At conditions that are industrially achievable (temperature of 170 K and pressure of 5 bar), CO_2 forms a nearly pure solid on cooling from an impure mixed vapor. This study relies on this freezing and purification process to remove 90% or more of the CO_2 from flue gas. Thermal and mechanical integration are used in the conceptual flow sheet to achieve better efficiency. A computerized process simulator, Aspen Plus with Model Manager®, is used to rigorously calculate the material and energy balances for the conceptual process. Key parameters are regressed from the component physical properties of the flue gas and used by the computer in the Peng-Robinson equation of state to quantify the required phase changes of CO_2 solid between vapor and liquid states. Results of process evaluation are given over a range of operating conditions: pressures from 2 to 25 bar and temperatures from 150 to 220 K. This CO_2 separation is shown to be technically feasible by using relatively simple and compact heat-exchange and compression equipment, with an energy requirement of 0.54 kWh/kg CO_2, even without optimization. For comparison, the energy used by state-of-the-art amine absorption is 0.43 kWh/kg. In spite of the 25% higher energy requirement for a cryogenic separation plant, the expectation is that it should have a 4% lower cost per tonne of avoided CO_2 because it is estimated to require a much lower capital investment than amine absorption.

9222 (DOE/MC/29244–3955) **Disposal of fluidized-bed combustion ash in an underground mine to control acid mine drainage and subsidence. Quarterly report, May–August 1994.** West Virginia Univ. Research Corp., Morgantown, WV (United States). Oct 1994. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-94MC29244. Order Number DE95000046. Source: OSTI; NTIS; GPO Dep.

During Phase 1 the project is segregated into four areas of reporting: (A) Grout Formulation, (B) Grout Characterization, (C) Water Quality Monitoring, (D) Subsidence Control and Contaminant Transport. The first component involves formulating a grout mixture with appropriate phlebolith to be used in filling complex mine voids. The Grout Characterization component will determine the phlebolith characteristics of the formulated grout. The Water Quality component involves background monitoring of water quality and precipitation at the Phase 3 (Longridge) mine site. The last component involves evaluating the strength requirements and the

migration of contaminants through the candidate grouts. This report separately discusses progress on all components of the program in order of project subtask.

9223 (DOE/MC/30010–3985) **Bench-scale demonstration of hot-gas desulfurization technology. Quarterly technical progress report, July 1, 1994–September 30, 1994.** Research Triangle Inst., Durham, NC (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30010. Order Number DE95006649. Source: OSTI; NTIS; GPO Dep.

The U.S. Department of Energy (DOE), Morgantown Energy Technology Center (METC), is sponsoring research in advanced methods for controlling contaminants in hot coal gasifier gas (coal gas) streams of integrated gasification combined-cycle (IGCC) power systems. The programs focus on hot-gas particulate removal and desulfurization technologies that match or nearly match the temperatures and pressures of the gasifier, cleanup system, and power generator. The purpose is to eliminate the need for expensive heat recovery equipment, reduce efficiency losses due to quenching, and minimize wastewater treatment costs. Hot-gas desulfurization research has focused on regenerable mixed-metal oxide sorbents which can reduce the sulfur in coal gas to less than 20 ppmv and can be regenerated in a cyclic manner with air for multicycle operation. Zinc titanate (Zn_2TiO_4 or $ZnTiO_3$), formed by a solid-state reaction of zinc oxide (ZnO) and titanium dioxide (TiO_2), is currently one of the leading sorbents. Overall chemical reactions with Zn_2TiO_4 during the desulfurization (sulfidation)-regeneration cycle are shown below: Sulfidation: $Zn_2TiO_4 + 2H_2S \rightarrow 2ZnS + TiO_2 + 2H_2O$; Regeneration: $2ZnS + TiO_2 + 3O_2 \rightarrow Zn_2TiO_4 + 2SO_2$. The sulfidation/regeneration cycle can be carried out in fixed-bed, moving-bed, or fluidized-bed reactor configuration, and all three types of reactors are slated for demonstration in the DOE Clean Coal Technology program. The fluidized-bed reactor configuration is most attractive because of several potential advantages including faster kinetics and the ability to handle the highly exothermic regeneration to produce a regeneration offgas containing a constant concentration of SO_2. This work describes the RTI processes for sulfur removal based on zinc titanate absorbtion and direct sulfur recovery process (DSRP) technologies.

9224 (DOE/MT/93009–1) **Simultaneous SO_2/NO separation from flue gas using HFCLM. Final report.** Schimmel, K. North Carolina Agricultural and Technical State Univ., Greensboro, NC (United States). Dept. of Chemical Engineering. [1995]. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93MT93009. Order Number DE95007060. Source: OSTI; NTIS; GPO Dep.

Abatement technologies for oxides of sulfur and nitrogen present in flue and stack gases from coal fired boilers are becoming increasingly important. Scrubbing the gases with an aqueous limestone slurry to remove SO_2 is a widely used treatment process. These scrubbing solutions are, however, not very effective in removing NO. In addition, the process is expensive and produces large volumes of sludge. The liquid membrane from a 0.01 M aqueous solution of Fe^{2+}EDTA has been found to have a very high selectivity for NO over N_2. Thus, SO_2/NO_x can be removed simultaneously using an aqueous Fe 3^{3+}EDTA solution in a hollow fiber contained liquid membrane (HFCLM) permeator with hydrophobic fibers. The HFCLM configuration has addressed previous concerns about liquid membrane stability for an application such as this. In this project, a flow apparatus was constructed that will allow simultaneous SO_2/NO removal and recovery using two hollow fiber modules in series. Flowing the liquid membrane on the shell-side of the modules it is hypothesized will enhance the performance over that of HFCLMs without loss of stability. From the work completed in this exploratory project, it was concluded that to move the current state-of-the-art for this promising technology toward commercialization will require progress in the following areas: (1) sensitivity of the performance of the system to temperature changes, (2) validation of a mass transfer model to be used in scale-up calculations, (3) data on alternative flow schemes, and (4) overall process economics calculations.

9225 (DOE/PC/81011–T39) **Tung FGD Test Facility. Monthly report (Phase II) (No. 52).** Raycon Research and Development, Inc., Brookline, MA (United States). 25 Nov 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC81011. Order Number DE95006666. Source: OSTI; NTIS; GPO Dep.

This document concisely summarizes the conclusions of this project. A series of recommendations for future work on the flue gas cleaning system are presented.

9226 (DOE/PC/92535–T8) **Control of coal combustion SO_2 and NO_x emissions by in-boiler injection of CMA. Seventh quarterly project status report, April 1, 1994–June 30, 1994.** Levendis, Y.A.; Wise, D.L. Northeastern Univ., Boston, MA (United States). [1995]. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92535. Order Number DE95006664. Source: OSTI; NTIS; GPO Dep.

The principal objectives of this research are two-fold: (A) To understand the mechanism and assess the effectiveness of sulfur capture by the chemical calcium magnesium acetate (CMA); and (B) To evaluate the NO_x reduction capabilities of CMA by pyrolyzing the organic constituents of the chemical (the acetate) and reducing NO to stable N_2. The optimum conditions and the location of CMA introduction in the furnace will be identified. To achieve these goals water solutions of CMA or dry powders of CMA were injected into hot air or gases simulating the furnace exhaust (containing SO_x, NO_x, H_2O, O_2 etc.) and the composition of gaseous and solid products of the reaction was monitored. The processes of burning the organic acetate as well as the calcination, sintering and sulfation of the remaining solid are studied. The effectiveness of "homemade" CMAs containing various amounts of calcium and magnesium was investigated to explore the role of the two chemicals in the NO_x and mainly the SO_2 capture processes. Finally, CMA was introduced in the matrix of coal particles by an ion exchange technique. Upon subsequent combustion, the SO_2-NO_x emissions were monitored and compared to those from burning untreated coal. The composition and physical structure of the ash residues was examined. Both techniques (CMA pretreatment and CMA injection) may commercially be implemented separate or simultaneously. The work reported herein pertains to introducing dry or wet CMA in the post-flame region of the furnace and monitoring the SO_2 and NO_x emissions.

9227 (DOE/PC/93256–T9) **Environmental Control Technology Center - report to the Steering Committee, final technical report.** Electric Power Research Inst., Palo Alto, CA (United States). Nov 1994. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94PC93256. Order Number DE95007919. Source: OSTI; NTIS; GPO Dep.

Operations and maintenance continued this month at the Electric Power Research Institute's Environmental Control Technology Center. Testing on the 4.0 MW Pilot Wet FGD unit continued with the Pilot Trace Element test block. On the Cold-Side Selective Catalytic Reduction (SCR) unit, testing continued as ammonia slip measurements were conducted at baseline and low temperature conditions. Additional tests were also performed on each side of the reactor as the individual catalysts were isolated and tested.

9228 (DOE/PC/94111–T2) **Particulate emission abatement for Krakow boiler houses. Technical progress report No. 2, July 1, 1994–September 30, 1994.** Gyorke, D.F. LSR Technologies, Inc., Acton, MA (United States). 8 Dec 1994. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94PC94111. Order Number DE95006942. Source: OSTI; NTIS; GPO Dep.

This project involves the implementation of Core Separator technology for particulate control in Krakow boiler houses. The current work includes: (1) finding a manufacturing partner, (2) obtaining a cost-share commitment, (3) preparing a business plan, and (4) finding host sites for demonstration plants in Krakow.

9229 (ANL–94/27) **Color measurements on marble and limestone briquettes exposed to outdoor environment in the Eastern United States. Volume I: Results of exposure 1984-1990.** Reimann, K.J. Argonne National Lab., IL (United States). Apr 1994. 65p. Sponsored by Department of the Interior, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95007632. Source: OSTI; NTIS; GPO Dep.

In a long-term program that began in 1984, limestone and marble briquettes have been exposed to both anthropogenic acid deposition and natural weathering at four field sites in the eastern United States. Similar tests began at an Ohio site in 1986. Effects of exposure on the briquettes and other materials at the sites are evaluated periodically by several federal agencies cooperating in the National Acid Precipitation Assessment Program (NAPAP). One of the primary contributions of Argonne National Laboratory to the NAPAP has been the measurement of tristimulus color change on samples exposed to the environment. Results from the first six years indicate a yellowing of the marble and a darkening of limestone on both the skyward and groundward surfaces of fresh and preexposed briquettes. The relationship between discoloration and exposure period appears to be linear. Discoloration rates as a function of a cumulative exposure time are almost constant for marble and slightly decreasing for limestone Dark spots on groundward surfaces were measured with tristimulus color equipment prior to chemical analysis to determine if a correlation exists between darkening (change in reflectance) and SO_4 concentration. Taking exposure time into consideration, and assuming that the airborne concentration of dark particles, which cause darkening, is proportional to airborne SO_2 concentration, one can establish a linear relationship between exposure time, darkening, and SO_2 concentration. The program is continuing so that additional data can be obtained.

9230 (INIS-mf–14458) **The environment state monitoring around big fossil-fuel power plants exemplified by Belchatow Power Plant. Symposium. Belchatow 29-30 April 1993.** Energoprojekt-Warszawa, Warsaw (Poland). [1993]. [166p.] (In Polish). (CONF-9304282–: The environment state monitoring around big fossil-fuel power plants exemplified by Belchatow Power Plant, Belchatow (Poland), 29-30 Apr 1993). Order Number DE95618342. Source: OSTI; NTIS; INIS.

The influence of big fossil fuel power plants on environment has been presented. The great variety of that topic aspects has been discussed in respect of Polish conditions taking the Belchatow Power Plants as a representative example. The state of air and soil pollution around Belchatow have been assessed on the ground of hitherto measurements, investigations and monitoring results. The ecological aspects in respect to forest area has been also investigated. The actually existing monitoring wet and other control systems including radiometric measurements has been presented as well as new concepts of their development in the future. Legal aspects and Polish regulations in the interested questions have been also described in detail.

(Energopomiar, Gliwice (Poland)); Adamek, E. Energoprojekt-Warszawa, Warsaw (Poland). [1993]. [166p.] (In Polish). (CONF-9304282–: The environment state monitoring around big fossil-fuel power plants exemplified by Belchatow Power Plant, Belchatow (Poland), 29-30 Apr 1993). In *The environment state monitoring around big fossil-fuel power plants exemplified by Belchatow Power Plant. Symposium. Belchatow 29-30 April 1993.* Order Number DE95618342. Source: OSTI; NTIS; INIS.

The influence of the big fossil-fuel power plants on air pollution has been shown exemplified by three Polish power plants: Turow, Kozienice and Belchatow. The monitoring system of SO_2, NO_x and flying ash applied in the ambient area of each of them has been presented. Changes in air quality during a several years period as well as in the environment degradation have been described and discussed. Technical measures to improve the situation and to diminish environment hazard being planned to apply in these three power plants also been discussed. 3 refs.

9232 (INIS-mf–14458, [pp. 30]) **The influence of Belchatow power plant on environment on the base of hitherto measurements and research.** Szarfenberg, H. (Elektrownia Belchatow, Belchatow (Poland)); Orzeszek, W. Energoprojekt-Warszawa, Warsaw (Poland). [1993]. [166p.] (In Polish). (CONF-9304282–: The environment state monitoring around big fossil-fuel power plants exemplified by Belchatow Power Plant, Belchatow (Poland), 29-30 Apr 1993). In *The environment state monitoring around big fossil-fuel power plants exemplified by Belchatow Power Plant. Symposium. Belchatow 29-30 April 1993.* Order Number DE95618342. Source: OSTI; NTIS; INIS.

Several aspects of the influence of Belchatow power plant on environment has been state of the environment has been shown. The assessment of the state of the environment has been made on the base of monitoring, different field measurements and other investigations collected during the period of 1966-1993. One paid the attention especially on: air pollution by SO_2, NO_x and flying ash; the development of emissions in the period of 1983-1993; radiation hazard and air pollution by the emission of radioisotopes existing in fuel (brown coal); the influence of ash and slag repository in environment. The technical measures planned to apply in the Belchatow power plant leading to diminish its negative influence on environment have been presented as well. 7 refs, 6 figs, 6 tabs.

Source: OSTI; NTIS; INIS.

The continuous control of the atmosphere pollution in the ambient area of big fossil fuel power plant has been shown as exemplified by Belchatow power plant, Poland. The monitoring net working around this plant consists in 9 stationary stations measuring SO_2 concentration in air (continuous measurements), dust fallout and sulfate content in it (monthly) as well as atmospheric precipitation with pH measurement (monthly). The actual system seems to be insufficient. A new concept of the monitoring has been presented. 5 refs.

9234 (INIS-mf–14458, [pp. 5]) **The assessment of the existing measuring system for atmospheric precipitation control around Belchatow power plant and a concept of its changing.** Hryniewicz, R. Energoprojekt-Warszawa, Warsaw (Poland). [1993]. [166p.] (In Polish). In *The environment state monitoring around big fossil-fuel power plants exemplified by Belchatow Power Plant. Symposium. Belchatow 29-30 April 1993.* Order Number DE95618342. Source: OSTI; NTIS; INIS.

The influence of fossil-fuel power plants on environment is also demonstrated by pollution of atmospheric precipitation with combustion products emitted to the atmosphere. Actual methods for the precipitation pollution control have been critically reviewed and their use fullness discussed. A new concept has been proposed for that purpose. The detailed analysis of chemical nature of effluents present in rain waters and their physical parameters will be used for environment state assessment in the future.

Source: OSTI; NTIS; INIS.

The mathematical modelling is a very convenient tool for description effluent transport into atmosphere. The new generation Gaussian trail model has been utilized in many countries. Also in Poland the model of that class based on modified solutions has been worked out and their applicability has been discussed. 18 refs.

9238 (INIS-mf–15088) **Environmental policy in brown coal mining in accordance with the precautionary measures principle and polluter pays principle.** Wirtschaftswissenschaftliche Diskussionsbeitraege, v. V-106-93. Hamann, R.; Wacker, H. Oldenburg Univ. (Germany). Inst. fuer Volkswirtschaftslehre (VWL). Feb 1993. 18p. (In German). Order Number DE95746686. Source: OSTI; NTIS (US Sales Only); INIS.

The precautionary measures principle and the polluter pays principle in brown coal mining are discussed. Ground water subsidence and landscape destruction are local or regional problems and thus easily detectable. If damage cannot be avoided, its authors are known and will pay. In spite of all this, the German brown coal industry is well able to compete on the world market with others who don't care about the environmental damage they may cause. ((orig./HS))

9239 (SA-PUB–1/94, pp. 273-276) **CO_2 fluxes in peatlands under varying temperature and moisture conditions.** Silvola, J. (Joensuu Univ. (Finland). Dept. of Biology); Alm, J.; Ahlholm, U.; Nykaenen, H.; Martikainen, P.J. Academy of Finland, Helsinki (Finland). 1994. In *The Finnish research programme on climate change. Second progress report.* 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

In spite of the large carbon store in mire ecosystems, the annual unbalance between the binding and release of carbon is quite small. In most mires, over 90 % of the carbon fixed in photosynthesis is released annually in soil respiration. The predicted atmospheric and climate change would alter the factors regulating production and decomposition. In many scenarios the summertime soil moisture has been thought to decrease in large areas of the boreal region. This would lead to the increasing variation of the water table in peatlands and to increase of the aerobic decomposition during the dry period. The climatic warming would still enhance this effect. One possibility in examining the long-term effects of the reducing soil moisture is to compare virgin and drained mires. Here the CO_2 fluxes, temperature and water level of peat was measured both in virgin mires and mires drained 20-50 years ago. The measurements were made in varying weather conditions resulting in CO_2 flux data from a wide range of water tables. The data thus represent both the CO_2 fluxes in the present conditions, and the estimates for the predicted future moisture regime.

9240 (SA-PUB–1/94, pp. 279-284) **Emissions of methane and nitrogen oxides from peatland ecosystems.** Martikainen, P.J. (National Public Health Inst., Kuopio (Finland). Dept. of Environmental Microbiology); Nykaenen, H.; Laang, K.; Alm, J.; Silvola, J. Academy of Finland, Helsinki (Finland). 1994. In *The Finnish research programme on climate change. Second progress report.* 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

Climatic change may cause drier, warmer summer in the high latitudes and cause remarkable changes in gas fluxes on peatlands. Drained peatlands can be used as models to predict the long-term effects of increased peat aeration on trace gas fluxes. Results are presented from studies about emissions of CH_4, N_2O and NO in both virgin and drained Finnish peatlands, and give some information about the factors regulating the production and consumption of these trace gases.

9241 (SA-PUB–1/94, pp. 291-296) **Response of leaching from mire ecosystems to changing climate.** Sallantaus, T. (Tampere Water and Environment District, Tampere (Finland)). Academy of Finland, Helsinki (Finland). 1994. In *The Finnish research programme on climate change. Second progress report.* 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

The main objectives of this subproject of SUOSILMU are to determine the role of leaching and retention in the long-term mass balance of mires, the primary regulators in the leaching process and the manner in which climatic change affects the rates of leaching from peatlands. This report focuses on the leaching rates of organic carbon, nitrogen and sulphur from the research sites of Lakkasuo, one of the main research objects of SUOSILMU.

9242 (SA-PUB–1/94, pp. 315-320) **Differences in carbon accumulation of two cut-over peatlands in Finland.** Roderfeld, H. (Helsinki Univ. (Finland). Dept. of Forest Ecology); Vasander, H.; Tolonen, K. Academy of Finland, Helsinki (Finland). 1994. In *The Finnish research programme on climate change. Second progress report.* 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

This study focused on the ecology of abandoned peatlands in Finland. The aim is to produce information about conditions favourable for recolonisation and regeneration of mires. This could serve as a basis for the management of milled peat cut-over sites which are designed for rewetting.

In order to study the feasibility of the dual-duct ventilation concept in an underground coal mine, it is helpful to have a brief understanding of the evolution of mine ventilation during the past century. The mechanization of mines and the infusion of technology have greatly impacted many aspects of mining including ventilation. Before mines were mechanized, ventilation served only

to provide air for the breathing and comfort of the workers (and animals) and to purge the open underground spaces of 'black damp', the products of slow combustion of coal, and of the explosive gases from blasting. In those days state mining regulations - before the enactment of federal regulations - typically required 50 to 200 cubic feet of ventilating air per worker.

9244 (ETDE-DE–29) **Information on the situation of the German coal mining industry. January - September 1994.** Statistik der Kohlenwirtschaft e.V., Essen (Germany). 21 Nov 1994. 16p. (In German). Order Number DE95753795. Source: OSTI; NTIS (US Sales Only).

The report provides up-to-date information on the German coal mining industry for the reporting time period. Data on coal mining as well as on brown coal mining cover: production, stocks, productivity, employees, sales, imports and exports of coal and coal products. (orig.)

9245 (ETDE-DE–32) **Automation in mining - sensor system for electric drives. Underground testing. Final report.** Dahlhaus, N. Ruhrkohle Bergbau AG, Herne (Germany). Nov 1994. 94p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0328903F. Order Number DE95756017. Source: OSTI; NTIS (US Sales Only).

Asynchronous motors run in mining are exposed to extremly rough operation conditions. High swithover frequency, strong load variations, and stalling result in extrem thermal stresses to the motors. This frequently results in excessive temperatures, accelerated ageing of windings, and cage bar solderings melting off. By identification of the temperatures of the hot spots and by consideration of additional electric an thermal operation parameters, a motor protection and diagnostic system was designed wich - monitors an protects electric drives; - gives information on the motor's thermals situation; - increases the overall availability of the equipment and thus; - increases the cost-effectiveness of underground installations. The system was prototype-tested on the rig. These tests were successfull. The functional reliability of the data gathering, transmission, and evaluation could be proven. The values determined by the motor model were congruent with the measured ones. (orig.)

0130 Transport, Handling, and Storage

9246 (DOE/PC/94117–T2) **Micronized coal-fired retrofit system for SO_x reduction: Krakow clean fossil fuels and energy efficiency program. Technical progress report number 2.** TCS, Inc., Oakland, MD (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States);Agency for International Development, Washington, DC (United States). DOE Contract FC22-94PC94117. Order Number DE95007659. Source: OSTI; NTIS; GPO Dep.

The objective of the project is to retrofit the Balice Boilerhouse with a TCS Coal Micronization System and Amerex baghouses to achieve higher combustion efficiencies and lower air emissions, including S02, NOX, CO and particulate matter. The Balice Boilerhouse is located adjacent to the Krakow Airport and provides heating steam for the Polish Military Unit No. 1616, which is based in the vicinity of the Krakow airport. Sulfur dioxide (SO_2) reduction during combustion with micronized coal is possible by co-micronizing limestone with coal. Nitrogen oxide reductions utilizing a TCS system result primarily from: the reduced combustion temperature of a micronized coal flame, lower excess air than other conventional coal combustion systems, and staged combustion achieved with the proprietary TCS Low-NO_x burner. Carbon monoxide reductions result because of the extremely high degree of carbon burnout achieved with micronized coal. The original project scope of work envisioned that TCS coal micronization systems would be retrofitted to four existing boilers at the Balice Boilerhouse. However, shortly after the project's start-up in March 1994, the Polish Military announced that it desired and intended to decommission its existing four boilers (due to old age and poor general condition) and replace them with two new units. As such, the project's scope of equipment supply and assessment expanded from use of the existing boilers, to requirements for implementing new units. This report describes the progress made to date on the various tasks.

The goal of this research in the area of mineral matter transport is to advance the capability of making reliable engineering predictions of the dynamics of net deposit growth for surfaces exposed to the products of coal combustion. To accomplish this for a wide variety of combustor types, coal types, and operating conditions, this capability must be based on a quantitative understanding of each of the important mechanisms of mineral matter transport, as well as the nature of the interactions between these substances and the prevailing "fireside" surface of deposits. This level of understanding and predictive capability could soon be translated into very significant cost reductions for coal-fired equipment design, development and operation. It is also expected that this research program will not only directly benefit the ash deposition R&D community — it would also help advance generically closely related technologies of importance to DOE (eg. hot-gas clean-up, particulate solids handling.....) In September 1990 DOE-PETC initiated at the Yale HTCRE Laboratory a systematic three-year research program directed toward providing engineers with the fundamentally-based design/optimization 'tools' for economically predicting the dynamics of net deposit growth, and thermophysical properties of the resulting microparticulate deposits in coal-fired systems.

9248 (DOE/PC/90099–T5) **Research on fundamental aspects of inorganic vapor and particle deposition in coal-fired systems. Quarterly technical report, December 6, 1990–March 5, 1991.** Rosner, D.E. The goal of this research in the area of mineral matter transport is to advance the capability of making reliable engineering predictions of the dynamics of net deposit growth for surfaces exposed to the products of coal combustion. To accomplish this for a wide variety of combustor types, coal types, and operating conditions, this capability must be based on a quantitative understanding of each of the important mechanisms of mineral matter transport, as well as the nature of the interactions between these substances and the prevailing "fireside" surface of deposits. This level of understanding and predictive capability could soon be translated into very significant cost reductions for coal-fired equipment design, development and operation. It is also expected that this research activity will not only directly benefit the ash deposition R&D community — but also generically closely related technologies of importance to DOE (eg. hot-gas clean-up, particulate solids handling ...) Order Number DE95006669. Source: OSTI; NTIS; GPO Dep.

Enhanced robustness of the signal-processing routine was obtained by development of the "dart test" technique, a "Monte Carlo" type idea. An initial guess of the position of the test particle is obtained by extrapolation of the two previous positions. The numerical procedure to calculate the position of the particle based on the antennae voltages is then implemented and the quality of the result is indicated by the smallness of the residual of the calculations. Then a random perturbation of the position of the initial guess is made to generate another guess. The calculations are conducted again on the basis of the new guess and the resulting residual is noted, More random perturbations of the initial guess are made followed by calculations of the particle position. The guesses created by the random perturbations are arrayed about the initial guess like darts on a target. The residuals are compared and that of smallest magnitude indicates the most accurate calculation of particle position. This procedure has been found to improve tracking accuracy and calculation robustness.

9259 (DOE/PC/91284–12) **Nitration of polynuclear aromatic hydrocarbons in coal combustors and exhaust streams. Quarterly report, July 1, 1994–September 30, 1994.** Yu, L.; Cho,

S.; Hildemann, L.; Niksa, S. Stanford Univ., CA (United States). Dept. of Civil Engineering. Dec 1994. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91284. Order Number DE95007667. Source: OSTI; NTIS; GPO Dep.

During the final period of July 1, 1994 through September 30, 1994, the polynuclear aromatic hydrocarbons (PAH) preparation project at SRI International and the analysis of PAH at Stanford were completed. Activity during this quarter on the sample preparation side continued to be devoted to experiments on the oxidative pyrolysis of coal volatiles. Complete product and nitrogen species distributions were determined with a Pit. No. 8 hvA bituminous coal and a Lower Kittaning low volatile bituminous coal over a broad range of oxygen levels. With these coals as with the Dietz subbituminous coal discussed in the past quarter, the authors found that the levels of PAH in oxidative pyrolysis products are too low to recover for detailed chromatographic analysis, even at oxygen concentrations as low as 2%.

9260 (DOE/PC/92162–T4) **The development of coal-based technologies for Department of Defense facilities. Semiannual technical progress report, September 28, 1993–March 27, 1994.** Miller, B.G. (and others); Morrison, J.L.; Sharifi, R.; Shepard, J.F.; Scaroni, A.W.; Hogg, R.; Chander, S.; Cho, H.; Ityokumbul, M.T.; Klima, M.S. Pennsylvania State Univ., University Park, PA (United States). 30 Nov 1994. 379p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-92PC92162. Order Number DE95006945. Source: OSTI; NTIS; GPO Dep.

The U.S. Department of Defense (DOD), through an Interagency Agreement with the U.S. Department of Energy (DOE), has initiated a three-phase program with the Consortium for Coal-Water Slurry Fuel Technology, with the aim of decreasing DOD's reliance on imported oil by increasing its use of coal. The program is being conducted as a cooperative agreement between the Consortium and DOE and the first two phases of the program are underway. To achieve the objectives of the program, a team of researchers was assembled. Phase I activities are focused on developing clean, coal-based combustion technologies for the utilization of both micronized coal-water slurry fuels (MCWSFS) and dry, micronized coal (DMC) in fuel oil-designed industrial boilers. Phase II research and development activities will continue to focus on industrial boiler retrofit technologies by addressing emissions control and precombustion (i.e., slagging combustion and/or gasification) strategies for the utilization of high ash, high sulfur coals. Phase III activities will examine coal-based fuel combustion systems that cofire wastes. Each phase includes an engineering cost analysis and technology assessment. The activities and status of Phases I and II are described below. The objective in Phase I is to deliver fully engineered retrofit options for a fuel oil-designed watertube boiler located on a DOD installation to fire either MCWSF or DMC. This will be achieved through a program consisting of the following five tasks: (1) Coal Beneficiation and Preparation; (2) Combustion Performance Evaluation; (3) Engineering Design; (4) Engineering and Economic Analysis; and (5) Final Report/Submission of Design Package.

9261 (DOE/PC/92528–T1) **Char particle fragmentation and its effect on unburned carbon during pulverized coal combustion. Quarterly report, July 1, 1994–September 30, 1994.** Diaz, R.; Mitchell, R.E. Stanford Univ., CA (United States). Jan 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92528. Order Number DE95007991. Source: OSTI; NTIS; GPO Dep.

This document is the eighth quarterly status report of work on a project concerned with the fragmentation of char particles during pulverized coal combustion that is being conducted at the High Temperature Gasdynamics Laboratory at Stanford University, Stanford, California. The project is intended to satisfy, in part, PETC's research efforts to understand the chemical and physical processes that govern coal combustion. The work is pertinent to the char oxidation phase of coal combustion and focuses on how the fragmentation of coal char particles affects overall mass loss rates and how char fragmentation phenomena influence coal conversion efficiency. The knowledge and information obtained will allow the development of engineering models that can be used to predict accurately char particle temperatures and total mass loss rates during pulverized coal combustion. In particular, the work will provide insight into causes of unburned carbon in the ash of coal-fired utility boilers and furnaces.

9262 (DOE/PC/92539–9) **Volatiles combustion in fluidized beds. Technical progress report, September 4, 1994–December 3, 1994.** Pendergrass, R.A. II; Mansker, L.D.; Hesketh, R.P. Tulsa Univ., OK (United States). [1995]. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92539. Order Number DE95006946. Source: OSTI; NTIS; GPO Dep.

The goal of this project is to investigate the conditions in which volatiles will burn within both the dense and freeboard regions of fluidized beds. Experiments using a fluidized bed operated at incipient fluidization are being conducted to characterize the effect of particle surface area, initial fuel concentration, and particle type on the inhibition of volatiles within a fluidized bed. The work conducted during the period 4 September, 1994 through 3 December 1994 is reported in this technical progress report. The research consists of the development of a simple model and improvements in the experimental system.

9263 (DOE/PC/93210–3) **Radiation/turbulence interactions in pulverized-coal flames. Technical progress report, first year, September 15, 1993–September 15, 1994.** Menguec, M.P.; McDonough, J.M.; Manickavsagam, S.; Ghosal, S.; Wang, D.; Mukerji, S. Kentucky Univ., Lexington, KY (United States). Dept. of Mechanical Engineering. [1994]. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93210. Order Number DE95007559. Source: OSTI; NTIS; GPO Dep.

The goal in this study is to investigate the interaction of radiation and turbulence in coal-fired laboratory scale flames and attempt to determine the boundaries of the uncertainty domain between no interactions and radiation-turbulence interactions. The authors have three distinct objectives (1) to determine from experiments the effect of turbulent fluctuations on the devolatilization/pyrolysis of coal particles and soot yield, and to measure the change in the effective radiative properties of particulates due to turbulence interactions; (2) to perform local small-scale simulations to investigate the radiation-turbulence interactions in coal-fired flames starting from first principles; and (3) to develop a thorough and rigorous, but computationally practical, turbulence model for coal flames, starting from the experimental observations and small scale simulations. Progress to date is described. 71 refs.

9264 (DOE/PC/94210–T1) **Pressure fluctuations as a diagnostic tool for fluidized beds. Technical progress report, October 1, 1994–December 31, 1994.** Brown, R.C.; Brue, E. Iowa State Univ. of Science and Technology, Ames, IA (United States). 10 Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94PC94210. Order Number DE95006929. Source: OSTI; NTIS; GPO Dep.

A number of modifications to the existing circulating fluidized bed models and facilities were completed during this quarter. The two small-scale cold model CFBs used in this project were redesigned, and changes were made to the data acquisition system. Following these major modifications, a number of tests were performed to determine the characteristics of pressure fluctuations in the circulating fluidized bed models. The first series of experiments was performed to determine whether static pressure fluctuations result from local disturbances near the pressure taps or whether pressure fluctuations are manifestations of global phenomena occurring throughout the fluidized bed. By using a static pressure probe inserted down the center of the CFB, it was shown that the static pressure fluctuation structure in the center of the bed is the same as the fluctuation structure found at the wall. This occurs even though the center of the bed is very dilute (dilute core) while the region nearest the bed walls has a significantly higher solids density (dense annulus). This suggests that the phenomena that describes the structure of pressure fluctuations is a global rather than local phenomena. The remainder of the tests were designed to provide more information on the dominant frequency observed in CFB pressure fluctuations. The results from a series of tests show that the dominant frequency observed in CFB pressure fluctuations does not change significantly with changes in the bed height.

9265 (SAND–94-8761) **Application of advanced technologies to ash-related problems in boilers.** Baxter, L.L. (Sandia National Labs., Livermore, CA (United States)); Richards, G.; Harb, J. Sandia National Labs., Albuquerque, NM (United States). Jan 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9408200–1: EPRI conference on the effect of coal quality on boiler performance, Charleston, SC (United States), 17-19 Aug 1994). Order Number DE95006197. Source: OSTI; NTIS; GPO Dep.

Prediction of ash behavior in boilers has, for many years, been based on relatively simple relationships involving the composition of inorganic material in fuels. In recent years, advanced analyses for both fuels and deposits have seen increasing use in the solid fuel combustion community. The combination of the standard and advanced analyses, together with a knowledge of boiler design and operating conditions, allow better interpretation of ash behavior in boilers than has previously been possible. This paper discusses several case histories where advanced technologies have been applied to interpret ash behavior in boilers where standard techniques were insufficient. Included in the discussion are: (1) the behavior of blends of fuels; (2) explanations for markedly different behavior between fuels with similar ASTM characteristics; and (3) effects of boiler operating conditions on ash deposit formation.

9266 (SAND–95-8474) **Nitrogen release during coal combustion.** Baxter, L.L.; Mitchell, R.E.; Fletcher, T.H.; Hurt, R.H. Sandia National Labs., Livermore, CA (United States). Feb 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95007552. Source: OSTI; NTIS; GPO Dep.

Experiments in entrained flow reactors at combustion temperatures are performed to resolve the rank dependence of nitrogen release on an elemental basis for a suite of 15 U.S. coals ranging from lignite to low-volatile bituminous. Data were obtained as a function of particle conversion, with overall mass loss up to 99% on a dry, ash-free basis. Nitrogen release rates are presented relative to both carbon loss and overall mass loss. During devolatilization, fractional nitrogen release from low-rank coals is much slower than fractional mass release and noticeably slower than fractional carbon release. As coal rank increases, fractional nitrogen release rate relative to that of carbon and mass increases, with fractional nitrogen release rates exceeding fractional mass and fractional carbon release rates during devolatilization for high-rank (low-volatile bituminous) coals. At the onset of combustion, nitrogen release rates increase significantly. For all coals investigated, cumulative fractional nitrogen loss rates relative to those of mass and carbon passes through a maximum during the earliest stages of oxidation. The mechanism for generating this maximum is postulated to involve nascent thermal rupture of nitrogen-containing compounds and possible preferential oxidation of nitrogen sites. During later stages of oxidation, the cumulative fractional loss of nitrogen approaches that of carbon for all coals. Changes in the relative release rates of nitrogen compared to those of both overall mass and carbon during all stages of combustion are attributed to a combination of the chemical structure of coals, temperature histories during combustion, and char chemistry.

9267 (SEI-EED–40) **Efficiency and emissions of coal combustion in two unvented cookstoves.** Kaoma, J. (Building and Industrial Minerals Research Unit, National Council for Scientific Research (Zambia)); Kasali, G.B.; Ellegaard, A. Stockholm Environment Inst. (Sweden). 1994. 39p. Order Number DE95744970. Source: OSTI; NTIS; INIS.

An improved chamber method was employed in the evaluation of the energy conversion and emission characteristics of coal in two unvented cookstoves known as the clay stove and the Maamba stove. Burn rate and stove efficiency were determined together with mission factors for carbon monoxide (CO), nitric oxide (NO) and respirable suspended particulates (RSP). Compared to Maamba stove, the clay stove exhibited a lower burn rate but higher efficiency. The clay stove recorded mean CO, SO_2, NO_2, NO and RSP emission factors of 200, 47, 10, 0.4 and 2.4 g/kg, respectively. The Maamba stove emission factors for the same pollutants were 170, 36, n.d., 1.2 and 8.0 g/kg, respectively. The emissions and concentrations of carbon monoxide were less than those previously found with charcoal use, but still exceeded air pollution guidelines by orders of magnitude. Thus the use of coal would not constitute any appreciable improvement over the present charcoal use. Sulphur dioxide emissions and concentrations are quite high, and would constitute a new pollutant in residential areas of Zambia. Particulate emissions and concentrations from coal are higher than from charcoal. In view of specific health risks associated with particulates from coal smoke the domestic use of raw coal is not recommended. 16 refs, 8 figs, 20 tabs

9268 (DOE/METC–95/1015) **PIMM: A Performance Improvement Measurement Methodology.** USDOE Morgantown Energy Technology Center, WV (United States). 15 May 1994. 61p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95000052. Source: OSTI; NTIS; GPO Dep.

This report presents a Performance Improvement Measurement Methodology (PIMM) for measuring and reporting the mission performance for organizational elements of the U.S. Department of Energy to comply with the Chief Financial Officer's Act (CFOA) of 1990 and the Government Performance and Results Act (GPRA) of 1993. The PIMM is illustrated by application to the Morgantown Energy Technology Center (METC), a Research, Development and Demonstration (RD&D) field center of the Office of Fossil Energy, along with limited applications to the Strategic Petroleum Reserve Office and the Office of Fossil Energy. METC is now implementing the first year of a pilot project under GPRA using the PIMM. The PIMM process is applicable to all elements of the Department; organizations may customize measurements to their specific missions. The PIMM has four aspects: (1) an achievement measurement that applies to any organizational element, (2) key indicators that apply to institutional elements, (3) a risk reduction measurement that applies to all RD&D elements and to elements with long-term activities leading to risk-associated outcomes, and (4) a cost performance evaluation. Key Indicators show how close the institution is to attaining long range goals. Risk reduction analysis is especially relevant to RD&D. Product risk is defined as the chance that the product of new technology will not meet the requirements of the customer. RD&D is conducted to reduce technology risks to acceptable levels. The PIMM provides a profile to track risk reduction as RD&D proceeds. Cost performance evaluations provide a measurement of the expected costs of outcomes relative to their actual costs.

9270 (DOE/PC/92546–T9) **New concept for coal wettability evaluation and modulation. Technical progress report, October 1, 1994–December 31, 1994.** Hu, Weibai. Utah Univ., Salt Lake City, UT (United States). Dept. of Metallurgy and Metallurgical Engineering. [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92546. Order Number DE95007994. Source: OSTI; NTIS; GPO Dep.

This project is concerned with the new concept for coal surface wettability and floatability and modulation. The objective of the work is to study the fundamental surface chemistry features about the evaluation of the surface wettability and floatability of coal and pyrite, and establish a new separation strategy which could contribute to advanced coal-cleaning for premium fuel application.

9271 (DOE/BC/14835–1) **Multiphase flow in fractured porous media.** Firoozabadi, A. Reservoir Engineering Research Inst., Palo Alto, CA (United States). [1995]. 466p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91BC14835. Order Number DE95007231. Source: OSTI; NTIS; GPO Dep.

The major goal of this research project was to improve the understanding of the gas-oil two-phase flow in fractured porous media. In addition, miscible displacement was studied to evaluate its promise for enhanced recovery.

9272 (DOE/BC/14956–7) **Identification and evaluation of fluvial-dominated deltaic (class 1 oil) reservoirs in Oklahoma. Quarterly technical progress report, April 1, 1994–June 30, 1994.** Mankin, C.J. (Oklahoma Geological Survey, Norman, OK (United States)); Banken, M.K. Oklahoma Univ., Norman, OK (United States). 8 Dec 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14956. Order Number DE95005348. Source: OSTI; NTIS; GPO Dep.

The Oklahoma Geological Survey (OGS), the Geological Information Systems department, and the School of Petroleum and Geological Engineering at the University of Oklahoma are engaging in a program to identify and address Oklahoma's oil recovery opportunities in fluvial-dominated deltaic (FDD) reservoirs. This program includes the systematic and comprehensive collection and evaluation of information on all of Oklahoma's FDD reservoirs and the recovery technologies that have been (or could be) applied to those reservoirs with commercial success. This data collection and evaluation effort will be the foundation for an aggressive, multifaceted technology transfer program that is designed to support all of Oklahoma's oil industry, with particular emphasis on smaller companies and independent operators in their attempts to maximize the economic producibility of FDD reservoirs.

9273 (DOE/EI/23624–T1) **An evaluation of accounting-based finding costs as efficiency measures for oil and gas exploration.** Boynton, C.E. IV; Boone, J.P. University of North Texas, Denton, TX (United States). Inst. of Petroleum Accounting. Aug 1994. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-92EI23624. Order Number DE95006396. Source: OSTI; NTIS; INIS; GPO Dep.

The authors have operationalized firm-specific exploration efficiency as the difference between a firm-specific intercept estimated in a fixed-effects panel data Cobb-Douglas production frontier model and the maximum firm-specific intercept estimated in that model. The production model was estimated during two different time periods, 1982–1985 and 1989–1992, allowing efficiency to vary intertemporally. This efficiency estimate served as a benchmark against which they compared various measures of inverse finding costs. They assumed that the degree of association with an efficiency benchmark is an important attribute of any finding cost measure and that, further, the degree of association may be used as a metric for choosing between alternative finding cost measures. Accordingly, they evaluated the cross-sectional statistical association between estimated efficiency and alternative inverse finding cost measures. They discovered that the inverse finding cost measure that exhibited the strongest association with efficiency during the two time periods was a three-year moving-average finding cost which included exploration plus development expenditures as costs and reserve extensions and additions plus revisions as the units added.

9274 (Juel–2923) **Changes in the organic matter in the weathered zone above a petroleum bedrock.** Hormes, F. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Chemie und Dynamik der Geosphaere 4: Erdoel und Organische Chemie; Technische Hochschule Aachen (Germany). Jun 1994. 296p. (In German). Order Number DE95746282. Source: OSTI; NTIS (US Sales Only).

A drill core with a length of 8 m taken from the weathering profile (soil, saprolite, bedrock) of a petroleum bedrock (Posidonian shale, North West Germany) was analyzed for the molecular changes in the organic matter (aromatic hydrocarbons, sulphuric aromatic hydrocarbons, n-alkanes, hopanes, steranes, carbonic acids, alcohols). The concentration of fossil hydrocarbons measured in unweathered Posidonian shale would be unacceptable in soils for reasons of environmental hygiene. The weathering processes, on the other hand, cause a reduction, e.g. in the mostly geogenic C_{15}-C_{24} n-alkanes, from 1200 $\mu g/g$ C_{org} to 41 $\mu g/g$ C_{org} in the top soil horizons, i.e. a 97% reduction. Water-soluble aromatics that are a potential groundwater hazard, e.g. methyl phenanthrenes or methyl napthalenes, are found in the top soil state only in a concentration <1% of the initial concentrations. (orig./EF)

9275 (SAND–95-0142C) **Groundwater flow velocity measurements in a sinkhole at the Weeks Island Strategic Petroleum Reserve Facility, Louisiana.** Ballard, S. (Sandia National Labs., Albuquerque, NM (United States)); Gibson, J. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950450–1: 8. annual symposium on the application of geophysics to environmental and engineering problems, Orlando, FL (United States), 23-27 Apr 1995). Order Number DE95006825. Source: OSTI; NTIS; GPO Dep.

In 1992, a sinkhole was discovered above a Strategic Petroleum Reserve storage facility at Weeks Island, Louisiana. The oil is stored in an old salt mine located within a salt dome. In order to assess the hydrologic significance of the sink hole, an In Situ Permeable Flow Sensor was deployed within a sand-filled conduit in the salt dome directly beneath the sinkhole. The flow sensor is a recently developed instrument which uses a thermal perturbation technique to measure the magnitude and direction of the full 3-dimensional groundwater flow velocity vector in saturated, permeable materials. The flow sensor measured substantial groundwater flow directed vertically downward into the salt dome. The data obtained with the flow sensor provided critical evidence which was instrumental in assessing the significance of the sinkhole in terms of the integrity of the oil storage facility.

9276 (DOE/BC–95/2/SP) **Annex III-evaluation of past and ongoing enhanced oil recovery projects.** USDOE Bartlesville Project Office, OK (United States). Feb 1995. 565p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95000119. Source: OSTI; NTIS; GPO Dep.

The Infill Drilling Predictive Model (IDPM) was developed by Scientific Software-Intercomp (SSI) for the Bartlesville Project Office (BPO) of the United States Department of Energy (DOE). The model and certain adaptations thereof were used in conjunction with other models to support the Interstate Oil and Gas Compact Commission's (IOGCC) 1993 state-by-state assessment of the potential domestic reserves achievable through the application of Advanced Secondary Recovery (ASR) and Enhanced Oil Recovery (EOR) techniques. Funding for this study was provided by the DOE/BPO, which additionally provided technical support. The IDPM is a three-dimensional (stratified, five-spot), two-phase (oil and water) model which uses a minimal amount of reservoir and geologic data to generate production and recovery forecasts for ongoing waterflood and infill drilling projects. The model computes water-oil displacement and oil recovery using finite difference solutions within streamtubes. It calculates the streamtube geometries and uses a two-dimensional reservoir simulation to track fluid movement in each streamtube slice. Thus the model represents a hybrid of streamtube and numerical simulators.

9277 (DOE/BC/14474–17) **Characterization and modification of fluid conductivity in heterogeneous reservoirs to improve sweep efficiency. Final report.** Fogler, H.S. Michigan Univ., Ann Arbor, MI (United States). Feb 1995. 176p. Sponsored

by USDOE, Washington, DC (United States). DOE Contract AC22-89BC14474. Order Number DE95000128. Source: OSTI; NTIS; GPO Dep.

The main objectives of this project were to develop new treatment strategies that would improve the efficiency of oil production, and stimulation procedures. Strategies were developed to treat injection well matrix heterogeneities, production well matrix or saturation heterogeneities, and fractured wells. The treatment strategies investigated included a particulate system, and a foamed gel for injection well profile modification, a foam/acid injection strategy for improving acidization of carbonates, an acid reactive gel for controlling acid leak-off into fractures, and a water reactive gel for water shut-off at production wells. The research focused on discovering the principles governing the performance of the treatment strategies to provide a fundamental basis for further development of these techniques. Other goals of this project were to demonstrate the use of Neutron Imaging for real time imaging of fluid flow through heterogeneous porous media and develop a kinetic model to simulate the effect of diagenetic processes on reservoir porosity and permeability.

9278 (DOE/BC/14651–20) **Reservoir characterization of Pennsylvanian sandstone reservoirs. Final report.** Kelkar, M. Tulsa Univ., OK (United States). Dept. of Petroleum Engineering. Feb 1995. 351p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90BC14651. Order Number DE95000122. Source: OSTI; NTIS; GPO Dep.

This final report summarizes the progress during the three years of a project on Reservoir Characterization of Pennsylvanian Sandstone Reservoirs. The report is divided into three sections: (i) reservoir description; (ii) scale-up procedures; (iii) outcrop investigation. The first section describes the methods by which a reservoir can be described in three dimensions. The next step in reservoir description is to scale up reservoir properties for flow simulation. The second section addresses the issue of scale-up of reservoir properties once the spatial descriptions of properties are created. The last section describes the investigation of an outcrop.

9279 (DOE/BC/14852–10) **Scale-up of miscible flood processes for heterogeneous reservoirs. Second annual report.** Orr, F.M. Jr. Stanford Univ., CA (United States). Dept. of Petroleum Engineering. Mar 1995. 128p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92BC14852. Order Number DE95000132. Source: OSTI; NTIS; GPO Dep.

Progress is reported for a comprehensive investigation of the scaling behavior of gas injection processes in heterogeneous reservoirs. The interplay of phase behavior, viscous fingering, gravity segregation, capillary imbibition and drainage, and reservoir heterogeneity is examined in a series of simulations and experiments. Use of streamtube to model multiphase flow is demonstrated to be a fast and accurate approach for displacements that are dominated by reservoir heterogeneity. The streamtube technique is particularly powerful for multiphase compositional displacements because it represents the effects of phase behavior with a one-dimensional flow and represents the effects of heterogeneity through the locations of streamtubes. A new approach for fast calculations of critical tie-lines directly from criticality conditions is reported. A global triangular structure solution for four-component flow systems, whose tie-lies meet at the edge of a quaternary phase diagram or lie in planes is presented. Also demonstrated is the extension of this solution to multicomponent systems under the same assumptions. The interplay of gravity, capillary and viscous forces on final residual oil saturation is examined experimentally and theoretically. The analysis of vertical equilibrium conditions for three-phase gravity drainage shows that almost all oil can be recovered from the top part of a reservoir. The prediction of spreading and stability of thin film is performed to investigate three-phase gravity drainage mechanisms. Finally, experimental results from gravity drainage of crude oil in the presence of CO_2 suggest that gravity drainage could be an efficient oil recovery process for vertically fractured reservoirs.

9280 (DOE/BC/14860–T1) **Detailed evaluation of the West Kiehl alkaline-surfactant-polymer field project and it's application to mature Minnelusa waterfloods. Annual technical report, January 1993–December 1993.** Pitts, M.J. Surtek, Inc., Golden, CO (United States). [1995]. 209p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93BC14860. Order Number DE95007062. Source: OSTI; NTIS; GPO Dep.

The combination of an interfacial tension agent and a mobility control agent has the potential to produce additional oil beyond a waterflood. The West Kiehl alkaline-surfactant-polymer project is the most advanced application of this chemical enhanced oil recovery technique. The West Kiehl alkaline-surfactant-polymer flood was initiated in September 1987 as a secondary application after primary recovery. A preliminary analysis of the West Kiehl alkaline-surfactant-polymer flood indicates that incremental oil of 20% of the original stock tank oil in place will be produced above waterflooding. The cost of the incremental oil will be less than $2.50 per incremental barrel. A statistical analysis of approximately 120 Minnelusa oil fields in the Powder River Basin indicates that the original stock tank oil in place exceeds one billion barrels. If the enhanced oil recovery technology implemented at West Kiehl field could be successfully applied to these fields, the potential incremental oil recovery would approach 200 million barrels. This project (1) evaluates the geological deposition environment of West Kiehl and adjacent Minneluse sand reservoirs; (2) compares the production performance results of the best geologic and reservoir performance analogs and select two fields for future study; (3) compares the two best field analogs to the west Kiehl field using numerical simulation; (4) predict results of applying the enhancement technology on two mature Minneluse waterflood analog units using engineering and numerical simulation; (5) predict waterflood and polymer flood performance of the West Kiehl field using numerical simulation.

9281 (DOE/BC/14880–10) **Improved techniques for fluid diversion in oil recovery. Second annual report, October 1, 1993–September 30, 1994.** Seright, R.S. New Mexico Petroleum Recovery Research Center, Socorro, NM (United States). Mar 1995. 221p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14880. Order Number DE95000131. Source: OSTI; NTIS; GPO Dep.

This project is directed at reducing water production and increasing oil recovery efficiency. Today, the cost of water disposal is typically between $0.25 and $0.50 per bbl. Therefore, there is a tremendous economic incentive to reduce water production if that can be accomplished without sacrificing hydrocarbon production. Environmental considerations also provide a significant incentive to reduce water production during oilfield operations. This three-year project has two technical objectives. The first objective is to compare the effectiveness of gels in fluid diversion (water shutoff) with those of other types of processes. Several different types of fluid-diversion processes are being compared, including those using gels, foams, emulsions, and particulates. The ultimate goals of these comparisons are to (1) establish which of these processes are most effective in a given application and (2) determine whether aspects of one process can be combined with those of other processes to improve performance. Analyses and experiments are being performed to verify which materials are the most effective in entering and blocking high-permeability zones. The second objective of the project is to identify the mechanisms by which materials (particularly gels) selectively reduce permeability to water more than to oil. Topics covered in this report include (1) comparisons of the use of gels, foams, emulsions, and particulates as blocking agents; (2) propagation of aluminum-citrate-HPAM gels through porous rock; (3) gel properties in fractured systems; (4) gel placement in unfractured anisotropic flow systems; and (5) an investigation of why some gels can reduce water permeability more than oil permeability.

9282 (DOE/BC/14899–20) **A study of Dykstra-Parsons curves.** Souza, A.O. de; Brigham, W.E. Stanford Univ., CA (United States). Petroleum Research Inst. Feb 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93BC14899. Order Number DE95000124. Source: OSTI; NTIS; GPO Dep.

The Dykstra-Parsons method for prediction of oil recovery by water flooding is a well known technique which has been used by the petroleum industry since 1945. The present work carries their study further, solving the same problem of calculating coverage for certain values of permeability variation having water-oil-ratio and

mobility ratio as fixed parameters. The work herein, instead of using 50 layers, uses 200. Also a more precise theoretical approach to the problem is given. Because of these differences the resulting curves are slightly modified. In a second part, the authors deal with empirical simplifications with considerable success. The idea was to collapse the data and curves obtained in the first part into a single curve which covers most of the range of variables commonly seen in reservoir displacements.

9283 (DOE/BC/14953–7) **Increased oil production and reserves from improved completion techniques in the Bluebell Field, Uinta Basin, Utah. Fourth quarterly technical progress report, July 1, 1994–september 30, 1994.** Morgan, C.D. Geological Survey, Salt Lake City, UT (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14953. Order Number DE95005331. Source: OSTI; NTIS; GPO Dep.

Bluebell field ill tile Uinta Basin, Utah, is a rich petroleum reserve. The field has produced over 125 million barrels of oil from the lacustrine rocks of the Green River Formation. Standard completion techniques, which consist of perforating up to thousands of feet of section at one time, have resulted in opening thief, water-producing and non-productive zones. Low recoverabilitv is largely due to the lack of understanding of the relationship between heterolithic facies, reservoir fracture systems and clay migration. These areas were investigated by analyzing over 1,500 feet of core from the Bluebell area. Approximately 60% of the core consists of carbonates and 40% consists of clastics (predominantly sandstones). The carbonate rocks in general have good porosity and randomly oriented, interconnected macrofractures, whereas the macrofractures in the sandstones are more vertical and isolated. The sandstones however, do have the best reservoir capacity due to inherent interparticle porosity. Some shales display overpressured hydro-microfractures. Preliminary analysis of clay types indicates swelling illite-smectite mixed layer clays as well as kaolinite in both the clastic and carbonate rocks. These swelling, clay types combine with the high pour point waxy oils to reduce production efficiency and total recovery.

9284 (NEI-NO–484) **A study of the competitiveness of the UK continental shelf.** Whiteside, H.M. Norsk Petroleumsforening, Oslo (Norway). 1993. 38p. (CONF-9311288–2: ONS '93: Offshore Northern Seas. advanced projects conference, Stavanger (Norway), 23-24 Nov 1993). Order Number DE95755167. Source: OSTI; NTIS.

The conference paper deals with the formulation of a clear framework for the future in order to reduce costs and ensure long term activity on the UK Continental Shelf (UKCS). The paper discusses the background of the activity on the UKCS in terms of reserves, facilities and production, and the nature of the "new area" which now exists on UKCS. The author describes in some detail the initiative which was taken by the UK Minister for Energy to address the demands brought about by these changes i.e. the setting up of a Working Group on UKCS Competitiveness, and the progress made to date. 20 figs.

9285 (NEI-NO–487) **The Ekofisk water injection experience.** Leland, A. (Smedvig A/S (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1993. 11p. (CONF-9311288–5: ONS '93: Offshore Northern Seas. advanced projects conference, Stavanger (Norway), 23-24 Nov 1993). Order Number DE95755170. Source: OSTI; NTIS.

The conference paper deals with a water injection system for enhancing the oil recovery on the Norwegian Ekofisk field. The system is designed for providing an additional 320.000 BPD water injection capacity. The paper gives an overview of the system, project model, contract structure, and project schedule and status. 4 figs.

9286 (NEI-NO–488) **The US field development practice.** Caldwell, K. (Aker Omega, Inc., Houston, TX (United States)). Norsk Petroleumsforening, Oslo (Norway). 1993. 30p. (CONF-9311288–6: ONS '93: Offshore Northern Seas. advanced projects conference, Stavanger (Norway), 23-24 Nov 1993). Order Number DE95755171. Source: OSTI; NTIS.

The Gulf of Mexico (GOM) has supported a thriving offshore oil and gas industry for almost 50 years. Although the deepwater leases hold exciting promise, by almost any standard of measurement the activity in the Gulf of Mexico has peaked, perhaps as much as a decade ago. Still, this industry is a viable one, rich in experience and culture, that may offer much to those who study it in the proper context. This paper focuses on the offshore activities on the Outer Continental Shelf (OCS), the area that falls under the jurisdiction of the Minerals Management Service (MMS) of the US Department of Interior. More specifically, it addresses the OCS of the Gulf of Mexico, those submerged lands that lie beyond the jurisdiction of the coastal states of Texas and Louisiana, a distance of 3 leagues (approximately 9 miles) and 3 miles, respectively. An overview of the Gulf of Mexico offshore oil and gas industry is given, to illustrate the diversity and maturity of the industry, both of which are factors that are essential in defining the philosophy and practices in the GOM, and in the reader's understanding and possible implementation of ideas presented. The various contracting strategies employed by GOM operators are examined, and a representative large project is discussed to give information of the variations in styles available, and their impact on budget and schedule. 3 figs., 7 tabs.

9287 (NEI-NO–489) **New technology and concepts.** Enger, T. (Norsk Hydro A/S (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1993. 31p. (CONF-9311288–7: ONS '93: Offshore Northern Seas. advanced projects conference, Stavanger (Norway), 23-24 Nov 1993). Order Number DE95755172. Source: OSTI; NTIS.

The conference paper focuses on how to utilize existing technology more efficiently on the Norwegian Continental Shelf (NCS). There is an urgent need to improve the competitiveness of the NCS. According to the author, a closer and more efficient cooperation between the Authorities, the operators and the various contractors and suppliers has to be established. Topics are as follow: New technology; the challenge ahead; the new approach; project execution principles and implementation; frame agreements; the Njord field. 16 figs.

9288 (NEI-NO–490) **Implementing large scale new technology.** Ramshaw, R.S. (Conoco Norway Inc., Stavanger (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1993. 12p. (CONF-9311288–8: ONS '93: Offshore Northern Seas. advanced projects conference, Stavanger (Norway), 23-24 Nov 1993). Order Number DE95755173. Source: OSTI; NTIS.

The conference paper deals with the implementation of large scale new technology in offshore field development. The intention of the paper is to draw on Conoco's experience of the building of three TLPs, Hutton, Jolliet and Heidrun, to illustrate some of the general components of implementing radical new technology. 2 figs.

9289 (NEI-NO–491) **Upgrading and utilization of existing infrastructure - Ekofisk.** Holhjem, A. (Phillips Petroleum Co. (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1993. 14p. (CONF-9311288–9: ONS '93: Offshore Northern Seas. advanced projects conference, Stavanger (Norway), 23-24 Nov 1993). Order Number DE95755174. Source: OSTI; NTIS.

The conference paper discusses the operating expenditures and evaluation of a long-term plan in connection with the Ekofisk II development which is to be submitted by the end of 1993. The new Ekofisk Complex would be constructed, in essence, to handle both the processing requirements as well as the oil and gas transportation of the existing complex. According to the author, new platforms are to be constructed which include all the rerouted pipeline tie-ins. The installation opens up the opportunity for further enhancements in reservoir management. The new facilities would most probably be operational by fall 1998. 1 fig.

9290 (CONF-930802–24) **Aniline hydrogenolysis on the Pt(111) single crystal surface: Mechanisms for C-N bond activation.** Huang, S.X. (Univ. of Michigan, Ann Arbor, MI (United States). Dept. of Chemistry); Gland, J.L.; Fischer, D.A. Michigan Univ., Ann Arbor, MI (United States). Dept. of Chemistry. [1993].

4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER14190. From 206. American Chemical Society (ACS) national meeting; Chicago, IL (United States); 22-27 Aug 1993. Order Number DE95006686. Source: OSTI; NTIS; GPO Dep.

Hydrogenolysis of C-N bond on transition metals is a crucial step in hydrodenitrogenation (HDN) reactions. Despite the overall complexity of HDN processes, the details of important surface reactions can be characterized using model reactions of organonitrogen compounds on single crystal model catalysts. The structure and reactivity of well characterized aniline monolayers on the Pt(111) surface both in vacuum and in the presence of hydrogen is discussed here. Adsorption and reactions of aniline were studied by Gland and Somorjai on the Pt(111) and Pt(100) surfaces, and more recently by Benziger's group on the Ni(111) and Ni(100) surfaces. On both Pt and Ni surfaces, aniline π bonds through the aromatic ring with its ring parallel to the substrate surface.

0205 Products and By-Products

9291 (DOE/PC/92116–T5) **Superacid catalysis of light hydrocarbon conversion. Fifth quarterly report, August 25, 1994–December 31, 1994.** Gates, B.C. (Univ. of California, Davis, CA (United States). Dept. of Chemical Engineering and Materials Science). California Univ., Davis, CA (United States); Delaware Univ., Newark, DE (United States). [1994]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93PC92116. Order Number DE95007558. Source: OSTI; NTIS; GPO Dep.

Fe- and Mn-promoted sulfated zirconia (psZ) was used to catalyze the conversion of n-butane at atmospheric pressure, 225–450 C, and n-butane partial pressures in the range of 0.0025–0.01 atm. At temperatures < 225 C, the significant reactions were isomerization and disproportionation; in the range of 225–300 C, these reactions were accompanied by cracking; at temperatures > 350 C, cracking and isomerization occurred. Catalyst deactivation, resulting at least in part from coke formation, was rapid. The primary cracking products were methane, ethane, ethylene, and propylene. The observation of these products along with an ethane/ethylene molar ratio of nearly 1 is consistent with cracking occurring by the Haag-Dessau mechanism. The rate of methane formation from n-butane cracking catalyzed by Fe- and Mn-psZ at 450 C was about 3×10^{-8} mol/(g of catalyst x s); for comparison, the rate of cracking of n-butane catalyzed by HZSM-5 under these conditions was estimated to be 1×10^{-8} mol/(g of catalyst x s). This comparison suggests that the catalytic activity of the psZ at 450 C is about the same as that of the zeolite, although its activity for n-butane isomerization and disproportionation at temperatures < 100 C is orders of magnitude greater than those of zeolites. Thus the indication of superacidity of the psZ does not extend to high temperatures. The results raise questions about the nature of the presumed superacidity: perhaps the acidic sites responsible for the low-temperature catalytic performance of psZ do not exist at the higher temperatures; alternatively, the low-temperature reactions may involve catalyst functions other than the acidic function.

9292 (IFE/KR/E–94/004) **Prediction of the behaviour of a bubble column produced by a broken subsea gas pipeline.** Lindholm, D. Institutt for Energiteknikk, Kjeller (Norway). Dec 1994. 40p. Order Number DE95755136. Source: OSTI; NTIS.

The report presents a study with the focus on the behaviour and physics of a bubble column due to a sudden release of natural gas from a broken subsea pipeline. A two-fluid model is proposed describing the movement of the gas as it leaves the pipe exit providing the information on liquid and gas velocities, and on liquid and gas volume fractions. It is also applicable for a case where both oil and gas are released, e.g. from an uncontrolled hydrocarbon well, but where the flow rate of gas is much greater than that of oil. 37 refs., 30 figs.

9293 (PNL–10358) **Field investigation source area ST58 old Quartermaster service station, Eielson Air Force Base, Alaska.** Liikala, T.L.; Evans, J.C. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 188p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95005939. Source: OSTI; NTIS; INIS; GPO Dep.

Source area ST58 is the site of the old Quartermaster service station at Eielson Air Force Base, Alaska. The source area is one of several Source Evaluation Report sites being investigated by Pacific Northwest Laboratory for the US Air Force as candidates for no further remedial action, interim removal action, or a remedial investigation/feasibility study under a Federal Facilities Agreement. The purpose of this work was to characterize source area ST58 and excavate the most contaminated soils for use in composting treatability studies. A field investigation was conducted to determine the nature and extent of soil contamination. The field investigation entailed a records search; grid node location, surface geophysical, and soil gas surveys; and test pit soil sampling. Soil excavation followed based on the results of the field investigation. The site was backfilled with clean soil. Results from this work indicate close spatial correlation between screening instruments, used during the field investigation and soil excavation, and laboratory analyses. Gasoline was identified as the main subsurface contaminant based on the soil gas surveys and test pit soil sampling. A center of contamination was located near the northcentral portion of the source area, and a center was located in the northwestern corner. The contamination typically occurred near or below a former soil horizon probably as a result of surface spills and leaks from discontinuities and/or breaks in the underground piping. Piping locations were delineated during the surface geophysical surveys and corresponded very well to unscaled drawings of the site. The high subsurface concentrations of gasoline detected in the northwestern corner of the source area probably reflect groundwater contamination and/or possibly floating product.

9294 (SP–94-57) **Fire brigade response in accidents involving LPG - A literature review.** Isaksson, S.; Persson, H. Swedish National Testing and Research Inst., Boraas (Sweden). 1994. 69p. (In Swedish). Order Number DE95745001. Source: OSTI; NTIS.

This report gives advice regarding tactics to be used in accidents involving large tanks containing LPG. It summarizes available techniques on how to protect large LPG tanks against fire-induced failure, including pressure relief valves, insulation and water spray cooling. Included are also references to risk analysis models for assessment of missile, thermal, and overpressure hazards in accidents. Fire brigade responses shall be planned in advance and personnel be trained so that action is undertaken without unnecessary risk for people. 198 refs. 7 figs. 6 tabs

9295 (AAU-OI-MEMO–1994-27) **Price setting under cost uncertainty and menu costs - the case of the Danish petrol market.** Stampe Christensen, M. Aarhus Univ. (Denmark). Oekonomisk Inst. 1994. 37p. Order Number DE95755101. Source: OSTI; NTIS; INIS.

This paper derives the optimal pricing policy for a firm facing menu costs and stochastic production cost. The pricing policy is a boundary pricing policy and numerical comparative static analysis shows how exogenous parameters - the drift and variance of the production cost, the discount factor and the menu costs - affect the boundaries. Analyzing daily data for the Danish petrol price illustrates that a boundary pricing policy indeed has been followed for the period 1988-1992, with occasional shifts in both the desired mark-up and more importantly in the width of the bounds. While the theoretical model can say nothing of the shifts in desired mark-up, changes in the width of the bounds are found to be consistent with the implications of the model. (au)

9296 (CONF-9404236–1) **Twenty years of energy policy: What should we have learned?.** Greene, D.L. (Oak Ridge National Lab., TN (United States). Center for Transportation Analysis).

Oak Ridge National Lab., TN (United States). Jul 1994. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Twenty years of energy policy symposium; Knoxville, TN (United States); 19 Apr 1994. Order Number DE95006388. Source: OSTI; NTIS; INIS; GPO Dep.

This report examines the past twenty years of energy market events and energy policies to determine what may be useful for the future. The author focuses on two important lessons that should have been learned but which the author feels have been seriously misunderstood. The first is that oil price shocks were a very big and very real problem for oil importing countries, a problem the has not gone away. The second is that automobile fuel economy regulation has worked and worked effectively to reduce oil consumption and the externalities associated with it, and can still work effectively in the future.

9297 (DOE/EIA–0109(95/01)) **Petroleum supply monthly, January 1995, with data for November 1994.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. Jan 1995. 151p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006476. Source: OSTI; NTIS; GPO Dep.

Data supplied in the Petroleum Supply Monthly describe the supply and disposition of petroleum products in the United Stated and major U.S. geographic regions. The data series describe production, imports and exports, inter-Petroleum Administration for Defense (PAD) district movements, and inventories by the primary suppliers of petroleum products in the United States.

9298 (DOE/EIA–0380(95/02)) **Petroleum marketing monthly, February 1995 - with data for November 1994.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. Feb 1995. 188p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95007315. Source: OSTI; NTIS; GPO; GPO Dep.

The Petroleum Marketing Monthly (PMM) provides information and statistical data on a variety of crude oils and refined petroleum products. The publication presents statistics on crude oil costs and refined petroleum products sales for use by industry, government, private sector analysts, educational institutions, and consumers. Data on crude oil include the domestic first purchase price, the free on board and landed cost of imported crude oil, and the refiners' acquisition cost of crude oil. Refined petroleum product sales data include motor gasoline, distillates, residuals, aviation fuels, kerosene, and propane. The Petroleum Marketing Division, Office of Oil and Gas, Energy Information Administration ensures the accuracy, quality, and confidentiality of the published data in the PMM.

9299 (DOE/EIA–0538(94/95-16)) **Winter fuels report.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 27 Jan 1995. 77p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006475. Source: OSTI; NTIS; GPO Dep.

The Winter Fuels Report is intended to provide concise, timely information to the industry, the press, policymakers, consumers, analysis, and State and local governments on the following topics: distillate fuel oil net production, imports and stocks on a US level and for all Petroleum Administration for Defense Districts (PADD) and product supplied on a US level; propane net production, imports and stocks on a US level and for PADD's I, II and III; natural gas supply and disposition and underground storage for the US and consumption for all PADD's, as well as selected National average prices; residential and wholesale pricing data for heating oil and propane for those States participating in the joint Energy Information Administration (EIA)/State Heating Oil and Propane Program; crude oil and petroleum price comparisons for the US and selected cities; and a 6-10 Day, 30-Day and 90-Day outlook for temperature and precipitation and US total heating degree-days by city.

The Winter Fuels Report is intended to provide consise, timely information to the industry, the press, policymakers, consumers, analysts, and State and local governments on the following topics: Distillate fuel oil net production, imports and stocks on a US level and for all Petroleum Administration for Defense Districts (PADD) and product supplied on a US level; Natural gas supply and disposition and underground storage for the US and consumption for all PADD's as well as selected National average prices; Residential and wholesale pricing data for heating oil and propane for those States participating in the joint Energy Information Administration (EIA)/State Heating Oil and Propane Program; Crude oil and petroleum price comparisons for the US and selected cities; and A 6-10 Day and 30-Day outlook for temperature and precipitation and US total heating degree days by city.

9301 (NEI-NO–486) **Improved project execution and contract strategies. The Hyde experience.** Murphy, D.L. (Kvaerner Offshore, London (United Kingdom)). Norsk Petroleumsforening, Oslo (Norway). 1993. 12p. (CONF-9311288–4: ONS '93: Offshore Northern Seas. advanced projects conference, Stavanger (Norway), 23-24 Nov 1993). Order Number DE95755169. Source: OSTI; NTIS; INIS.

The conference paper deals with the obtained experience from the Hyde development project on the UK continental shelf. The industry is searching for more effective ways to develop North Sea oil and gas assets. Hyde, like many other projects, was uneconomic using current industry development and operation norms. BP, as a results, challenged its management to change the norms and achieve new levels of performance. The Hyde field was discovered in 1967. At that time, and until late 1991, it was assessed non-commercial. Between discovery and late 1991, gas prices increased in real terms but not as much as capital and operating costs. The initial BP challenge for Hyde was to make it commercial. The paper discusses the sanction phase, the mould breaking, and the project development breakthrough. 2 figs.

0209 Environmental Aspects

9302 (DOE/EA–0954) **Environmental assessment of oil degasification at four Strategic Petroleum Reserve facilities in Texas and Louisiana.** Department of Energy, Washington, DC (United States). Sep 1994. 93p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005155. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) proposes to treat gassy oil at four Strategic Petroleum Reserve (SPR) storage sites to lower the gas content of the stored crude oil and help ensure safe transfer of the oil during drawdown. The crude oil is stored underground in caverns created in salt domes. The degree of gassiness of the oil varies substantially among sites and among caverns within a site. This environmental assessment describes the proposed degasification operation, its alternatives, and potential environmental impacts. The need for degasification has arisen because over time, gases, principally methane and nitrogen, have migrated into and become dissolved in the stored crude oil. This influx of gas has raised the crude oil vapor pressure above limits required by safety and emission guidelines. When oil is drawn from the caverns, excess gases may come out of solution. Based on preliminary data from an ongoing sampling program, between 200 and 350 million of the 587 million barrels of crude oil stored at these four sites would require processing to remove excess gas. Degasification, a commonly used petroleum industry process, would be done at four crude oil storage facilities: Bryan Mound and Big Hill in Texas, and West Hackberry and Bayou Choctaw in Louisiana. DOE would use a turnkey services contract for engineering, procurement, fabrication, installation, operation and maintenance of two degasification plants. These would be installed initially at Bryan Mound and West Hackberry. Degasification would be complete in less than three years of continuous operations. This report summarizes the environmental impacts of this gasification process.

9303 (DOE/MT/94003–1) **Assistance to the states with risk based data management. Quarterly technical progress report, May 20, 1994–September 30, 1994.** Paque, M.J. Underground Injection Practices Council Research Foundation, Oklahoma City, OK

(United States). 29 Oct 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94MT94003. Order Number DE95005310. Source: OSTI; NTIS; GPO Dep.

The following is a quarterly Technical Progress Report of the Risk Based Data Management Systems (RBDMS) project. The project, funded through a United States Department of Energy (DOE) grant is being administered by the Underground Injection Practices Research Foundation (UIPRF) which is the foundation to the Ground Water Protection Council (GWPC). The two tasks of this project are: (I) complete implementation of a risk based data management system in the states of Alaska, Mississippi, Montana, and Nebraska, (II) conduct Area of Revies (AOR) training seminars.

9304 (ORNL/TM–12871) **The Kwajalein bioremediation demonstration: Final technical report.** Walker, J.R. Jr.; Walker, A.B. Oak Ridge National Lab., TN (United States). Dec 1994. 253p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95006491. Source: OSTI; NTIS; INIS; GPO Dep.

The US Army Kwajalein Atoll (USAKA) Base, located in the Republic of the Marshall Islands (RMI) in the east-central Pacific Ocean, has significant petroleum hydrocarbon contamination resulting from years of military activities. Because of its remoteness, the lack of on-site sophisticated remediation or waste disposal facilities, the amenability of petroleum hydrocarbons to biodegradation, and the year-round temperature favorable for microbial activity, USAKA requested, through the Hazardous Waste Remedial Actions Program (HAZWRAP), that a project be conducted to evaluate the feasibility of using bioremediation for environmental restoration of contaminated sites within the atoll. The project was conducted in four distinct phases: (1) initial site characterization and on-site biotreatability studies, (2) selection of the demonstration area and collection of soil columns, (3) laboratory column biotreatability studies, and (4) an on-site bioremediation demonstration. The results of phases (1) and (3) have been detailed in previous reports. This report summarizes the results of phases (1) and (3) and presents phases (2) and (4) in detail.

9305 (SAND–94-2969) **Update of assessment of geotechnical risks, strategic petroleum reserve, Weeks Island site.** Bauer, S.J. (ed.). Sandia National Labs., Albuquerque, NM (United States). Dec 1994. 415p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95005692. Source: OSTI; NTIS; GPO Dep.

This report is a critical reassessment of the geotechnical risks of continuing oil storage at the Weeks Island Strategic Petroleum Reserve site. It reviews all previous risk abatement recommendations, subsequent mitigative actions, and new information. Of increased concern, due to the discovery of a surface levels, is the long term maintainability of the mine as an oil storage repository. Mine operational changes are supported in order to facilitate monitoring of water entry diagnostics. These changes are also intended to minimize the volume in the mine available for water entry. Specific recommendations are made to implement the mine changes.

9306 (DOE/FE–0326) **Strategic Petroleum Reserve. Quarterly report.** USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Strategic Petroleum Reserve. 15 Nov 1994. 14p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006869. Source: OSTI; NTIS; GPO Dep.

This report summarizes the activities undertaken by the Strategic Petroleum Reserve during the third quarter of calendar year 1994. It addresses issues relative to storage facilities in Texas and Louisiana and include information on fill rate; average price of products purchased; current and projected storage capacity of each facility; analyses of existing or anticipated problems with the acquisition and storage or petroleum products; budgets established for the operation of each facility during the quarter and total; and major environmental actions completed, in progress, or anticipated. The report also briefly discusses two problems which have temporarily reduced the Reserve's oil inventory for drawdown. These problems are a higher-than-normal gas content and elevated temperatures of crude at other facilities.

9307 (SAND–94-2964C) **Salt dissolution sinkhole at the Weeks Island, Louisiana, Strategic Petroleum Reserve storage site.** Neal, J.T. (Sandia National Labs., Albuquerque, NM (United States)); Myers, R.E. Sandia National Labs., Albuquerque, NM (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9504100–1: 5. multidisciplinary conference on sinkholes and the engineering and environmental impacts of Karst, Gatlinburg, TN (United States), 1-5 Apr 1995). Order Number DE95004528. Source: OSTI; NTIS; GPO Dep.

A sinkhole was first observed in May 1992 over the outer edge of the two-tiered former salt mine that was converted for oil storage by the US Strategic Petroleum Reserve (SPR). Results of diagnostic studies which included geophysical, geochemical, drilling, and hydrological methods suggest a direct connection exists between the surface collapse area and the underground mine. The connection was confirmed by correlative measurements of sediment slump rates, piezometric surface deflection, and brine influx rates into the mine. The dissolution of salt below the sinkhole that initiated the leak into the mine was likely caused by several confluent geologic processes, and exacerbated by mining-induced stresses that created fractures which severed as hydrologic flowpaths. Modeling studies of mine stresses show that years of tensional stresses may be required before cracking begins to occur, but once begun can continue to develop, and relieve the stress in that specific regime. The crack regime creates the avenue for incursion of groundwater, very slowly initially, but gradually enlarging as undersaturated groundwater dissolves salt on the sides of the crack. Mitigative measures include increasing the mine pressurization, slowing the dissolution by injecting brine into the sinkhole throat, and permeation grouting in hydrologic flowpaths.

9308 (DOE/MC/30070–3996) **Field fracturing multi-sites project. Annual technical progress report, July 28, 1993–July 31, 1994.** CER Corp., Rifle, CO (United States). [1995]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-93MC30070. Order Number DE95006650. Source: OSTI; NTIS; GPO Dep.

The objective of the Field Fracturing Multi-Sites Project (M-Site) is to conduct experiments to definitively determine hydraulic fracture dimensions using remote well and treatment well diagnostic techniques. In addition, experiments will be conducted to provide data which will resolve significant unknowns with regard to hydraulic fracture modeling, fluid fracture rheology and fracture treatment design. These experiments will be supported by a well-characterized subsurface environment, as well as surface facilities and equipment that are conducive to acquiring high-quality data. The goal is to develop a fully characterized, tight reservoir-typical, field-scale hydraulic-fracturing test site.

Contract FG03-94ER14417. Order Number DE95007115. Source: OSTI; NTIS; GPO Dep.

Surface-generated gas-phase radicals, which are the subject of this study, may function as important intermediates in several important partial and complete oxidation reactions. Two examples are the role of CH_3 radicals in the oxidative coupling of CH_4 and the role of OH radicals in the catalytic combustion of CH_4. Although the gas phase chemistry of simple hydrocarbon radicals is reasonably well understood, very little is known about the reactions that occur between these radicals and metal oxide surfaces. Moreover, the formation of hydroxyl radicals over oxides is a largely unexplored area of catalysis. Recent work in the laboratory has been devoted to the reactions of methyl radicals with reactive metal oxides, and the production of hydroxyl radicals under rate limiting conditions. This paper describes reactions of CH_3 radicals with metal oxides; catalytic conversion of CH_3 radicals to CH_3OH and HCHO; identification of surface-generated benzyl radicals; and formation of OH radicals under rate limiting conditions.

9310 (UCRL-CR–119242) **Conversion of methane to higher hydrocarbons (Biomimetic catalysis of the conversion of methane to methanol). Final report.** Watkins, B.E. (and others); Taylor, R.T.; Satcher, J.H. Lawrence Livermore National Lab., CA (United States). Sep 1993. 94p. Sponsored by USDOE, Washington, DC (United States);Gas Research Inst., Chicago, IL (United States). DOE Contract W-7405-ENG-48. Order Number DE95006801. Source: OSTI; NTIS; GPO Dep.

In addition to inorganic catalysts that react with methane, it is well-known that a select group of aerobic soil/water bacteria called methanotrophs can efficiently and selectively utilize methane as the sole source of their energy and carbon for cellular growth. The first reaction in this metabolic pathway is catalyzed by the enzyme methane monooxygenase (MMO) forming methanol. Methanol is a technology important product from this partial oxidation of methane since it can be easily converted to liquid hydrocarbon transportation fuels (gasoline), used directly as a liquid fuel or fuel additive itself, or serve as a feedstock for chemicals production. This naturally occurring biocatalyst (MMO) is accomplishing a technologically important transformation (methane directly to methanol) for which there is currently no analogous chemical (non-biological) process. The authors approach has been to use the biocatalyst, MMO, as the initial focus in the development of discrete chemical catalysts (biomimetic complexes) for methane conversion. The advantage of this approach is that it exploits a biocatalytic system already performing a desired transformation of methane. In addition, this approach generated needed new experimental information on catalyst structure and function in order to develop new catalysts rationally and systematically. The first task is a comparative mechanistic, biochemical, and spectroscopic investigation of MMO enzyme systems. This work was directed at developing a description of the structure and function of the catalytically active sites in sufficient detail to generate a biomimetic material. The second task involves the synthesis, characterization, and chemical reactions of discrete complexes that mimic the enzymatic active site. These complexes were synthesized based on their best current understanding of the MMO active site structure.

9311 (DOE/EIA–0131(93)/S) **Natural gas annual 1993 supplement: Company profiles.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. Feb 1995. 185p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95007128. Source: OSTI; NTIS; GPO; GPO Dep.

The Natural Gas Annual provides information on the supply and disposition of natural gas to a wide audience including industry, consumers, Federal and State agencies, and educational institutions. This report, the Natural Gas Annual 1993 Supplement: Company Profiles, presents a detailed profile of 45 selected companies in the natural gas industry. The purpose of this report is to show the movement of natural gas through the various States served by the companies profiled. The companies in this report are interstate pipeline companies or local distribution companies (LDC's). Interstate pipeline companies acquire gas supplies from company owned production, purchases from producers, and receipts for transportation for account of others. Pipeline systems, service area maps, company supply and disposition data are presented.

9312 (DOE/EIA–0538(94/95-17)) **Winter fuels report.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 3 Feb 1995. 76p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006704. Source: OSTI; NTIS; GPO Dep.

The Winter Fuels Report is intended to provide concise, timely information to the industry, the press, policymakers, consumers, analysts, and State and local governments on the following topics: distillate fuel oil net production, imports and stocks on a US level and for all Petroleum Administration for Defense Districts (PADD) and product supplied on a US level; propane net production, imports and stocks on a US level and for PADD's I, II, and III; natural gas supply and disposition and underground storage for the US and consumption for all PADD's; as well as selected National average prices; residential and wholesale pricing data for heating oil and propane for those States participating in the joint Energy Information Administration (EIA)/State Heating Oil and Propane Program; crude oil and petroleum price comparisons for the US and selected cities; and a 6-10 Day and 30-Day outlook for temperature and precipitation and US total heating degree-days by city.

9313 (DOE/FE–0325) **Natural gas: Imports and exports. Third quarter report 1994.** USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Fuels Programs. [1994]. 186p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005150. Source: OSTI; NTIS; GPO Dep.

The Office of Fuels Programs prepares quarterly reports summarizing the data provided by companies authorized to import or export natural gas. Companies are required, as a condition of their authorizations, to file quarterly reports with the OFP. This report is for the third quarter of 1994 (July–September). Attachment A shows the percentage of takes to maximum firm contract levels and the weighted average per unit price for each of the long-term importers during the five most recent reporting quarters. Attachment B shows volumes and prices of gas purchased by long-term importers and exporters during the past 12 months. Attachment C shows volume and price information pertaining to gas imported on a short-term or spot market basis. Attachment D shows the gas exported on a short-term or spot market basis to Canada and Mexico. During the first nine months of 1994, data indicates gas imports grew by about 13 percent over the 1993 level (1925 vs. 1707 Bcf), with Canadian imports increasingly by 13 percent and Algerian imports decreasing by 17 percent. During the same time period, exports declined by 8 percent (108.6 vs. 117.4 Bcf). Exports to Japan increased 7 percent while exports to Canada decreased 7 percent from the 1993 level (44.2 vs. 41.3 Bcf and 39.3 vs. 42.1 Bcf, respectively). Exports to Mexico declined by 26 percent (25 vs. 34 Bcf).

9314 (DOE/MC/28139–3957) **Development of a gas information system (GASIS). Quarterly report, September–November, 1994.** Hugman, R.H. Energy and Environmental Analysis, Inc., Arlington, VA (United States). Dec 1994. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC28139. Order Number DE95000048. Source: OSTI; NTIS; GPO Dep.

This report summarizes the technical progress on the GASIS project during the quarter from September through November, 1994. The four major tasks which were accomplished included obtaining user input into a natural gas database, develop a source directory of natural gas information, develop a natural gas data system, and technology transfer. Data were researched from gas related databases in various earth science data directories. The contractor also contacted CER in Las Vegas about the availability of rock mechanics data. Other information was collected on tight

gas formations and coalbed methane. Various logs and available information was put together for regions of the Mid-Continent and Gulf Coast regions of the US.

9315 (INIS-BR–3456) **Market study of pipe gas for the Bahia State, Brazil.** Secretaria de Energia, Transportes e Comunicacoes, Salvador, BA (Brazil). Sep 1992. 73p. (In Portuguese). Order Number DE95622031. Source: OSTI; NTIS (US Sales Only); INIS.

The energy market that will be conquered by the natural gas in Bahia State is identified, allowing measure the potentiality of gas industry and the gas supply, that the State will plead to the Federal Government. (C.G.C.).

0308 Environmental Aspects

9316 (DOE/EA–0864) **Environmental assessment for hazardous materials testing at the Liquified Gaseous Fuels Spill Test Facility.** USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Nov 1994. 62p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006844. Source: OSTI; NTIS; INIS; OSTI; NTIS; GPO Dep.

The Department of Energy (DOE) proposes to continue the capability to conduct Spill testing at the Nevada Test Site for the purpose of generating data needed to assess risks from accidental releases of hazardous and toxic materials. The testing would be conducted at the existing Liquefied Gaseous Fuels Spill Test Facility located on Frenchman Flat. The Liquefied Gaseous Fuels Spill Test Facility is located in Area 5, along the eastern edge of the Nevada Test Site, Nye County, Nevada, on the western edge of the desert playa, Frenchman Lake. The establishment of an equivalent facility at another location is not an alternative being considered by the DOE; a comprehensive site selection process in 1983 found Frenchman Flat to be the most suitable site for spill testing of relatively large quantities of hazardous materials. Spill tests were conducted at the site in 1986, 1987, 1988, 1990, 1991, and 1992. The experience gained from these tests, coupled with the documented results of no measurable or noticeable impact to the environment, provides the basis for this assessment. The procedural controls that limit downwind concentrations to predetermined values for each test would allow testing of a wide variety of hazardous materials to continue with the safety and negligible impacts experienced in previous tests. This environmental assessment draws heavily on the very thorough environmental assessment prepared by Lawrence Livermore National Laboratories in 1986, especially for the description of the affected environment. New information has been added regarding the existing environment and current land use.

9317 (GRI–94/0036) **Pipeline corridors through wetlands - impacts on plant communities: Cassadaga Creek Tributary Crossing, Gerry Township, Chautauqua County, New York. Topical report, August 1992–November 1993.** Shem, L.M. (Argonne National Lab., IL (United States)); Van Dyke, G.D.; Zimmerman, R.E. Gas Research Inst., Chicago, IL (United States). Environment and Safety Research Dept. Dec 1994. 65p. Sponsored by Gas Research Inst., Chicago, IL (United States). DOE Contract W-31109-ENG-38. Order Number DE95005399. Source: OSTI; NTIS; GPO Dep.

The goal of the Gas Research Institute Wetland Corridors Program is to document impacts of existing pipelines on the wetlands they traverse. To accomplish this goal, 12 existing wetland crossings were surveyed. These sites varied in elapsed time since pipeline construction, wetland type, pipeline installation techniques, and right-of-way (ROW) management practices. This report presents the results of a survey conducted over the period of August 3-4, 1992, at the Cassadaga wetlands crossing in Gerry Township, Chautauqua County, New York. The pipeline at this site was installed during February and March 1981. After completion of pipeline installation, the ROW was fertilized, mulched, and seeded with annual ryegrass. Two adjacent sites were surveyed in this study: a forested wetland and an emergent wetlands Eleven years after pipeline installation, the ROW at both sites supported diverse vegetative communities. Although devoid of large woody species, the ROW within the forested wetland had a dense vegetative cover. The ROW within the emergent wetland had a slightly less dense and more diverse vegetative community compared with that in the adjacent natural areas (NAs). The ROW within the emergent wetland also had a large number of introduced species that were not present in the adjacent NAs. The ROW, with its emergent marsh plant community, provided habitat diversity within the forested wetlands Because the ROW contained species not found within the adjacent NAs, overall species diversity was increased.

9318 (GRI–94/0038) **Pipeline corridors through wetlands - impacts on plant communities: Deep Creek and Brandy Branch crossings, Nassau County, Florida.** Shem, L.M.; Van Dyke, G.D.; Zimmerman, R.E. Argonne National Lab., IL (United States). Dec 1994. 73p. Sponsored by Gas Research Inst., Chicago, IL (United States). DOE Contract W-31109-ENG-38. Order Number DE95006751. Source: OSTI; NTIS; GPO Dep.

The goal of the Gas Research Institute Wetland Corridors Program is to document impacts of existing pipelines on the wetlands they traverse. To accomplish this goal, 12 existing wetland crossings were surveyed. These sites varied in elapsed time since pipeline construction, wetland type, pipeline installation techniques, and right-of-way (ROW) management practices. This report presents the results of surveys conducted July 14-18, 1992, at the Deep Creek and the Brandy Branch crossings of a pipeline installed during May 1991 in Nassau County, Florida. Both floodplains supported bottomland hardwood forests. The pipeline at the Deep Creek crossing was installed by means of horizontal directional drilling after the ROW had been clear-cut, while the pipeline at the Brandy Branch crossing was installed by means of conventional open trenching. Neither site was seeded or fertilized. At the time of sampling, a dense vegetative community, made up primarily of native perennial herbaceous species, occupied the ROW within the Deep Creek floodplain. The Brandy Branch ROW was vegetated by a less dense stand of primarily native perennial herbaceous plants. Plant diversity was also lower at the Brandy Branch crossing than at the Deep Creek crossing. The results suggest that some of the differences in plant communities are related to the more hydric conditions at the Brandy Branch floodplain.

9319 (GRI–94/0435) **Pipeline corridors through wetlands - summary of seventeen plant-community studies at ten wetland crossings. Topical report, February 1990–August 1994.** Van Dyke, G.D. (Argonne National Lab., IL (United States)); Shem, L.M.; Wilkey, P.L.; Zimmerman, R.E.; Alsum, S.K. Gas Research Inst., Chicago, IL (United States). Environment and Safety Research Dept. Dec 1994. 96p. Sponsored by Gas Research Inst., Chicago, IL (United States). Contract 5088-252-1770. Source: OSTI; Gas Research Institute, 8600 West Bryn Mawr Ave., Chicago, IL 60631 (United States).

As part of the Gas Research Institute Wetland Corridors Program, Argonne National Laboratory conducted field studies on 10 wetland crossings located in six states to document impacts of natural gas pipeline rights-of-way (ROWS) on 15 wetland plant communities. This study is unique in the number, range, ages, and variety of wetland crossings surveyed and compared. Vegetation data and recorded observations were analyzed to reveal patterns associated with age, installation technology, maintenance practices, and wetland type. This report summarizes the findings of this study. Results revealed that ROWs of pipelines installed according to recent wetland regulations rapidly revegetated with dense and diverse plant communities. The ROW plant communities were similar to those in the adjacent natural areas in species richness, wetland indicator values, and percentages of native species. The ROW plant communities developed from naturally available propagules without fertilization, liming, or artificial seeding. ROWs contributed to increased habitat and plant species diversity in the wetland. There was little evidence that they degrade the wetland by providing avenues for the spread of invasive and normative plant species. Most impacts are temporal in nature, decreasing rapidly during the first several years and more slowly thereafter to the extent permitted by maintenance and other ROW activities.

9320 (ETDE-DE–23, pp. 20-27) **Industrial automation systems control underground stores of natural gas. Remote control for three underground stores.** Staufenbiel, J. Ruhrgas AG, Essen (Germany). Dec 1992. 45p. (In German). In *Ruhrgas forum. Edition 4. 1992. Reports from science and technology.* Order Number DE95745742. Source: OSTI; NTIS (US Sales Only).

Microprocessor-based automation systems widely used in industry can also be employed for complex processes such as underground storage of natural gas for easy centralized process control. Automatic coordination of plant components, storage field control using a storage schedule and condensing process data allow storage facilities to be operated on the basis of minimum technical data. This makes it possible to run a number of storage facilities from centralized regional control rooms. This concept was first implemented by Ruhrgas AG for the so-called 'storage triangle', involving the storage facilities of Haehnlein, Sandhausen and Stockstadt. Central control stations are also planned for a number of other storage facilities. Following a full assessment of initial operational experience, it may become feasible to operate all Ruhrgas AG storage facilities from the central grid control room at Essen, as has been the case for the compressor stations in the pipeline grid for more than 20 years. The goal of the Gas Research Institute Wetland Corridors Program is to identify representative impacts of existing pipelines on the wetlands they traverse. To accomplish this goal, 12 existing wetland crossings were surveyed. These sites varied in elapsed time since pipeline construction, wetland type, pipeline installation techniques, and right-of-way (ROW) management practices. This report presents the results of the survey July 1992, at the Mills Creek tributary crossing, Jefferson County, New York. Data were collected from three wetland communities along the 1991 pipeline and compared with predisturbance data obtained in a June 1991 survey. Within one year after pipeline installation, 50% of the soil surface of the ROW in the scrub-shrub community was covered by emergent vegetation. Average wetland values for the ROW in 1992 were lower than in 1991, indicating that the removal of woody plants resulted in a community composed of species with greater fidelity to wetlands. In the emergent marsh community after one year, the average percentage of surface covered by standing water was greater in the ROW than in the adjacent natural areas. The ROW in the forested wetland community also contained standing water, although none was found in the natural forest areas. The entire study site remains a wetland, with the majority of plant species in all sites being either obligate or facultative wetland species. Weighted and unweighted average wetland indices for each community, using all species, indicated wetland vegetation within the newly established ROW.

9327 (HW–18406) **Chemical and physical properties vs degree of concentration of uranyl nitrate-nitric acid process streams of metal conversion plant.** Clagett, F. Hanford Works, Richland, WA (United States). 24 Jul 1950. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95002480. Source: OSTI; NTIS; GPO Dep.

Uranium is recovered as an aqueous solution of uranyl nitrate and nitric acid in both the tributyl phosphate metal recovery process and the Redox separation process. The streams are designated as RCU and IIIEU in the respective processes. For metal recovery these streams are combined. The purpose of the nitric removal operation is to minimize equipment corrosion and to restrict contamination of the final uranium oxide with corrosion products which might be formed in the elevated temperature reactor

employed for the decomposition of uranyl nitrate to the oxide. Because of the large quantities of uranium being processed it is desirable to conduct the concentration of the combined RCU and IIIEU streams in a continuous type process to reduce the operating and fixed charges. Determination of the physical and chemical properties of the dilute aqueous uranyl nitrate – nitric acid system, as it progresses toward an essentially nitric acid free concentrated state, is necessary to define the optimum operating conditions.

Source: OSTI; NTIS; INIS; GPO Dep.

Hydrogen isotopes are separated from other gases by permeation through palladium and palladium-silver alloy diffusers in the Tritium Facilities at the US Department of Energy Savannah River Site (SRS). Diffusers have provided effective service for almost forty years. This paper is an overview of the operational experience with the various diffuser types that have been employed at SRS. Alternative technologies being developed at SRS for purifying hydrogen isotopes are also discussed.

9331 (WSRC-MS–95-0083P) **Tritium Processing and Containment Practices at the Savannah River Site.** Buley, R.D.; Green, D.J.; Metzler, J. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. 9332 (BARC–1994/E/023) **Tri butyl phosphate process for actinide partitioning from high level wastes.** Chitnis, R.R. (Bhabha Atomic Research Center, Bombay (India). Process Engineering and Systems Development Division); Deshingkar, D.S.; Jahagirdar, P.B.; Wattal, P.K.; Theyyunni, T.K. Bhabha Atomic Research Centre, Bombay (India). 1994. 48p. Order Number DE95617360. Source: OSTI; NTIS (US Sales Only); INIS.

Partitioning of actinides from High Level Wastes (HLW) arising from fuel reprocessing plants prior to their immobilisation in vitreous matrices would reduce the long term hazards of the vitreous waste product. Actinide partitioning studies based on solvent extraction were carried out on simulated HLW solutions using tri-n-butyl phosphate (TBP) as an extractant. Study on extraction of americium was taken up as an example in this case. Extraction of americium from HLW by TBP requires low acidity and presence of salting out agents. It was shown that americium can be effectively partitioned even from HLW solutions with high acidity using higher concentrations of TBP, higher organic to aqueous phase ratios and proper salting out agents. Counter-current experiments using mixer-settlers were conducted to assess the process feasibility. (author). 16 refs., 8 figs., 7 tabs.

9333 (ORNL/M–2733/R1) **The ORNL Chemical Technology Division, 1950-1994.** Jolley, R.L.; Genung, R.K.; McNeese, L.E.; Mrochek, J.E. Oak Ridge National Lab., TN (United States). Oct 1994. 355p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95006495. Source: OSTI; NTIS; GPO Dep.

This document attempts to reconstruct the role played by the Chemical Technology Division (Chem Tech) of the Oak Ridge National Laboratory (ORNL) in the atomic era since the 1940's related to the development and production of nuclear weapons and power reactors. Chem Tech's early contributions were landmark pioneering studies. Unknown and dimly perceived problems like chemical hazards, radioactivity, and criticality had to be dealt with. New chemical concepts and processes had to be developed to test the new theories being developed by physicists. New engineering concepts had to be developed and demonstrated in order to build facilities and equipment that had never before been attempted. Chem Tech's role was chemical separations, especially uranium and plutonium, and nuclear fuel reprocessing. With diversification of national and ORNL missions, Chem Tech undertook R&D studies in many areas including biotechnology; clinical and environmental chemistry; nuclear reactors; safety regulations; effective and safe waste management and disposal; computer modeling and informational databases; isotope production; and environmental control. The changing mission of Chem Tech are encapsulated in the evolving activities.

9334 (RISO-R–750(EN)) **Analysis and prognosis of radiation exposure following the accident at the Siberian chemical combine Tomsk-7.** Vakulovski, S.M. (Scientific Production Association Thyphoon (Russian Federation)); Shershakov, V.M.; Borodin, R.V.; Vozzhennikov, O.I.; gaziev, Y.I.; Kosykh, V.S.; Makhon'ko, K.P.; Chumichev, V.B. Risoe National Lab., Roskilde (Denmark). Meteorology and Wind Energy. Oct 1994. 47p. Order Number DE95619814. Source: OSTI; NTIS; INIS.

On the basis of the work (ground investigations and gamma aerial surveys) carried out jointly by the Rosgidromet organizations and Berezovgeologiya, data on the radiation exposure in Russia were obtained shortly after the accident of April 6, 1993 already. These data were transmitted to interested institutions. The measurements performed on April 11 and 12, 1993 indicated that within the isolines of 10 μR/h a contaminated area of up to 25 km in length and up to 6 km in width extended towards the northeastern direction. Thus, the contaminated area outside of the premises of the combine covered about 100 km^2. The total amount of radioactive substances in this area was 530 - 590 Ci. Isotope composition of the radioactive trace was determined by ruthenium-103 (1%), ruthenium-106 (31%), zirconium-95 (22%), niobium-95 (45%) and plutonium-239 (0.02%). Contamination heterogeneity is caused by the existence of 'hot' particles with an activity of up to 10-11 Ci/particle. In the contaminated area the gamma exposure rate varied between 14 and 42 μR/h at 1 m height, yielding the maximum external radiation dose 100 mrem/year for the population of

Georgievka. The Pu-239 inhalation dose of the population of Georgievka when passing the radioactive cloud did not exceed 1.5 mrem. A prognosis was made with regard to water contamination of the rivers Samuska and Tom during the flood in spring. Furthermore, contamination of the air layer adjacent to the ground resulting from the wind transport of radionuclides in the summer months at Georgievka was predicted. The values were far below the limits fixed according to the valid radiation protection regulations. However, that radionuclide concentration of the snow water may exceed the limits specified for drinking water. According to the data measured by the meteorological stations, the radioactive products were not entrained beyond the borders of the country.

9335 (WHC-SA–2549) **Independent assessment to continue improvement: implementing statistical process control at the Hanford Site.** Hu, T.A.; Lo, J.C. Westinghouse Hanford Co., Richland, WA (United States). Nov 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950269–1: 4. annual quality audit conference, Baltimore, MD (United States), 23-24 Feb 1995). Order Number DE95005160. Source: OSTI; NTIS; INIS; GPO Dep.

A Quality Assurance independent assessment has brought about continued improvement in the PUREX Plant surveillance program at the Department of Energy's Hanford Site. After the independent assessment, Quality Assurance personnel were closely involved in improving the surveillance program, specifically regarding storage tank monitoring. The independent assessment activities included reviewing procedures, analyzing surveillance data, conducting personnel interviews, and communicating with management. Process improvement efforts included: (1) designing data collection methods; (2) gaining concurrence between engineering and management, (3) revising procedures; and (4) interfacing with shift surveillance crews. Through this process, Statistical Process Control (SPC) was successfully implemented and surveillance management was improved. The independent assessment identified several deficiencies within the surveillance system. These deficiencies can be grouped into two areas: (1) data recording and analysis and (2) handling off-normal conditions. By using several independent assessment techniques, Quality Assurance was able to point out program weakness to senior management and present suggestions for improvements. SPC charting, as implemented by Quality Assurance, is an excellent tool for diagnosing the process, improving communication between the team members, and providing a scientific database for management decisions. In addition, the surveillance procedure was substantially revised. The goals of this revision were to (1) strengthen the role of surveillance management, engineering and operators and (2) emphasize the importance of teamwork for each individual who performs a task. In this instance we believe that the value independent assessment adds to the system is the continuous improvement activities that follow the independent assessment. Excellence in teamwork between the independent assessment organization and the auditee is the key to continuing improvement.

This paper provides estimates of the quantities and types of foreign research reactor spent nuclear fuel containing HEU and LEU of US-origin that are anticipated during the period beginning in January 1996 and extending for 10-15 years.

9338 (CONF-941207–20) **Issues relating to spent nuclear fuel storage on the Oak Ridge Reservation.** Klein, J.A.; Turner, D.W. Oak Ridge National Lab., TN (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Spent nuclear fuel meeting: challenges and initiatives; Salt Lake City, UT (United States); 14-16 Dec 1994. Order Number DE95006386. Source: OSTI; NTIS; INIS; GPO Dep.

Currently, about 2,800 metric tons of spent nuclear fuel (SNF) is stored in the US, 1,000 kg of SNF (or about 0.03% of the nation's total) are stored at the US Department of Energy (DOE) complex in Oak Ridge, Tennessee. However small the total quantity of material stored at Oak Ridge, some of the material is quite singular in character and, thus, poses unique management concerns. The various types of SNF stored at Oak Ridge will be discussed including: (1) High-Flux Isotope Reactor (HFIR) and future Advanced Neutron Source (ANS) fuels; (2) Material Testing Reactor (MTR) fuels, including Bulk Shielding Reactor (BSR) and Oak Ridge Research Reactor (ORR) fuels; (3) Molten Salt Reactor Experiment (MSRE) fuel; (4) Homogeneous Reactor Experiment (HRE) fuel; (5) Miscellaneous SNF stored in Oak Ridge National Laboratory's (ORNL's) Solid Waste Storage Areas (SWSAs); (6) SNF stored in the Y-12 Plant 9720-5 Warehouse including Health. Physics Reactor (HPRR), Space Nuclear Auxiliary Power (SNAP-) 10A, and DOE Demonstration Reactor fuels.

9339 (FEMP–2350) **Rail transportation of Fernald remediation waste.** Fellman, R.T.; Lojek, D.A.; Motl, G.P.; Weddendorf, W.K. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. 24 Jan 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950216–21: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95007211. Source: OSTI; NTIS; INIS; GPO Dep.

Remediation of the Department of Energy (DOE) Fernald site located north of Cincinnati will generate large quantities of low-level radwaste. This volume includes approximately 1,050,000 tons of material to be removed from eight waste pits comprising Operable Unit 1 (OU-1). The remedial alternative selected includes waste material excavation, drying and transportation by rail to a burial site in the arid west for disposal. Rail transportation was selected not only because rail transportation is safer than truck transportation, but also because of the sheer magnitude of the project and the availability of bulk rail car unloading facilities at a representative disposal site. Based upon current waste quantity estimates as presented in the Feasibility Study for OUI, a fully-loaded 47-car unit train would depart the Fernald site weekly for five years. This paper illustrates the steps taken to obtain agency and public acceptance of the Record of Decision for the remedy which hinged on rail transportation. A preliminary, but detailed, rail transportation plan was prepared for the project to support a series of CERCLA public meetings conducted in late 1994. Some of the major issues addressed in the plan included the following: (1) Scope of project leading to selection of rail transportation; (2) Waste classification; (3) Rail Company overview; (4) Train configuration and rail car selection; (5) Routing; (6) Safety; (7) Prior Notification Requirements (8) Emergency Response. A series of three public meetings identified a number of issues of prime concern to Fernald stakeholders. Following resolution of these issues during the public comment period, a Record of Decision (ROD) approving implementation of the rail transportation strategy was approved pending incorporation of EPA and State of Ohio comments on December 22, 1994.

9340 (FEMP–2403) **Low level waste shipment accident lessons learned.** Rast, D.M.; Rowe, J.G.; Reichel, C.W. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950216–19: Waste management '95, Tucson, AZ (United States), 26 Feb - 2

mar 1995). Order Number DE95006173. Source: OSTI; NTIS; INIS; GPO Dep.

On October 1, 1994 a shipment of low-level waste from the Fernald Environmental Management Project, Fernald, Ohio, was involved in an accident near Rolla, Missouri. The accident did not result in the release of any radioactive material. The accident did generate important lessons learned primarily in the areas of driver and emergency response communications. The shipment was comprised of an International Standards Organization (ISO) container on a standard flatbed trailer. The accident caused the low-level waste package to separate from the trailer and come to rest on its top in the median. The impact of the container with the pavement and median inflicted relatively minor damage to the container. The damage was not substantial enough to cause failure of container integrity. The success of the package is attributable to the container design and the packaging procedures used at the Fernald Environmental Management Project for low-level waste shipments. Although the container survived the initial wreck, is was nearly breached when the first responders attempted to open the ISO container. Even though the container was clearly marked and the shipment documentation was technically correct, this information did not identify that the ISO container was the primary containment for the waste. The lessons learned from this accident have DOE complex wide applicability. This paper is intended to describe the accident, subsequent emergency response operations, and the lessons learned from this incident.

9341 (IAEA-TECDOC–764) **Interfaces between transport and geological disposal systems for high level radioactive waste and spent nuclear fuel.** International Atomic Energy Agency, Vienna (Austria). Sep 1994. 49p. Order Number DE95612705. Source: OSTI; NTIS (US Sales Only); INIS.

This document is an IAEA publication which identifies and discusses the interfaces and the interface requirements between high level waste, the waste transport system used for carriage of the waste to the disposal facility, and the high level waste disposal facility. The development of this document was prompted in part by the initiatives in various Member States to select, characterize and design the facilities for potential high level waste geological repositories. These initiatives have progressed to the point where an international document would be useful in calling attention to the need for establishing, in a systematic way, interfaces and interface requirements between the transport systems to be used and the waste disposal packages and geological repository. Refs, figs and tabs.

9342 (INIS-mf–14469, pp. 105-106) **Safe Transport of radioactive materials and other activities.** Elshinawy, M.K.R. Atomic Energy Establishment, Cairo (Egypt). 1991. 106p. (In Arabic). (CONF-9110549–: 2. radiation protection and Civil Defence Department Conference, Cairo (Egypt), 7-16 Oct 1991). In *Radiation Protection and Civil defence Department Conference.* Order Number DE95617966. Source: OSTI; NTIS (US Sales Only); INIS.

This report deals with the different activities in the area of safe transport of radioactive materials. Description of the aim of IAEA safe transport of radioactive materials committees are given. The IAEA committees dealing with transport of radioactive materials are: 1- standing adversary group for safe transport of radioactive materials. (sags tram) and 2- revision of the safe transport of radioactive materials (rest ram). The technical and protective measures taken during transport of radioactive materials through the vital pass way, Suez canal are mentioned. During the period from january to june 1991, the number of vessels crossing the Suez canal and carrying on board radioactive materials of different types, were 44 vessels of different nationalities. The total activity transported was 76.340 TBq (2.063 k Ci). Also the protective measures taken during the transportation of the large radioactive gamma-irradiator, from alexandria port to the national center for radiation research and technology (NCRRT) [Co-60, 366/TBq (98940 k Ci)] were mentioned. Other radiation protection activities mentioned in the report are in the fields of:- 1. safe storage and handling of radioactive materials inside and outside inshas site, 2. assessment of radioactivity in imported foodstuff, 3. emergency response during the gulf war, 4. monitoring of radiation levels in the egyptian environment, and 5. training and supervision in the field of radiation protection. 2 tabs.

9343 (PNL–10249) **Transportation impact analysis for shipment of irradiated N-reactor fuel and associated materials.** Daling, P.M.; Harris, M.S. Pacific Northwest Lab., Richland, WA (United States). Dec 1994. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95005438. Source: OSTI; NTIS; INIS; GPO Dep.

An analysis of the radiological and nonradiological impacts of highway transportation of N-Reactor irradiated fuel (N-fuel) and associated materials is described in this report. N-fuel is proposed to be transported from its present locations in the 105-KE and 105-KW Basins, and possibly the PUREX Facility, to the 327 Building for characterization and testing. Each of these facilities is located on the Hanford Site, which is near Richland, Washington. The projected annual shipping quantity is 500 kgU/yr for 5 years for a total of 2500 kgU. It was assumed the irradiated fuel would be returned to the K- Basins following characterization, so the total amount of fuel shipped was assumed to be 5000 kgU. The shipping campaign may also include the transport and characterization of liquids, gases, and sludges from the storage basins, including fuel assembly and/or canister parts that may also be present in the basins. The impacts of transporting these other materials are bounded by the impacts of transporting 5000 kgU of N-fuel. This report was prepared to support an environmental assessment of the N-fuel characterization program. The RADTRAN 4 and GENII computer codes were used to evaluate the radiological impacts of the proposed shipping campaign. RADTRAN 4 was used to calculate the routine exposures and accident risks to workers and the general public from the N-fuel shipments. The GENII computer code was used to calculate the consequences of the maximum credible accident. The results indicate that the transportation of N-fuel in support of the characterization program should not cause excess radiological-induced latent cancer fatalities or traffic-related nonradiological accident fatalities. The consequences of the maximum credible accident are projected to be small and result in no excess latent cancer fatalities.

9344 (PNL–10260) **Financial assistance to States and tribes to support emergency preparedness and response and the safe transportation of hazardous shipments.** Bradbury, J.A.; Jones, M.L. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 82p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95006239. Source: OSTI; NTIS; INIS; GPO Dep.

This report identifies and summarizes existing sources of financial assistance to States and Indian tribes in preparing and responding to transportation emergencies and ensuring the safe transportation of hazardous shipments through their jurisdictions. The report has been prepared as an information resource for the US Department of Energy's Office of Environmental Restoration and Waste Management, Office of Transportation, Emergency Management and Analytical Services. The report discusses funding programs administered by the following Federal agencies: Federal Emergency Management Agency; Department of Transportation; the Environmental Protection Agency; and the Department of Energy. Also included is a summary of fees assessed by some States on carriers of hazardous materials and hazardous waste. The discussion of programs is supplemented by an Appendix that provides a series of tables summarizing funding sources and amounts. The report includes several conclusions concerning the level of funding provided to Indian tribes, the relative ranking of funding sources and the variation among States in overall revenues for emergency response and safe transportation.

9345 (PNL-SA–24585) **Basis for assessing the movement of spent nuclear fuels from wt to dry storage at the Idaho Chemical Processing Plant.** Guenther, R.J. (Pacific Northwest Lab., Richland, WA (United States)); Gilbert, E.R.; Johnson, A.B.; Lund, A.L.; Pednekar, S.P.; Windes, W.E. Pacific Northwest Lab., Richland, WA (United States). Dec 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941207–21: Spent nuclear fuel meeting:

challenges and initiatives, Salt Lake City, UT (United States), 14-16 Dec 1994). Order Number DE95007163. Source: OSTI; NTIS; INIS; GPO Dep.

An assessment of the possible material interactions arising from the movement of previously wet stored spent nuclear fuel (SNF) into long-term dry interim storage has been conducted for selected fuels in the Idaho Chemical Processing Plant (ICPP). Three main classes of fuels are addressed: aluminum (Al) clad, stainless steel (SS) clad, and unclad Uranium-Zirconium Hydride (UZrHx) fuel types. Degradation issues for the cladding, fuel matrix material, and storage canister in both wet and dry storage environments are assessed. Possible conditioning techniques to stabilize the fuel and optimum dry environment conditions during storage are also addressed.

9346 (WHC-EP–0795) **Spent nuclear fuels project characterization data quality objectives strategy.** Lawrence, L.A. (Pacific Northwest Lab., Richland, WA (United States)); Thornton, T.A.; Redus, K.S. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005476. Source: OSTI; NTIS; INIS; GPO Dep.

A strategy is presented for implementation of the Data Quality Objectives (DQO) process to the Spent Nuclear Fuels Project (SNFP) characterization activities. Westinghouse Hanford Company (WHC) and the Pacific Northwest Laboratory (PNL) are teaming in the characterization of the SNF on the Hanford Site and are committed to the DQO process outlined in this strategy. The SNFP characterization activities will collect and evaluate the required data to support project initiatives and decisions related to interim safe storage and the path forward for disposal. The DQO process is the basis for the activity specific SNF characterization requirements, termed the SNF Characterization DQO for that specific activity, which will be issued by the WHC or PNL organization responsible for the specific activity. The Characterization Plan prepared by PNL defines safety, remediation, and disposal issues. The ongoing Defense Nuclear Facility Safety Board (DNFSB) requirement and plans and the fuel storage and disposition options studies provide the need and direction for the activity specific DQO process. The hierarchy of characterization and DQO related documentation requirements is presented in this strategy. The management of the DQO process and the means of documenting the DQO process are described as well as the tailoring of the DQO process to the specific need of the SNFP characterization activities. This strategy will assure stakeholder and project management that the proper data was collected and evaluated to support programmatic decisions.

9347 (WHC-EP–0830-Vol.3) **Hanford spent nuclear fuel project recommended path forward, volume III: Alternatives and path forward evaluation supporting documentation.** Fulton, J.C. Westinghouse Hanford Co., Richland, WA (United States). Oct 1994. 119p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006835. Source: OSTI; NTIS; INIS; GPO Dep.

Volume I of the Hanford Spent Nuclear Fuel Project - Recommended Path Forward constitutes an aggressive series of projects to construct and operate systems and facilities to safely retrieve, package, transport, process, and store K Basins fuel and sludge. Volume II provided a comparative evaluation of four Alternatives for the Path Forward and an evaluation for the Recommended Path Forward. Although Volume II contained extensive appendices, six supporting documents have been compiled in Volume III to provide additional background for Volume II.

9348 (WHC-SA–2609) **In situ characterization of metal fuel stored in the Hanford K Basins.** Makenas, B.J.; Omberg, R.P.; Lawrence, L.A. Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950216–32: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95006885. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford K Basins contain roughly 2,000 tons of uranium metal fuel previously irradiated in N Reactor. Current plans call for the fuel to be moved to a new storage location in the next few years. This paper describes near term activities to gather data on the mechanical condition and chemical state of the fuel and associated sludge. These on-going in-situ, nondestructive, examinations are intended to complement hot cell examinations which are planned for the near future. Characterization data will feed decisions on interim storage, long term storage and the environmental documentation process as the fuel is relocated. Several techniques have been, or are planned to be, employed during the conduct of examinations in the K Basins. (1) A video survey using underwater cameras has been made for the open top canisters which hold fuel in the K East Basin. These data have given early assessments of cladding degradation, canister corrosion, fuel swelling, and canister/fuel interactions; (2) Ultrasonic measurements of the water level in gas traps connected to sealed canisters have been used to provide indications of gas generation in or water leakage into the canisters; (3) Sampling of gas and water from closed canisters of fuel in the K West Basin will furnish indications of fuel corrosion, fission product release, and canister integrity and will guide choices of fuel to be retrieved for detailed hot cell examinations; (4) Depth measurements and qualitative properties assessments for the sludge on the floor of the basins and in the bottom of canisters have been made using underwater video techniques.

9349 (WHC-SD-CP-ES–165) **Alternatives for the disposition of fuel stored in the PUREX facility.** Enghusen, M.B.; Gore, D.B. Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006882. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides an evaluation of five alternatives for the disposition of 3.4 metric tons of irradiated fuel from PUREX to support facility turnover following deactivation. The alternatives for disposition of the fuel include transfer to the K Basins, transfer to T Plant, passivation and dry vault storage, and dissolution and underground tank storage. The five alternatives were compared and it was determined that the fuel should be transferred from PUREX to the K Basins where it would be placed into pool storage.

9350 (WHC-SD-SNF-CR–002) **Design criteria document, Maintenance Shop/Support Facility, K-Basin Essential Systems Recovery, Project W-405.** Strehlow, M.W.B. Westinghouse Hanford Co., Richland, WA (United States). 14 Dec 1994. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005136. Source: OSTI; NTIS; INIS; GPO Dep.

During the next 10 years a substantial amount of work is scheduled in the K-Basin Area related to the storage and eventual removal of irradiated N-Reactor fuel. Currently, maintenance support activities are housed in existing structures that were constructed in the early 1950's. These forty-year-old facilities and their supporting services are substandard, leading to inefficiencies. Because of numerous identified deficiencies and the planned increase in the numbers of K-Basin maintenance personnel, adequate maintenance support facilities that allow efficient operations are needed. The objective of this sub-project of Project W-405 is to provide a maintenance and storage facility which meets the K-Basin Maintenance Organization requirements as defined in Attachment 1. In Reference A, existing guidelines and requirements were used to allocate space for the maintenance activities and to provide a layout concept (See Attachment 2). The design solution includes modifying the existing 190 K-E building to provide space for shops, storage, and administration support functions. The primary reason for the modification is to simplify siting/permitting and make use of existing infrastructure. In addition, benefits relative to design loads will be realized by having the structure inside 190K-E. The new facility will meet the Maintenance Organization approved requirements in Attachment 1 relating to maintenance activities, storage areas, and personnel support services. This sub-project will also resolve outstanding findings and/or deficiencies relating to building fire protection, HVAC requirements, lighting replacement/upgrades, and personnel facilities. Compliance with building codes, local labor agreements and safety standards will result.

9351 (WHC-SD-SNF-DA–004) **KE Basin monorail modification for the sludge removal and packaging project.** Orbeta, C.B. Westinghouse Hanford Co., Richland, WA (United States). 6 Feb 1995. 272p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract AC06-87RL10930. Order Number DE95007176. Source: OSTI; NTIS; INIS; GPO Dep.

The 105KE Basin currently stores over 1,100 metric tons of various N Reactor spent fuel in several canister forms, as well as several metric tons of sludge which must be removed. Modifications will consist of anchoring a permanent steel frame directly into the pit walls between existing columns and adding two travelling hoist rails, each capable of two directional motions. Each pit will have its own capability for targeting loads to any point inside the working areas of these pits. The structural frame designed for the monorail system at the Weasel and Tech-View pits was qualified as adequate for normal/operating loads, and dead plus live loads combined with seismic loads. The hoist operating live load is limited to 2,000 lb. The physical strength of the existing pit walls where the base plates are to be structurally anchored is unknown. The original structural drawings specified a minimum concrete strength of 3,000 lb/in^2. A pullout test should be performed to verify the strength of this concrete base. To reduce radiation exposure to levels as low as reasonably achievable (ALARA), installation and erection work inside the basin controlled area must be minimized; therefore, the pieces required for the modifications should be numbered in the fabrication shop, and erection should follow a procedure that corresponds to the assembly sequence indicated by the numbers. In conjunction with final erection, a mock-up activity should be conducted and base-plate locations verified to be within dimensional tolerances.

9352 (WHC-SD-SNF-FRD–007) **Functions and requirements for K Basin SNF characterization shipping.** Bergmann, D.W. Westinghouse Hanford Co., Richland, WA (United States). 10 Nov 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005632. Source: OSTI; NTIS; INIS; GPO Dep.

This document details the plan for the shipping of fuel samples from the K Basins to the 300 Area for characterization. The fuel characterization project will evaluate the Hanford defense production fuel (N-Reactor and Single Pass Reactor) to support interim storage, transportation and final disposition. A limited number of fuel samples will be transported to a laboratory for analysis. It is currently estimated that 20 shipments of fuel per year for approximately 3 years (could be as long as 5 years) will be transported to the laboratory for analysis. Based on the NRC certificate of compliance each shipment is limited to 500 equivalent grams of ^{235}U. In practical terms this will limit shipments to three outer elements or two assemblies of any type of N-Reactor or SPR fuel. Case by case determination of broken fuel will be made based on the type of fuel and maximum potential fissile content.

9353 (WHC-SD-SNF-HC–001) **K Basins fuel encapsulation and storage hazard categorization.** Porten, D.R. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005642. Source: OSTI; NTIS; INIS; GPO Dep.

This document establishes the initial hazard categorization for K-Basin fuel encapsulation and storage in the 100 K Area of the Hanford site. The Hazard Categorization for K-Basins addresses the potential for release of radioactive and non-radioactive hazardous material located in the K-Basins and their supporting facilities. The Hazard Categorization covers the hazards associated with normal K-Basin fuel storage and handling operations, fuel encapsulation, sludge encapsulation, and canister clean-up and disposal. The criteria categorizes a facility based on total curies per radionuclide located in the facility. Tables 5-3 and 5-4 display the results in section 5.0. In accordance with DOE-STD-1027 and the analysis provided in section 5.0, the K East Basin fuel encapsulation and storage activity and the K West Basin storage are classified as a "Category 2" Facility.

9354 (WHC-SD-SNF-HC–003) **Hazard categorization of 100 K West fuel canister gas and liquid sampling.** Alwardt, L.D. Westinghouse Hanford Co., Richland, WA (United States). 13 Dec 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005078. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the determination that the activities associated with the 100 K West fuel canister gas and liquid sampling are classified as Hazard Category Other (consequences are below criteria for Category 3).

9355 (WHC-SD-SNF-SARR–002-Rev.2) **Safety assessment of discharge chute isolation barrier preparation and installation.** Meichle, R.H. Westinghouse Hanford Co., Richland, WA (United States). 21 Oct 1994. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005633. Source: OSTI; NTIS; INIS; GPO Dep.

This analysis examines activities associated with the installation of isolation barriers in the K Basins at the Hanford Reservation. This revision adds evaluation of barrier drops on stored fuel and basin floor, identifies fuel which will be moved and addresses criticality issues with sludge. The safety assessment is made for the activities for the preparation and installation of the discharge chute isolation barriers. The safety assessment includes a hazard assessment and comparisons of potential accidents/events to those addressed by the current safety basis documentation. No significant hazards were identified. An evaluation against the USQ evaluation questions was made and the determination made that the activities do not represent a USQ. Hazard categorization techniques were used to provide a basis for readiness review classifications.

9356 (WHC-SD-SNF-SM–001) **Spent nuclear fuel sampling strategy.** Bergmann, D.W. Westinghouse Hanford Co., Richland, WA (United States). 8 Feb 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95007178. Source: OSTI; NTIS; INIS; GPO Dep.

This report proposes a strategy for sampling the spent nuclear fuel (SNF) stored in the 105-K Basins (105-K East and 105-K West). This strategy will support decisions concerning the path forward SNF disposition efforts in the following areas: (1) SNF isolation activities such as repackaging/overpacking to a newly constructed staging facility; (2) conditioning processes for fuel stabilization; and (3) interim storage options. This strategy was developed without following the Data Quality Objective (DQO) methodology. It is, however, intended to augment the SNF project DQOS. The SNF sampling is derived by evaluating the current storage condition of the SNF and the factors that effected SNF corrosion/degradation.

9357 (WHC-SD-SNF-TA–004) **OSR encapsulation basis – 100-KW.** Meichle, R.H. Westinghouse Hanford Co., Richland, WA (United States). 27 Jan 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006794. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to provide the basis for a change in the Operations Safety Requirement (OSR) encapsulated fuel storage requirements in the 105 KW fuel storage basin which will permit the handling and storing of encapsulated fuel in canisters which no longer have a water-free space in the top of the canister. The scope of this report is limited to providing the change from the perspective of the safety envelope (bases) of the Safety Analysis Report (SAR) and Operations Safety Requirements (OSR). It does not change the encapsulation process itself.

9358 (WHC-SD-SNF-TI–002) **Hanford Site existing irradiated fuel storage facilities description.** Willis, W.L. Westinghouse Hanford Co., Richland, WA (United States). 11 Jan 1995. 136p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005463. Source: OSTI; NTIS; GPO Dep.

This document describes facilities at the Hanford Site which are currently storing spent nuclear fuels. The descriptions provide a basis for the no-action alternatives of ongoing and planned National Environmental Protection Act reviews.

9359 (WHC-SD-SNF-TP–010) **Test plan for K-Basin fuel handling tools.** Bridges, A.E. Westinghouse Hanford Co., Richland, WA (United States). 8 Feb 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95007182. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to provide the test plan and procedures for the acceptance testing of the handling tools enveloped for the removal of an N-Reactor fuel element from its storage canister in the K-Basins storage pool and insertion into the Single fuel Element Can for subsequent shipment to a Hot Cell for examination. Examination of these N-Reactor fuel elements is part of the overall characterization effort. New hand tools were required since previous fuel movement has involved grasping the fuel in a horizontal position. The 305 Building Cold Test Facility will be used to conduct the acceptance testing of the Fuel Handling Tools. Upon completion of this acceptance testing and any subsequent training of operators, the tools will be transferred to the 105 KW Basin for installation and use.

9360 (WHC-SD-TP-RPT–017) **DOT-7A Type A packaging design guide.** Kelly, D.L. Westinghouse Hanford Co., Richland, WA (United States). 23 Jan 1995. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006707. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this Design Guide is to provide instruction for designing a U.S. Department of Transportation Specification 7A (DOT-7A) Type A packaging. Another purpose for this Design Guide is to support the evaluation and testing activities that are performed on new designs by a U.S. Department of Energy (DOE) test facility. This evaluation and testing program is called the DOT-7A Program. When an applicant has determined that a DOT-7A packaging is needed and not commercially available, a design may be created according to this document. The design should include a packaging drawing, specifications, analysis report, operating instructions, and a Packaging Qualification Checklist; all of which should be forwarded to a DOE/HQ approved test facility for evaluation and testing. This report is being submitted through the Engineering Documentation System so that it may be used for reference and information purposes.

9361 (WHC-SD-TP-RPT–018) **DOT-7A packaging test procedure.** Kelly, D.L. Westinghouse Hanford Co., Richland, WA (United States). 23 Jan 1995. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006706. Source: OSTI; NTIS; INIS; GPO Dep.

This test procedure documents the steps involved with performance testing of Department of Transportation Specification 7A (DOT-7A) Type A packages. It includes description of the performance tests, the personnel involved, appropriate safety considerations, and the procedures to be followed while performing the tests. Westinghouse Hanford Company (WHC) is conducting the evaluation and testing discussed herein for the Department of Energy-Headquarters, Division of Quality Verification and Transportation Safety (EH-321). Please note that this report is not in WHC format. This report is being submitted through the Engineering Documentation System so that it may be used for reference and information purposes.

9362 (WHC-SD-TP-SEP–028) **Safety Evaluation for Packaging for the N Reactor/single pass reactor fuel characterization shipments.** Stevens, P.F. Westinghouse Hanford Co., Richland, WA (United States). 13 Oct 1994. 143p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002119. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this Safety Evaluation for Packaging (SEP) is to authorize the ChemNuclear CNS 1-13G packaging to ship samples of irradiated fuel elements from the 100 K East and 100 K West basins to the Postirradiation Testing Laboratory (PTL) in support of the spent nuclear fuel characterization effort. It also authorizes the return of the fuel element samples to the 100 K East facility using the same packaging. The CNS 1-13G cask has been-chosen to transport the fuel because it has a Certificate of Compliance (CoC) issued by the US Nuclear Regulatory Commission (NRC) for transporting irradiated oxide and metal fuel in commerce. It is capable of being loaded and offloaded underwater and may be shipped with water in the payload compartment.

9363 (WHC-SD-W405-CR–001) **Design criteria document, Fire Protection Task, K Basin Essential Systems Recovery, Project W-405.** Johnson, B.H. Westinghouse Hanford Co., Richland, WA (United States). 14 Dec 1994. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005144. Source: OSTI; NTIS; INIS; GPO Dep.

The K Basin were constructed in the early 1950's with a 20 year design life. The K Basins are currently in their third design life and are serving as a near term storage facility for irradiated N Reactor fuel until an interim fuel storage solution can be implemented. In April 1994, Project W-405, K Basin Essential Systems Recovery, was established to address (among other things) the immediate fire protection needs of the 100K Area. A Fire Barrier Evaluation was performed for the wall between the active and inactive areas of the 105KE and 105KW buildings. This evaluation concludes that the wall is capable of being upgraded to provide an equivalent level of fire resistance as a qualified barrier having a fire resistance rating of 2 hours. The Fire Protection Task is one of four separate Tasks included within the scope of Project W405, K Basin Essential systems Recovery. The other three Tasks are the Water Distribution System Task, the Electrical System Task, and the Maintenance Shop/Support Facility Task. The purpose of Project W-405's Fire Protection Task is to correct Life Safety Code (NFPA 101) noncompliances and to provide fire protection features in Buildings 105KE, 105KW and 190KE that are essential for assuring the safe operation and storage of spent nuclear fuel at the 100K Area Facilities' Irradiated Fuel Storage Basins (K Basins).

9364 (WHC-SD-WM-ES–330) **PWR Core II blanket fuel disposition recommendation of storage option study.** Dana, C.M. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005071. Source: OSTI; NTIS; INIS; GPO Dep.

After review of the options available for current storage of T Plant Fuel the recommended option is wet storage without the use of chillers. A test has been completed that verifies the maximum temperature reached is below the industrial standard for storage of spent fuel. This option will be the least costly and still maintain the fuel in a safe environment. The options that were evaluated included dry storage with and without chillers, and wet storage with and without chillers. Due to the low decay heat of the Shippingport Core II Blanket fuel assemblies the fuel pool temperature will not exceed 100 deg. F.

9365 (WHC-SD-WM-WP–293) **T Plant removal of PWR Chiller Subsystem.** Dana, C.M. Westinghouse Hanford Co., Richland, WA (United States). 15 Dec 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005072. Source: OSTI; NTIS; INIS; GPO Dep.

The PWR Pool Chiller System is not longer required for support of the Shippingport Blanket Fuel Assemblies Storage. The Engineering Work Plan will provide the overall coordination of the documentation and physical changes to deactivate the unneeded subsystem. The physical removal of all energy sources for the Chiller equipment will be covered under a one time work plan. The documentation changes will be covered using approved Engineering Change Notices and Procedure Change Authorizations as needed.

9366 (DOE/EIA–0592) **Decommissioning of U.S. uranium production facilities.** USDOE Energy Information Administration, Washington, DC (United States). Feb 1995. 70p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95007387. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

From 1980 to 1993, the domestic production of uranium declined from almost 44 million pounds U_3O_8 to about 3 million pounds. This retrenchment of the U.S. uranium industry resulted in the permanent closing of many uranium-producing facilities. Current low uranium prices, excess world supply, and low expectations for future uranium demand indicate that it is unlikely existing plants will

be reopened. Because of this situation, these facilities eventually will have to be decommissioned. The Uranium Mill Tailings and Radiation Control Act of 1978 (UMTRCA) vests the U.S. Environmental Protection Agency (EPA) with overall responsibility for establishing environmental standards for decommissioning of uranium production facilities. UMTRCA also gave the U.S. Nuclear Regulatory Commission (NRC) the responsibility for licensing and regulating uranium production and related activities, including decommissioning. Because there are many issues associated with decommissioning-environmental, political, and financial-this report will concentrate on the answers to three questions: (1) What is required? (2) How is the process implemented? (3) What are the costs? Regulatory control is exercised principally through the NRC licensing process. Before receiving a license to construct and operate an uranium producing facility, the applicant is required to present a decommissioning plan to the NRC. Once the plan is approved, the licensee must post a surety to guarantee that funds will be available to execute the plan and reclaim the site. This report by the Energy Information Administration (EIA) represents the most comprehensive study on this topic by analyzing data on 33 (out of 43) uranium production facilities located in Colorado, Nebraska, New Mexico, South Dakota, Texas, Utah, and Washington.

9367 (AEA-D and R–0063) **Assessment of radioactive waste disposal in clay.** Mobbs, S. (National Radiological Protection Board, Chilton (United Kingdom)); Bonne, A.; Marivoet, J.; Dalrymple, G.J.; Laurens, J.M.; Winters, K.H. AEA Decommissioning and Radwaste, Harwell (United Kingdom). Sep 1990. 21p. (CONF-9009208–: 3. European community conference on radioactive waste management and disposal, Luxembourg (Luxembourg), 17-21 Sep 1990). Order Number DE95613247. Source: OSTI; NTIS (US Sales Only); INIS.

Two assessments of the potential radiological impact of disposal of medium-level and alpha-bearing wastes in clay formations have been carried out for the CEC PACOMA project. Both studies included uncertainty and sensitivity analyses. The results indicate that the radiological impact of disposal of these wastes in clay will be small, but a number of topics are identified for further study in order to confirm these results and produce more definitive estimates of the uncertainties associated with them. (author).

9368 (ANL–94/29) **Separation science and technology. Semiannual progress report, April 1992–September 1992.** Vandegrift, G.F. (and others); Betts, S.; Bowers, D.L. Argonne National Lab., IL (United States). Sep 1994. 107p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95005614. Source: OSTI; NTIS; INIS; GPO Dep.

This document reports on the work done by the Separations Science and Technology Programs of the Chemical Technology Division, Argonne National Laboratory, in the period April-September 1992. This effort is mainly concerned with developing the TRUEX process for removing and concentrating actinides from acidic waste streams contaminated with transuranic (TRU) elements. The objectives of TRUEX processing are to recover valuable TRU elements and to lower disposal costs for the nonTRU waste product of the process. Two other projects are underway with the objective of developing (1) a membrane-assisted solvent extraction method for treating natural and process waters contaminated by volatile organic compounds and (2) evaporation technology for concentrating radioactive waste and product streams such as those generated by the TRUEX process.

9369 (ANL–94/43) **Methods for removing transuranic elements from waste solutions.** Slater, S.A.; Chamberlain, D.B.; Connor, C.; Sedlet, J.; Srinivasan, B.; Vandegrift, G.F. Argonne National Lab., IL (United States). Nov 1994. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95007955. Source: OSTI; NTIS; INIS; GPO Dep.

This report outlines a treatment scheme for separating and concentrating the transuranic (TRU) elements present in aqueous waste solutions stored at Argonne National Laboratory (ANL). The treatment method selected is carrier precipitation. Potential carriers will be evaluated in future laboratory work, beginning with ferric hydroxide and magnetite. The process will result in a supernatant with alpha activity low enough that it can be treated in the existing evaporator/concentrator at ANL. The separated TRU waste will be packaged for shipment to the Waste Isolation Pilot Plant.

9370 (ANL/ET/CP–82489) **Chemically bonded phosphate ceramics for low-level mixed waste stabilization.** Singh, D. (Argonne National Lab., IL (United States)); Wagh, A.S.; Cunnane, J.C.; Mayberry, J.L. Argonne National Lab., IL (United States). [1994]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9409178–13: American Chemical Society meeting on industrial and engineering chemistry, Atlanta, GA (United States), 19-21 Sep 1994). Order Number DE95005840. Source: OSTI; NTIS; INIS; GPO Dep.

Novel chemically bonded phosphate ceramics (CBPCs) are being developed and fabricated for low-temperature stabilization and solidification of mixed waste streams which are amenable to conventional high-temperature stabilization processes due to presence of volatiles such as heavy metal chloride and fluorides and/or pyrophorics in the wastes. Phosphates of Mg, Mg-Na and Zr are being developed as candidate matrix materials. In this paper, we present the fabrication procedures of phosphate waste forms using surrogates compositions of three typical mixed wastes streams – ash, cement sludges, and salts. The performance of the final waste forms such as compression strength, leachability of the contaminants, durability in aqueous environment were conducted. In addition, parameteric studies have been conducted to establish the optimal waste loading in a particular binder system. Based on the results, we present potential applications in the treatment of various mixed waste streams.

9371 (ANL/ET/CP–83306) **Use of porous MgO in pyrochemical applications.** Maiya, P.S.; Sweeney, S.M.; Carroll, L.A.; Dusek, J.T. Argonne National Lab., IL (United States). Nov 1994. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941144–36: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95005857. Source: OSTI; NTIS; INIS; GPO Dep.

Pyrochemical methods for the extraction of transuranic elements from light water reactor spent fuel require a reduction step in which the oxide fuel is reduced to metals by Li in molten LiCl. The Li_2O formed is electrolytically reduced to metal in a cell that uses a carbon (or inert) anode and a Li cathode to recycle the salt and minimize the waste. Use of a carbon anode causes carbon dust that interferes with the process. Moreover, current efficiency is reduced as a result of oxidation of Li to Li_2O by CO_2. A porous MgO shroud around the anode was found to obviate these problems. Porous MgO crucibles and rectangular bar specimens were fabricated from MgO powders (electrically fused MgO, reagent grade MgO were mixed in appropriate combinations with a binder and lubricant). Particle size, force applied to the powders during cold pressing, and sintering temperature were varied to achieve a total porosity of >45% (mostly open porosity) and to control pore size and pore distribution. Mercury intrusion porosimetry was used to determine the pore size and pore size distribution. Flexural strength is observed to be proportional to the square root of pore size, which is consistent with fracture mechanics.

9372 (ANL/TD/CP–84382) **Spent fuel treatment at ANL-West.** Goff, K.M.; Benedict, R.W.; Levinskas, D. Argonne National Lab., Idaho Falls, ID (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-941207–26: Spent nuclear fuel meeting: challenges and initiatives, Salt Lake City, UT (United States), 14-16 Dec 1994). Order Number DE95005870. Source: OSTI; NTIS; INIS; GPO Dep.

At Argonne National Laboratory-West (ANL-West) there are several thousand kilograms of metallic spent nuclear fuel containing bond sodium. This fuel will be treated in the Fuel Cycle Facility at ANL-West to produce stable waste forms for storage and disposal. The treatment operations will employ a pyrochemical process that also has applications for treating most of the fuel types within the Department of Energy complex. The treatment equipment is in its last stage of readiness, and operations will begin in the Fall of 1994.

9373 (BARC–1994/E/012) **Removal of radioruthenium from alkaline intermediate level radioactive waste solution : a laboratory investigation.** Samanta, S.K. (Bhabha Atomic Rearch Centre, Bombay (India). Process Engineering and Systems Development Division); Theyyunni, T.K. Bhabha Atomic Research Centre, Bombay (India). 1994. 29p. Order Number DE95618975. Source: OSTI; NTIS (US Sales Only); INIS.

Various methods were investigated in the laboratory for the removal of radioruthenium from alkaline intermediate level radioactive waste solutions of reprocessing plant origin. The methods included batch equilibration with different ion exchangers and sorbents, column testing and chemical precipitation. A column method using zinc-activated carbon mixture and a chemical precipitation method using ferrous salt along with sodium sulphite were found to be promising for plant scale application. (author). 10 refs., 3 figs., 7 tabs.

9374 (BARC–1994/E/019) **Alkaline hydrolysis process for treatment and disposal of Purex solvent waste.** Srinivas, C. (Bhabha Atomic Research Centre, Bombay (India). Process Engineering and Systems Development Div.); Venkatesh, K.A.; Wattal, P.K.; Theyyunni, T.K.; Kartha, P.K.S.; Tripathi, S.C. Bhabha Atomic Research Centre, Bombay (India). 1994. 31p. Order Number DE95618976. Source: OSTI; NTIS (US Sales Only); INIS.

Treatment of spent Purex solvent (30% TBP-70% n-dodecane mixture) from reprocessing plants by alkaline hydrolysis process was investigated using inactive 30% TBP solvent as well as actual radioactive spent solvent. Complete conversion of TBP to water-soluble reaction products was achieved in 7 hours reaction time at 130 deg C using 50%(w/v) NaOH solution at NaOH to TBP mole ratio of 3:2. Addition of water to the product mixture resulted in the complete separation of diluent containing less than 2 and 8 Bq./ml. of α and β activity respectively. Silica gel and alumina were found effective for purification of the separated diluent. Aqueous phase containing most of the original radioactivity was found compatible with cement matrix for further conditioning and disposal. (author). 17 refs., 10 tabs., 1 fig.

9375 (BNL–60851) **Alternative way to dispose of high-level waste in outer space.** Takahashi, Hiroshi; Chen, Xinyi. Brookhaven National Lab., Upton, NY (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950110–4: 12. symposium on space nuclear power and propulsion, Albuquerque, NM (United States), 8-12 Jan 1995). Order Number DE95000815. Source: OSTI; NTIS; INIS; GPO Dep.

We propose a new approach to dispose of Long-Lived Fission Products (LLFPs) of type II such as ^{99}Tc and ^{129}I into outer solar space by providing an escape velocity from the solar system of 42 km/sec from a parking orbit or the moon's surface using a electrostatic accelerator and neutralizing the charged ions. LLFPs disposed uniformly in outer solar space pose no hazard as do LLFPs packages in Earth orbit, and have no effects on astronomical observations. This mode of disposition requires energy in the order of 1 keV for each nucleus, which is far smaller than the propulsion energy needed for launching a LLFPs package by rocket. Further, the power required of an accelerator ejecting most of the LLFPs generated by one LWR is 2.2 kW, which is much smaller than a medium-energy proton accelerator, a few tens of MW, which would be necessary to transmute these LLFPs using spallation neutrons created by protons.

9376 (CONF-9406226–) **[Modular risk analysis for assessing multiple waste sites]: Proceedings.** Whelan, G. Pacific Northwest Lab., Richland, WA (United States). [1994]. 495p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. From DOE integrated workshop from strategic planning to baseline and other objectives; Golden, CO (United States); 1-2 Jun 1994. Order Number DE95005084. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains proceedings from the Integrated Planning Workshop from Strategic Planning to Baselining and Other Objectives. Topics discussed include: stakeholder involvement; regulations; future site use planning; site integration and baseline methods; risk analysis in decision making; land uses; and economics in decision making. Individual records have been processed separately for the database.

9377 (CONF-9410250–) **1994 DOE Technical Standards Program Workshop: Proceedings.** Spellman, D.J. Oak Ridge National Lab., TN (United States). [1994]. 430p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1994 U.S. Department of Energy (DOE) technical standards program workshop; Reston, VA (United States); 3-5 Oct 1994. Order Number DE95004998. Source: OSTI; NTIS; INIS; GPO Dep.

The DOE Technical Standards Program has been structured to provide guidance and assistance for the development, adoption, and use of voluntary standards within the Department. OMB Circular A-119, "Federal Participation in the Development and Use of Voluntary Standards" establishes the policy to be followed in working with voluntary standards bodies, and in adopting and using voluntary standards whenever feasible. The DOE Technical Standards Program is consistent with this policy and is dedicated to the task of promoting its implementation. The theme of this year's workshop is "Standards Initiatives in Environmental Management fostering the development and use of industry standards for safe, environmentally responsible operations." The objective of the workshop is to increase the participant's awareness of the standardization activities taking place nationally and internationally and the impact of these activities on their efforts, and to facilitate the exchange of experiences, processes, and tools for implementing the program. Workshop sessions will include presentations by industry and Government notables in the environment, safety, and health arena with ample opportunity for everyone to ask questions and share experiences. There will be a breakout session which will concentrate on resolution of issues arising from the implementation of the DOE Technical Standards Program and a plenary session to discuss the plans developed by the breakout groups. Many organizations provide services and products which support the development, processing, distribution, and retrieval of standards. Those organizations listed at the end of the agenda will have exhibits available for your perusal throughout the workshop. Last year's workshop was very successful in stimulating an understanding of an interest in the standards program. This year, we hope to build on that success and provide an environment for the synergism of ideas to enhance the program and advance its implementation.

9378 (CONF-941207–18) **Direct conversion of spent fuel to High-Level-Waste (HLW) glass.** Forsberg, C.W.; Beahm, E.C.; Parker, G.W.; Rudolph, J. Oak Ridge National Lab., TN (United States). 20 Sep 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Spent nuclear fuel meeting: challenges and initiatives; Salt Lake City, UT (United States); 14-16 Dec 1994. Order Number DE95005981. Source: OSTI; NTIS; INIS; GPO Dep.

The Glass Material Oxidation and Dissolution System (GMODS) is a recently invented process for the direct, single-step conversion of spent nuclear fuel (SNF) to high-level waste (HLW) glass. GMODS converts metals, ceramics, organics, and amorphous solids to glass in a single step. Conventional vitrification technology can not accept feeds containing metals or carbon. The GMODS has the potential to solve several issues associated with the disposal of various US Department of Energy (DOE) miscellaneous SNFs: (1) chemical forms unacceptable for repository disposal; (2) high cost of qualifying small quantities of particular SNFs for disposal; (3) limitations imposed by high-enriched SNF in a repository because of criticality and safeguards issues; and (4) classified design information. Conversion of such SNFs to glass eliminates these concerns. A description of the GMODS, "strawman" product

criteria, experimental work to date, and product characteristics are included herein.

9379 (DOE/DP/48070–T1) **[Board on Radioactive Waste Managements action on progress toward objectives].** National Research Council, Washington, DC (United States). 28 Nov 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-89DP48070. Order Number DE95006395. Source: OSTI; NTIS; GPO Dep.

This report is a progress report to the US DOE from the Board on Radioactive Waste Management (BRWM), which summarizes the activities of the board during the period December 1, 1993 to May 2, 1994. The report summarizes the meetings of the board as a whole, of various of its subcommittees, and of activities it has undertaken to further its original mission. This board is associated with the National Research Council to give advice to US DOE.

9380 (DOE/EIS–0217D-Vol.1) **Draft Environmental Impact Statement, Waste Management, Savannah River Site, Aiken, South Carolina.** USDOE Savannah River Operations Office, Aiken, SC (United States). Jan 1995. 750p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006846. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this EIS is to assist DOE in deciding how to manage over the next 30 years liquid high-level radioactive, low-level radioactive, mixed, hazardous, and transuranic wastes generated during 40 years of past operations and on-going activities at the Savannah River Site (SRS) in southwestern South Carolina. The wastes are currently stored at SRS. DOE seeks to dispose of the wastes in a cost-effective manner that protects human health and the environment. In this document DOE assesses the cumulative environmental impacts of storing, treating, and disposing of the wastes, examines the impacts of alternatives, and identifies viable mitigation measures available to reduce adverse impacts. Evaluations of impacts on water quality, air quality, ecological systems, land use, geologic resources, cultural resources, socioeconomics, and the health and safety of onsite workers and the public are included in the assessment.

9381 (DOE/EIS–0217D-Vol.2) **Savannah River Site Waste Management Draft Environmental Impact Statement.** USDOE Savannah River Operations Office, Aiken, SC (United States). Jan 1995. 427p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006914. Source: OSTI; NTIS; INIS; GPO Dep.

This is Volume II of the Savannah River Site Waste Management Draft Environmental Impact statement. Included are the following appendixes: (A) Waste Forecasts; (B) Facility Descriptions; (C) Life-Cycle Treatment, Storage, and Disposal Facility Costs; (D) Innovative and Emerging Waste Management Treatment Technologies; (E) Supplemental Data; (F) Accident Analysis; (G) SRS Federal Facility Agreement Appendixes; (H) Alternative Approaches to Low-Level Waste Regulation.

9382 (DOE/LLW–114-Rev.1) **Greater-than-Class C low-level radioactive waste characterization: Estimated volumes, radionuclide activities, and other characteristics. Revision 1.** EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1994. 772p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE95004982. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy's (DOE's) planning for the disposal of greater-than-Class C low-level radioactive waste (GTCC LLW) requires characterization of the waste. This report estimates volumes, radionuclide activities, and waste forms of GTCC LLW to the year 2035. It groups the waste into four categories, representative of the type of generator or holder of the waste: Nuclear Utilities, Sealed Sources, DOE-Held, and Other Generator. GTCC LLW includes activated metals (activation hardware from reactor operation and decommissioning), process wastes (i.e., resins, filters, etc.), sealed sources, and other wastes routinely generated by users of radioactive material. Estimates reflect the possible effect that packaging and concentration averaging may have on the total volume of GTCC LLW. Possible GTCC mixed LLW is also addressed. Nuclear utilities will probably generate the largest future volume of GTCC LLW with 65–83% of the total volume. The other generators will generate 17–23% of the waste volume, while GTCC sealed sources are expected to contribute 1–12%. A legal review of DOE's obligations indicates that the current DOE-Held wastes described in this report will not require management as GTCC LLW because of the contractual circumstances under which they were accepted for storage. This report concludes that the volume of GTCC LLW should not pose a significant management problem from a scientific or technical standpoint. The projected volume is small enough to indicate that a dedicated GTCC LLW disposal facility may not be justified. Instead, co-disposal with other waste types is being considered as an option.

9383 (DOE/MC/29104–95/C0411) **Sensor-based interior modeling.** Herbert, M.; Hoffman, R.; Johnson, A.; Osborn, J. Carnegie-Mellon Univ., Pittsburgh, PA (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29104. (CONF-950232–16: 6. American Nuclear Society meeting on robotics and remote systems, Monterey, CA (United States), 5-10 Feb 1995). Order Number DE95007349. Source: OSTI; NTIS; INIS; GPO Dep.

Robots and remote systems will play crucial roles in future decontamination and decommissioning (D&D) of nuclear facilities. Many of these facilities, such as uranium enrichment plants, weapons assembly plants, research and production reactors, and fuel recycling facilities, are dormant; there is also an increasing number of commercial reactors whose useful lifetime is nearly over. To reduce worker exposure to radiation, occupational and other hazards associated with D&D tasks, robots will execute much of the work agenda. Traditional teleoperated systems rely on human understanding (based on information gathered by remote viewing cameras) of the work environment to safely control the remote equipment. However, removing the operator from the work site substantially reduces his efficiency and effectiveness. To approach the productivity of a human worker, tasks will be performed telerobotically, in which many aspects of task execution are delegated to robot controllers and other software. This paper describes a system that semi-automatically builds a virtual world for remote D&D operations by constructing 3-D models of a robot's work environment. Planar and quadric surface representations of objects typically found in nuclear facilities are generated from laser rangefinder data with a minimum of human interaction. The surface representations are then incorporated into a task space model that can be viewed and analyzed by the operator, accessed by motion planning and robot safeguarding algorithms, and ultimately used by the operator to instruct the robot at a level much higher than teleoperation.

9384 (DOE/METC–95/1014) **Proceedings of Opportunity '95 – Environmental technology through small business.** Kothari, V.P. (ed.). USDOE Morgantown Energy Technology Center, WV (United States). Nov 1994. 264p. Sponsored by USDOE, Washington, DC (United States). (CONF-9411149–: Opportunity 95: environmental technology through small business, Morgantown, WV (United States), 16-17 Nov 1994). Order Number DE95000040. Source: OSTI; NTIS; INIS; GPO Dep.

The Opportunity '95–Environmental Technology Through Small Business conference was held November 16–17, 1994, at the Morgantown Energy Technology Center (METC) in Morgantown, West Virginia. The overall objective of this conference was to review the latest environmental and waste management technologies being developed under the sponsorship of the Environmental Management–Office of Technology Development (EM-OTD) Program at METC. The focus of this conference was also to address the accomplishments and barriers affecting small businesses, and lay the groundwork for future technology development initiatives and opportunities. Twenty papers were presented in three EM-OTD focus areas: mixed waste characterization, treatment and disposal (6 papers); contaminant plume containment and remediation (6 papers); and facility transitioning, decommissioning and final disposition (8 papers). In addition to the presentations, nine posters of environmental management areas were displayed. A panel discussion was also held on technology development assistance to small businesses. Selected papers are indexed separately for inclusion in the Energy Science and Technology Database.

9385 (DOE/NTP–94-1040) **National transuranic program plan.** USDOE Carlsbad Area Office, NM (United States). 11 Oct

1994. 36p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005221. Source: OSTI; NTIS; INIS; GPO Dep.

As a result of various program initiatives, the U.S. generated and will continue to generate waste contaminated with radioactive materials. Because of increased awareness of the risks and special requirements to safely manage long-lived alpha-emitting radionuclides, a new category of radioactive waste, transuranic (TRU) waste, was adopted in 1970. Heads of Field Elements can determine that other alpha-contaminated wastes, peculiar to a specific site, must be managed as transuranic waste". TRU waste is generated and stored at various DOE sites around the country. In December 1993, the National Transuranic Program Office (NTPO) was established as part of the Carlsbad Area Office (CAO) to integrate and coordinate the diverse organizational elements that contribute to the complex-wide management of TRU waste. Numerous sites with small TRU waste inventories are also part of the national TRU waste system. The majority of TRU waste is also contaminated with hazardous materials and is thus considered mixed waste. Mixed waste must be managed in compliance with all federal, state, and local regulations that are applicable to the radioactive and/or hazardous component of the waste. Each generator site is responsible for the management of its respective waste. Sites must plan and implement programs to minimize, characterize, package, treat, store, ship, and dispose of all TRU waste; construct required waste management facilities and equipment; obtain permits; perform site-specific National Environmental Policy Act (NEPA) analyses; conduct environmental studies; perform laboratory analyses; and certify that waste meets appropriate disposal facility criteria. Due to the toxicity and long half-lives of TRU radionuclides, TRU waste must be disposed in a manner that offers greater confinement than shallow land burial.

9386 (DOE/NTP–94-1041) **National Transuranic Program Charter.** USDOE Carlsbad Area Office, NM (United States). Oct 1994. 9p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005222. Source: OSTI; NTIS; INIS; GPO Dep.

The National Transuranic Program Plan and Charter describes the functional elements of the National TRU Program, organizational relationships, programmatic responsibilities, division of work scope among the various DOE organizations that comprise the program, and program baselines against which overall progress will be measured. The charter defines the authorities and responsibilities of various organizations involved in the management of TRU waste throughout the DOE complex.

9387 (DOE/OR–2013) **Aqueous nitrate waste treatment: Technology comparison, cost/benefit, and market analysis.** Kapline Enterprises, Inc., Knoxville, TN (United States). Jan 1994. 260p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95008871. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this analysis is to provide information necessary for the Department of Energy (DOE) to evaluate the practical utility of the Nitrate to Ammonia and Ceramic or Glass (NAC/NAG/NAX) process, which is under development in the Oak Ridge National Laboratory. The NAC/NACx/NAX process can convert aqueous radioactive nitrate-laden waste to a glass, ceramic, or grout solid waste form. The tasks include, but are not limited to, the following: Identify current commercial technologies to meet hazardous and radiological waste disposal requirements. The technologies may be thermal or non-thermal but must be all inclusive (i.e., must convert a radionuclide-containing nitrate waste with a pH around 12 to a stable form that can be disposed at permitted facilities); evaluate and compare DOE-sponsored vitrification, grouting, and minimum additive waste stabilization projects for life-cycle costs; compare the technologies above with respect to material costs, capital equipment costs, operating costs, and operating efficiencies. For the NAC/NAG/NAX process, assume aluminum reactant is government furnished and ammonia gas may be marketed; compare the identified technologies with respect to frequency of use within DOE for environmental management applications with appropriate rationale for use; Assess the potential size of the DOE market for the NAC/NAG/NAX process; assess and off-gas issues; and compare with international technologies, including life-cycle estimates.

9388 (DOE/RL–92-39-Rev.1) **Hanford Patrol Academy demolition sites closure plan.** Westinghouse Hanford Co., Richland, WA (United States). 30 Sep 1993. 335p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006632. Source: OSTI; NTIS; GPO Dep.

The Hanford Site is owned by the U.S. Government and operated by the U.S. Department of Energy, Richland Operations Office. Westinghouse Hanford Company is a major contractor to the U.S. Department of Energy, Richland Operations Office and serves as co-operator of the Hanford Patrol Academy Demolition Sites, the unit addressed in this paper. This document consists of a Hanford Facility Dangerous Waste Part A Permit Application, Form 3 (Revision 4), and a closure plan for the site. An explanation of the Part A Form 3 submitted with this closure plan is provided at the beginning of the Part A section. This Hanford Patrol Academy Demolition Sites Closure Plan submittal contains information current as of December 15, 1994.

9389 (DOE/RW/00134–T15-Vol.1-Rev.1) **FY 93 thermal loading systems study final report: Volume 1. Revision 1.** Saterlie, S.F.; Thomson, B.H. TRW Environmental Safety Systems, Inc., Las Vegas, NV (United States). 29 Aug 1994. 188p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-91RW00134. Order Number DE95006912. Source: OSTI; NTIS; INIS; GPO Dep.

The ability to meet the overall performance requirements for the proposed Mined Geology Disposal System at Yucca Mountain, Nevada requires the two major subsystem (natural barriers and engineered barriers) to positively contribute to containment and radionuclide isolation. In addition to the postclosure performance the proposed repository must meet preclosure requirements of safety, retrievability, and operability. Cost and schedule were also considered. The thermal loading strategy chosen may significantly affect both the postclosure and preclosure performance of the proposed repository. Although the current Site Characterization Plan reference case is 57 kilowatts (kW)/acre, other thermal loading strategies (different areal mass loadings) have been proposed which possess both advantages and disadvantages. The objectives of the FY 1993 Thermal Loading Study were to (1) place bounds on the thermal loading which would establish the loading regime that is "too hot" and the loading regime that is "too cold", to (2) "grade" or evaluate the performance, as a function of thermal loading, of the repository to contain high level wastes against performance criteria and to (3) evaluate the performance of the various options with respect to cost, safety, and operability. Additionally, the effort was to (4) identify important uncertainties that need to be resolved by tests and/or analyses in order to complete a performance assessment on the effects of thermal loading. The FY 1993 Thermal Loading Study was conducted from December 1, 1992 to December 30, 1993 and this final report provides the findings of the study. Volume 1 contains the Introduction; Performance requirements; Input and assumptions; Near-field thermal analysis; Far-field thermal analysis; Cost analysis; Other considerations; System analysis; Additional thermal analysis; and Conclusions and recommendations. 71 refs., 54 figs.

9390 (DOE/RW/00134–T15-Vol.2-Rev.1) **FY 93 thermal loading systems study final report: Volume 2. Revision 1.** TRW Environmental Safety Systems, Inc., Las Vegas, NV (United States). 29 Aug 1994. 256p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-91RW00134. Order Number DE95006913. Source: OSTI; NTIS; INIS; GPO Dep.

The ability to meet the overall performance requirements for the proposed Mined Geology Disposal System at Yucca Mountain, Nevada requires the two major subsystem (natural barriers and engineered barriers) to positively contribute to containment and radionuclide isolation. In addition to the postclosure performance the proposed repository must meet preclosure requirements of safety, retrievability, and operability. Cost and schedule were also considered. The thermal loading strategy chosen may significantly affect both the postclosure and preclosure performance of the proposed repository. Although the current Site Characterization Plan reference case is 57 kilowatts (kW)/acre, other thermal loading strategies (different areal mass loadings) have been proposed which possess both advantages and disadvantages. The objectives of the FY 1993 Thermal Loading Study were to (1) place bounds on the thermal loading which would establish the loading regime

that is "too hot" and the loading regime that is "too cold", to (2) "grade" or evaluate the performance, as a function of thermal loading, of the repository to contain high level wastes against performance criteria and to (3) evaluate the performance of the various options with respect to cost, safety, and operability. Additionally, the effort was to (4) identify important uncertainties that need to be resolved by tests and/or analyses in order to complete a performance assessment on the effects of thermal loading. The FY 1993 Thermal Loading Study was conducted from December 1, 1992 to December 30, 1993 and this final report provides the findings of the study. Volume 2 consists of 10 appendices which contain the following: Waste Stream Analysis; Waste Package Design Inputs; Subsurface Design Inputs; Thermal-Hydrologic Model Inputs; Near-Field Calculations; Far-Field; Reliability of Electronics as a Function of Temperature; Cost Analysis Details; Geochemistry; and Areas of Uncertainty in Thermal Loading.

9391 (DOE/WIPP–94-2029) **No-migration determination. Annual report, September 1, 1993–August 31, 1994.** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. Nov 1994. 82p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE95005488. Source: OSTI; NTIS; INIS; GPO Dep.

This report fulfills the annual reporting requirement as specified in the Conditional No-Migration Determination (NMD) for the U.S. Department of Energy (DOE) Waste Isolation Pilot Plant (WIPP), published in the Federal Register on November 14, 1990 (EPA, 1990a). This report covers the project activities, programs, and data obtained during the period September 1, 1993, through August 31, 1994, to support compliance with the NMD'. In the NMD, the U.S. Environmental Protection Agency (EPA) concluded that the DOE had demonstrated, to a reasonable degree of certainty, that hazardous constituents will not migrate from the WIPP disposal unit during the test phase of the project, and that the DOE had otherwise met the requirements of 40 CFR Part 268.6, Petitions to Allow Land Disposal of a Waste Prohibited Under Subpart C of Part 268 (EPA, 1986a), for the WIPP facility. By granting the NMD, the EPA has allowed the DOE to temporarily manage defense-generated transuranic (TRU) mixed wastes, some of which are prohibited from land disposal by Title 40 CFR Part 268, Land Disposal Restrictions (EPA, 1986a), at the WIPP facility for the purposes of testing and experimentation for a period not to exceed 10 years. In granting the NMD, the EPA imposed several conditions on the management of the experimental waste used during the WIPP test phase. One of these conditions is that the DOE submit annual reports to the EPA to demonstrate the WIPP's compliance with the requirements of the NMD. In the proposed No-Migration Variance (EPA, 1990b) and the final NMD, the EPA defined the content and parameters that must be reported on an annual basis. These reporting requirements are summarized and are cross-referenced with the sections of the report that satisfy the respective requirement.

9392 (DOE/WIPP–94-2031) **FY95 capital asset implementation plan.** Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. Dec 1994. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE95007122. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Isolation Division (WID) is committed to providing good stewardship for the capital assets under its operational and physical control. To achieve this goal, the WID has developed the Capital Asset Implementation Plan (CAIP) to continue to implement for FY95 Department of Energy (DOE) Order 4320.2A, Capital Asset Management Process (CAMP). The Order provides policy and elements needed to establish a credible, consistent, auditable, and technically sound process for the DOE to forecast, plan, and budget for capital assets on a functional unit level. The objective of the WIPP CAMP program is to meet the goals of DOE Order 4320.2A in the most effective and efficient manner possible in support of the Waste Isolation Pilot Plant (WIPP) mission. As a result, this CAIP provides a way to implement the CAMP Program using a graded approach. Continued implementation will be accomplished by improving the existing process, and establishing future goals to promote growth for the CAMP Program. The CAIP is issued annually by the WID with quarterly progress reports submitted to the DOE. This document describes the current-year program staffing, roles, responsibilities, funding, and near-term milestones. In addition, the results of past goals are discussed.

9393 (EGG-M–94023) **T-Rex system for operation in TRU, LLW, and hazardous zones.** Kline, H.M. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Andreycheck, T.P.; Beeson, B.K. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-940225–128: Waste management '94, Tucson, AZ (United States), 27 Feb - 3 mar 1994). Order Number DE95005035. Source: OSTI; NTIS; INIS; GPO Dep.

T-Rex stands for Transuranic Storage Area Remote Excavator that is dedicated to the retrieval of above ground waste containers and overburden at the Radioactive Waste Management Complex (RWMC) located at the Idaho National Engineering Laboratory. There are a number of sites around the world containing (transuranic) (TRU), low level (LLW), and hazardous wastes that requires teleoperated, heavy lift manipulators with long reach and high precision to handle the materials stored there. Remote operation of equipment will reduce the risk to personnel to as-low-as-reasonably-achievable (ALARA) levels. The T-Rex is designed to fulfill this requirement at relatively low cost through the integration of a production front shovel excavator with a control system, local and remote operator control stations, a closed-circuit television system (CCTV), and multiple end effectors with quick changeout capability. This paper describes the conversion of an off-the-shelf excavator to a machine utilizing a modified hydraulic system, an integrated onboard remote control system, CCTV system, collision avoidance system, and a remote control station.

9394 (EGG-M–94040) **A sensitivity study of an evaluation of alternatives for disposal of INEL low-level waste and low-level mixed waste.** Roesener, W.S.; Smith, T.H.; Jorgenson-Waters, M.J.; Sherick, M.J. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-940225–127: Waste management '94, Tucson, AZ (United States), 27 Feb - 3 mar 1994). Order Number DE95005020. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents insights gained from an informal sensitivity study of an evaluation of disposal alternatives for Idaho National Engineering Laboratory low-level waste and low-level mixed waste. The insights relate to the sensitivity of the alternative rankings to changes in assumptions identified as "key uncertainties". The result of the sensitivity study is that significant changes occur in the rankings when selected "key uncertainties" are varied over reasonable ranges. Three alternatives involving the use of (a) shallow land burial and boreholes or (b) greater-depth burial and boreholes rank high for all cases investigated. The other alternatives rank low in some or all cases.

9395 (EGG-M–94071) **Applications for electronic documents.** Beitel, G.A. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9406297–1: 1994 annual meeting of the American Nuclear Society (ANS), Stanford, CA (United States), 19-23 Jun 1994). Order Number DE95005036. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discusses the application of electronic media to documents, specifically Safety Analysis Reports (SARs), prepared for Environmental Restoration and Waste Management (ER&WM) programs being conducted for the Department of Energy (DOE) at the Idaho National Engineering Laboratory (INEL). Efforts are underway to upgrade our document system using electronic format. To satisfy external requirements (DOE, State, and Federal), ER&WM programs generate a complement of internal requirements documents including a SAR and Technical Safety Requirements along with procedures and training materials. Of interest, is the volume of information and the difficulty in handling it. A recently prepared ER&WM SAR consists of 1,000 pages of text and graphics; supporting references add 10,000 pages. Other programmatic requirements documents consist of an estimated 5,000 pages plus references.

9396 (EGG-M–94073) **Method of characterizing void volume headspace in vented transuranic waste sludge drums using limited sampling data.** Liekhus, K.J. (EG&G Idaho, Inc., Idaho Falls, ID (United States)); Connolly, M.J.; Arnold, P.M.; O'Leary, G.A. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-940815–106: International nuclear and hazardous waste management conference, Atlanta, GA (United States), 14-18 Aug 1994). Order Number DE95005025. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy must demonstrate to the Environmental Protection Agency that a drum headspace sample is representative of the volatile organic compounds (VOCs) within the entire void space of the waste container in order to demonstrate compliance in the future when drums could be directly emplaced in the Waste Isolation Pilot Plant in New Mexico. A test program is underway at the Idaho National Engineering Laboratory to determine if the drum headspace VOC concentration is representative of the concentration in the entire drum void space and demonstrate that the VOC concentration in the void space of each layer of confinement can be estimated using a model incorporating diffusive and permeative transport principles and limited waste drum sampling data. A comparison of model predictions of VOC concentration in the innermost layer of confinement with actual measurement from transuranic waste sludge drums demonstrate that the model may be useful in characterizing VOC concentration throughout entire drum void volume.

9397 (EGG-M–94179) **Developments in radiography and tomography of waste containers at the Idaho National Engineering Laboratory.** Roney, T.J.; Allemeier, R.T.; Galbraith, S.G.; Tow, D.M. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-940815–108: International nuclear and hazardous waste management conference, Atlanta, GA (United States), 14-18 Aug 1994). Order Number DE95005037. Source: OSTI; NTIS; INIS; GPO Dep.

The Idaho National Engineering Laboratory (IN-F-L) has been inspecting containers (boxes and drums) of nuclear waste materials using real-time radiography (RTR) for the past ten years. Requirements governing characterization of containerized waste for short-term storage, treatment, transportation, and disposal have become more stringent. These new requirements, and the need to reduce inspection times to increase throughput, necessitate improvements in the information obtained by radiographic methods. RTR provides a qualitative view of container contents, whereas quantitative information is often required. Two projects at the INEL are converting the present qualitative radiographic inspection to the more quantitative digital radiography (DR) and computed tomography (CT) methods, while retaining the RTR function. The first project is modifying, the RTR hardware at the Radioactive Waste Management Complex (RWMC) to allow rapid processing of analog RTR images. The digital RTR (DRTR) system described here can digitize, process, and redisplay RTR images at video frame rates allowing for real-time image improvement features such as edge detection, contrast enhancement, frame subtraction, frame averaging, and a variety of digital filtering options. The second project is developing a complete radiographic and tomographic capability that allows for greater sophistication in data acquisition and processing as the operator and/or requirements demand. The approach involves modification of an industrial CT scanner with the capability to acquire radiographic and tomographic data in several modes, including conventional RTR, DR, and CT with a linear detector for high spatial resolution, and DR and CT with an area detector for high throughput. Improvements in image quality and quantitative digital radiographic capabilities of the DRTR system are shown. Status and plans for the modified CT scanner (presently under development) are also presented.

9398 (EGG-M–94180) **Controlling changes - lessons learned from waste management facilities.** Johnson, B.M.; Koplow, A.S.; Stoll, F.E.; Waetje, W.D. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9405138–3: 1994 Department of Energy configuration management workshop, Las Vegas, NV (United States), 3 May 1994). Order Number DE95005040. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discusses lessons learned about change control at the Waste Reduction Operations Complex (WROC) and Waste Experimental Reduction Facility (WERF) of the Idaho National Engineering Laboratory (INEL). WROC and WERF have developed and implemented change control and an as-built drawing process and have identified structures, systems, and components (SSCS) for configuration management. The operations have also formed an Independent Review Committee to minimize costs and resources associated with changing documents. WROC and WERF perform waste management activities at the INEL. WROC activities include storage, treatment, and disposal of hazardous and mixed waste. WERF provides volume reduction of solid low-level waste through compaction, incineration, and sizing operations. WROC and WERF's efforts aim to improve change control processes that have worked inefficiently in the past.

9399 (EGG-M–94219) **Integrated approach to hazardous and radioactive waste remediation.** Hyde, R.A.; Reece, W.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-950232–9: 6. American Nuclear Society meeting on robotics and remote systems, Monterey, CA (United States), 5-10 Feb 1995). Order Number DE95002046. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy Office of Technology Development is supporting the demonstration, and evaluation of a suite of waste retrieval technologies. An integration of leading-edge technologies with commercially available baseline technologies will form a comprehensive system for effective and efficient remediation of buried waste throughout the complex of DOE nuclear facilities. This paper discusses the complexity of systems integration, addressing organizational and engineering aspects of integration as well as the impact of human operators, and the importance of using integrated systems in remediating buried hazardous and radioactive waste.

9400 (EGG-M–94234) **Buried Waste Integrated Demonstration lessons learned: 1993 technology demonstrations.** Kostelnik, K.M.; Owens, K.J. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-940815–107: International nuclear and hazardous waste management conference, Atlanta, GA (United States), 14-18 Aug 1994). Order Number DE95005018. Source: OSTI; NTIS; INIS; GPO Dep.

An integrated technology demonstration was conducted by the Buried Waste Integrated Demonstration (BWID) at the Idaho National Engineering Laboratory Cold Test Pit in the summer of 1993. This program and demonstration was sponsored by the US Department of Energy Office of Technology Development. The demonstration included six technologies representing a synergistic system for the characterization and retrieval of a buried hazardous waste site. The integrated technology demonstration proved very successful and a summary of the technical accomplishments is presented. Upon completion of the integrated technology demonstration, cognizant program personnel participated in a lessons learned exercise. This exercise was conducted at the Simplot Decision Support Center at Idaho State University and lessons learned activity captured additional information relative to the integration of technologies for demonstration purposes. This information will be used by BWID to enhance program planning and strengthen future technology demonstrations.

9401 (EGG-M–94275) **Cost and quality effectiveness of objective-based and statistically-based quality control for volatile organic compounds analyses of gases.** Bennett, J.T.; Crowder, C.A.; Connolly, M.J. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1994]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-940790–5: 10. annual waste testing and quality assurance symposium, Arlington, VA (United States), 11-15 Jul 1994). Order Number DE95005026. Source: OSTI; NTIS; INIS; GPO Dep.

Gas samples from drums of radioactive waste at the Department of Energy (DOE) Idaho National Engineering Laboratory are being characterized for 29 volatile organic compounds to determine the

feasibility of storing the waste in DOE's Waste Isolation Pilot Plant (WIPP) in Carlsbad, New Mexico. Quality requirements for the gas chromatography (GC) and GC/mass spectrometry chemical methods used to analyze the waste are specified in the Quality Assurance Program Plan for the WIPP Experimental Waste Characterization Program. Quality requirements consist of both objective criteria (data quality objectives, DQOs) and statistical criteria (process control). The DQOs apply to routine sample analyses, while the statistical criteria serve to determine and monitor precision and accuracy (P&A) of the analysis methods and are also used to assign upper confidence limits to measurement results close to action levels. After over two years and more than 1000 sample analyses there are two general conclusions concerning the two approaches to quality control: (1) Objective criteria (e.g., ± 25% precision, ± 30% accuracy) based on customer needs and the usually prescribed criteria for similar EPA- approved methods are consistently attained during routine analyses. (2) Statistical criteria based on short term method performance are almost an order of magnitude more stringent than objective criteria and are difficult to satisfy following the same routine laboratory procedures which satisfy the objective criteria. A more cost effective and representative approach to establishing statistical method performances criteria would be either to utilize a moving average of P&A from control samples over a several month time period or to determine within a sample variation by one-way analysis of variance of several months replicate sample analysis results or both. Confidence intervals for results near action levels could also be determined by replicate analysis of the sample in question.

9402 (EGG-M–94401) **Viscosity-based high temperature waste form compositions.** Reimann, G.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1994]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9409178–14: American Chemical Society meeting on industrial and engineering chemistry, Atlanta, GA (United States), 19-21 Sep 1994). Order Number DE95005038. Source: OSTI; NTIS; INIS; GPO Dep.

High-temperature waste forms such as iron-enriched basalt are proposed to immobilize and stabilize a variety of low-level wastes stored at the Idaho National Engineering Laboratory. The combination of waste and soil anticipated for the waste form results in high SiO_2 + Al_2O_3 producing a viscous melt in an arc furnace. Adding a flux such as CaO to adjust the basicity ratio (the molar ratio of basic to acid oxides) enables tapping the furnace without resorting to extreme temperatures, but adds to the waste volume. Improved characterization of wastes will permit adjusting the basicity ratio to between 0.7 and 1.0 by blending of wastes and/or changing the waste-soil ratio. This minimizes waste form volume. Also, lower pouring temperatures will decrease electrode and refractory attrition, reduce vaporization from the melt, and, with suitable flux, facilitate crystallization. Results of laboratory tests were favorable and pilot-scale melts are planned; however, samples have not yet been subjected to leach testing.

9403 (EGG-PIR–10633(1Q-94)) **Performance indicators for first quarter CY 1994.** EG and G Idaho, Inc., Idaho Falls, ID (United States). [1994]. 121p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE95002300. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) has established a Department-Wide Performance Indicator (PI) Program for trending and analysis of operational data as directed by DOE Order 5480.26. The PI Program was established to provide a means for monitoring the environment safety, and health (ES&H) performance of the DOE at the Secretary and other management levels. This is the thirteenth in a series of quarterly reports generated for the Department of Energy Idaho Operations Office (DOE-ID) by EG&G Idaho, Inc., to meet the requirements of the PI Program as directed by the DOE Standard (DOE-STD-1048-92). The report format and content adhere to the guidelines established In DOE Order 5480.26, Trending and Analysis of Operations Information Using Performance Indicators, and DOE-STD-1048-92, DOE Peformance Indicators Guidance Document.

9404 (EGG-WTD–11446) **Buried waste integrated demonstration human engineered control station. Final report.** Idaho National Engineering Lab., Idaho Falls, ID (United States). Sep 1994. 286p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE95004997. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the Human Engineered Control Station (HECS) project activities including the conceptual designs. The purpose of the HECS is to enhance the effectiveness and efficiency of remote retrieval by providing an integrated remote control station. The HECS integrates human capabilities, limitations, and expectations into the design to reduce the potential for human error, provides an easy system to learn and operate, provides an increased productivity, and reduces the ultimate investment in training. The overall HECS consists of the technology interface stations, supporting engineering aids, platform (trailer), communications network (broadband system), and collision avoidance system.

9405 (ENRESA–01/93) **Investigation of bentonites as sealing materials for high level radioactive wastes storage.** Linares, J. (V.E.I. Fisicoquimica y Geoquimica mineral del Zaidin, Granada (Spain)). No corporate text available. 1993. 324p. (In Spanish). Order Number DE95745028. Source: OSTI; NTIS; INIS.

This report analyzes the bentonites in Almeria in order to select the selling materials for the high level radioactive waste storage. It is studied the geologic properties of Gata Cape, Almeria (Spain) area.

9406 (ENRESA–09/94) **Preliminary experiences of radionuclide migration with granitic materials: El Berrocal (Spain).** Garcia Gutierrez, M. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). 1994. 110p. (In Spanish). Order Number DE95745009. Source: OSTI; NTIS; INIS.

This report presents the radionuclide migration in granitic rocks used for radioactive waste storage. This project is developed in El Berrocal (Spain). The author studies the absorption process, applies the transport equation, the column migration and analyzes the curves.

9407 (EPA–402-K-93-002) **Office of radiation and indoor air: Program description.** Environmental Protection Agency, Washington, DC (United States). Jun 1993. 28p. Sponsored by Environmental Protection Agency, Washington, DC (United States). Source: OSTI; INIS.

The goal of the Environmental Protection Agency's (EPA) Office of Radiation and Indoor Air is to protect the public and the environment from exposures to radiation and indoor air pollutants. The Office develops protection criteria, standards, and policies and works with other programs within EPA and other agencies to control radiation and indoor air pollution exposures; provides technical assistance to states through EPA's regional offices and other agencies having radiation and indoor air protection programs; directs an environmental radiation monitoring program; responds to radiological emergencies; and evaluates and assesses the overall risk and impact of radiation and indoor air pollution. The Office is EPA's lead office for intra- and interagency activities coordinated through the Committee for Indoor Air Quality. It coordinates with and assists the Office of Enforcement in enforcement activities where EPA has jurisdiction. The Office disseminates information and works with state and local governments, industry and professional groups, and citizens to promote actions to reduce exposures to harmful levels of radiation and indoor air pollutants.

9408 (EPA–530-B-92-003) **Compendium of ORD and OSWER documents relevant to RCRA corrective action.** Environmental Protection Agency, Washington, DC (United States). Office of Solid Waste. Apr 1992. 103p. Sponsored by Environmental Protection Agency, Washington, DC (United States). Order Number DE95005354. Source: OSTI; NTIS; INIS.

Throughout the past decade, several offices within the US Environmental Protection Agency (EPA) have been involved in hazardous waste management technologies research, remedial action at chemically contaminated sites, and regulatory development for permitting hazardous waste management facilities. The primary offices involved in these activities include the Office of Research and Development (ORD) and the Office of Solid Waste and Emergency Response (OSWER). During this period, substantial knowledge

and experience have been gained relevant to the a placability of remedial action technologies in various environmental setting.

9409 (EPA–540-R-92-021) **Guidance for performing site inspections under CERCLA.** Environmental Protection Agency, Washington, DC (United States). Hazardous Site Evaluation Div. Sep 1992. 240p. Sponsored by Environmental Protection Agency, Washington, DC (United States). (PB–92-963375). Source: OSTI.

This guidance presents EPA's site inspection (SI) strategy. The strategy discusses procedural guidelines to investigate potential Superfund (CERCLA) sites for evaluation pursuant to the Hazard Ranking System (HRS), revised in accordance with the Superfund Amendments and Reauthorization Act of 1986. The HRS is the primary means by which EPA evaluates sites for superfund's National Priorities List (NPL).

9410 (ES/ER/TM–131) **Radiological criteria for remedial actions at radioactively contaminated sites. Environmental Restoration Program.** Kocher, D.C. Oak Ridge National Lab., TN (United States). Sep 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95002304. Source: OSTI; NTIS; GPO Dep.

Radiological criteria for determining acceptable remedical actions at radioactively contaminated sites on the Oak Ridge Reservation are presented in this report. The proposed criteria address protection of human health and man's exposure environment but do not address protection of nonhuman biota. In addition, the criteria do not address potential exposures to nonradioactive hazardous chemicals that might be present at contaminated sites; however, as discussed, the protection principles on which the proposed radiological criteria are based could be used to determine acceptable remedial actions for carcinogenic hazardous chemicals. An important rationale for the proposed remedial action criteria is that many of the contaminated sites of concern were used for deliberate disposals of radioactive waste, principally low-level waste, or the sites contain radioactive materials similar in composition and potential hazard to many low-level wastes. Indeed, the basis for this proposal is the notion that remedial actions at radioactively contaminated sites on the Oak Ridge Reservation should achieve risks to human health consistent with current standards for ongoing, permitted disposals of low-level radioactive waste at Oak Ridge and all other United States Department of Energy (DOE) sites.

9411 (ESH-EMS–940515) **The Savannah River Site's Groundwater Monitoring Program. Second quarter 1994.** Westinghouse Savannah River Co., Aiken, SC (United States); Exploration Resources, Inc., Athens, GA (United States). Nov 1994. 783p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95005970. Source: OSTI; NTIS; GPO Dep.

This document contains information concerning the groundwater monitoring program at Savannah River Plant. The EPD/EMS (environmental protection department/environmental monitoring section) is responsible for monitoring constituents in the groundwater at approximately 135 waste sites in 16 areas at SRS. This report consolidates information from field reports, laboratory analysis, and quality control. The groundwater in these areas has been contaminated with radioactive materials, organic compounds, and heavy metals.

9412 (ETDE-IT–95-08) **Tridimensional analysis of Los Alamos accelerator driven transportation system.** Landeyro, P.A. (ENEA, Casaccia (Italy). Area Energia e Innovazione); Orazi, A.; Santilli, A. ENEA, Rome (Italy). 1994. 7p. (CONF-940109–4: International conference on reactor physics and reactor computations, Tel Aviv (Israel), 23-26 Jan 1994). Order Number DE95749702. Source: OSTI; NTIS (US Sales Only).

The present work describes the activity performed in the framework of the validation of both calculation tools and nuclear data to use for the simulation of the Los Alamos Actinide Transmutation of Waste Project (ATW). The calculations have been shown a reasonable agreement with avaliable reference data which assure the adequacy of the selected code chain and associated cross section file in simulating the main phenomena of the transmutation process. On the other hand, such validation results have highlighted some code inaccuracy and cross section data unrealistic behaviour which need of further investigations and updating activities.

9413 (FEMP–2361) **Radiological release criteria at the Fernald Environmental Management Project theory and practice.** Lehrter, R.W. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). 17 Jan 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950216–31: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95006174. Source: OSTI; NTIS; INIS; GPO Dep.

As environmental restoration activities progress at the DOE's Fernald site, and across the country, large volumes of radioactive scrap metal (RSM) are being generated. Despite the existence of "free-release" guidelines from DOE. The strategy of onsite decontamination and release of RSM for unrestricted use has been generally overlooked in recent years. A pilot project was completed at Fernald in which 120 tons of RSM were decontaminated onsite and released for unrestricted use. This paper compares that strategy to more traditional DOE RSM management practices. Many options exist for managing RSM. DOE orders dictate that contractors demonstrate flexibility in utilizing a combination of techniques to optimize the benefits of waste management activates. The FERMCO Recycling Department led an effort to provide their customer with an economical alternative to the traditional approach of burying contaminated metal as LLW, based on established DOE free-release guidelines.

9414 (FEMP–2381) **Fernald waste management and disposition.** West, M.L. (Fernald Environmental Management Project, Cincinnati, OH (United States)); Fisher, L.A.; Frost, M.L.; Rast, D.M. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. 30 Jan 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950216–28: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95006758. Source: OSTI; NTIS; INIS; GPO Dep.

Historically waste management within the Department of Energy complex has evolved around the operating principle of packaging waste generated and storing until a later date. In many cases wastes were delivered to onsite waste management organizations with little or no traceability to origin of generation. Sites then stored their waste for later disposition offsite or onsite burial. While the wastes were stored, sites incurred additional labor costs for maintaining, inspecting and repackaging containers and capital costs for storage warehouses. Increased costs, combined with the inherent safety hazards associated with storage of hazardous material make these practices less attractive. This paper will describe the methods used at the Department of Energy's Fernald site by the Waste Programs Management Division to integrate with other site divisions to plan in situ waste characterization prior to removal. This information was utilized to evaluate and select disposal options and then to package and ship removed wastes without storage.

9415 (FRCEA-TH–484) **Corrosion mechanisms of containment glasses for fission products.** Nogues, J.L. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Direction du Cycle du Combustible; Montpellier-2 Univ., 34 (France). 26 Jan 1984. 329p. (In French). Order Number DE95618992. Source: OSTI; NTIS (US Sales Only); INIS.

After a review of nuclear energy production and waste vitrification principles, the aqueous corrosion mechanisms of the containment glasses and the various parameters affecting the corrosion are studied: effects of glass composition, temperature, lixiviation agent pH, lixiviation duration and mode. Conventional mass loss measurement and solution analyses are coupled to sophisticated surface analysis techniques. The hydrolyzed layer formation and the solubility limits are discussed. 87 figs., 30 tabs., 144 refs.

9416 (GSF–2/94) **Contributions to surface rock mechanics at the Asse southern flank.** Walter, F.; Wallmueller, R. GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Braunschweig (Germany). Inst. fuer Tieflagerung. 1994. 36p. Sponsored

by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Project Number GSF 73228. (GSF-TL–2/94). Order Number DE95746658. Source: OSTI; NTIS (US Sales Only); INIS.

To improve the knowledge of the mechanical behaviour of the Asse surface rocks, the deep boreholes Remlingen 5 to Remlingen 9 were measured. Data combination and evaluation were effected by means of the MECHPRO and GLOBAL methods. Complementary to this, 39 test specimens of the rocks won there were examined my means of ultrasound and at triaxial static compression at the Gesteinsmechanisches Labor of GSF. Those specimens show clear signs of anisotropy. Stratification is recognizable by material changes and detachments. The report provides indications for interpretation of the logs and gives a short account of the results. In a detailed comparison of methods and results of densities and dynamic elastic parameters from logs and laboratory measurements, correlation equations were defined. The elastic parameters calculated by means of MECHPRO from the logs, reflect rather exactly the real circumstances and can be used as input for numerical models. A comparison of the rock strength data calculated by MECHPRO and those resulting from triaxial compression tests shows that the calculated strength of the rock matrix of the Remlingen logs does not correspond to reality. Based on simplified assumptions, a stationary stress model for the Southern flank was derived and the stress condition effective before the development of the shaft structure was assessed. Fracture conditions were judged according to Coulomb. Evaluations based on the initial assumptions proved the rock masses to be stable. (orig./HP)

9417 (INIS-AR–104) **Characterization of borosilicate glass for immobilization of PHWR type high-level radioactive wastes.** Ollig, M.; Heredia, A.D.; Sbriller, J.C.; Sanfilippo, M.; Prastalo, S.; Sterba, M.E.; Messi de Bernasconi, N.B.; Russo, D.O. 9418 (INIS-mf–14423) **Special scientific programme on use of high energy accelerators for transmutation of actinides and power production.** International Atomic Energy Agency, Vienna (Austria). Sep 1994. 86p. (CONF-9409290–: 38. IAEA general conference, special scientific programme on use of high energy accelerators for transmutation of actinides and power production, Vienna (Austria), 21 Sep 1994). Order Number DE95618648. Source: OSTI; NTIS (US Sales Only); INIS.

Various techniques for the transmutation of radioactive waste through the use of high energy accelerators are reviewed and discussed. In particular, the present publication contains presentations on (i) requirements and the technical possibilities for the transmutation of long-lived radionuclides (background paper); (ii) high energy particle accelerators for bulk transformation of elements and energy generation; (iii) the resolution of nuclear energy issues using accelerator-driven technology; (iv) the use of proton accelerators for the transmutation of actinides and power production; (v) the coupling of an accelerator to a subcritical fission reactor (with a view on its potential impact on waste transmutation); (vi) research and development of accelerator-based transmutation technology at JAERI (Japan); and (vii) questions and problems with regard to accelerator-driven nuclear power and transmutation facilities. Refs, figs and tabs.

9419 (INIS-mf–14423, pp. 3-12) **Transmutation of long-lived radionuclides: Requirements for and review of technical possibilities.** Koch, L. (European Commission, Karlsruhe (Germany). Accelerator-Driven Transmutation Technology is being discussed in a situation where nuclear energy generation faces a loss of acceptance. Disposal of nuclear waste is a major problem faced by nuclear energy generation at present. In this document concept and uses of transmutation of long-lived radionuclide are discussed. It is a useful technique to reduce radiation hazards of nuclear wastes. 6 refs, 4 figs, 1 tab.

9420 (INIS-mf–14423, pp. 36-49) **Resolution of nuclear energy issues using accelerator-driven technology.** Bowman, C.D. (Los Alamos National Lab., Los Alamos, NM (United States). Accelerator-Driven Transmutation Technology). International Atomic Energy Agency, Vienna (Austria). Sep 1994. 86p. (CONF-9409290–: 38. IAEA general conference, special scientific programme on use of high energy accelerators for transmutation of actinides and power production, Vienna (Austria), 21 Sep 1994). Accelerator-Driven Energy Producer (ADEP) produces nuclear energy with transmutation of the long-lived radioactive waste generated during power production. Natural thorium is used as fuel in this reactor and all the long-lived fission product isotopes are transmuted to short-lived radionuclide. Therefore this reactor concept offers nuclear energy with high thermal-to-electrical efficiency, from inexpensive fuel in safe reactor operation conditions and with limited waste storage requirements.

The major candidate scheme for the long-term management in most nuclear countries is the permanent disposal of unpartitioned HLWs, or unreprocessed spent fuels, into a stable geological formation to isolate them from the human environment. However, considerable attention has been directed toward the partitioning and transmutation (P-T); separating long-lived nuclides from HLWs and converting them into shorter-lived or non-radioactive ones. Improvements of long-term safety assurance in the waste management and possible beneficial use of valuable resources in the wastes can be expected through establishing the P-T technologies. In Japan, a national program called "OMEGA" has started from 1988 for research and development of new technologies on nuclear waste partitioning and transmutation. Under the OMEGA program, the Japan Atomic Energy Research Institute (JAERI) is carrying out R and Ds for proton accelerator-based transmutation, together with transmutation with burner fast reactor and advanced partitioning technology. 8 refs, 7 figs, 3 tabs.

9422 (INIS-mf–14445, pp. F-5, 1-12) **Volume reduction of contaminated milk powder by incinerator.** Tiangtrongchitt, S.; Ong-art-harn, C.; Yamkate, P. Office of Atomic Energy for Peace, Bangkok (Thailand). 1988. 440p. (In Thai). (CONF-8804346–: 2. Nuclear science and technology conference, Bangkok (Thailand), 19-22 Apr 1988). In *Proceedings of the second nuclear science and technology conference no. 2.* Order Number DE95619740. Source: OSTI; NTIS (US Sales Only); INIS.

The newly special design incinerator has been put into function early 1987. At the same time, there was a request from Food and Drug Administration, Ministry of Health, to destroy the contaminated milk powder resulting from the nuclear accident at Chernobyl, USSR. The experiment had been conducted therefore to observe the performance of the incineration process. The results show that the decontamination factor, and the volume reduction value are 150 and 57 respectively.

9423 (INIS-mf–14471, pp. 27-30) **Modifying SCALE-4.1 for transmutation calculations.** Shayer, Z. (California Univ., Berkeley, CA (United States). (CONF-9411188–: 1994 joint meeting of the nuclear societies of Israel, Tel Aviv (Israel), 28-29 Nov 1994). In *Transactions of the nuclear societies of Israel Joint meeting 1994*. 234p. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

A special sequence of selected modules and data libraries of the SCALE-41. computer code package was developed for the study of the feasibility of transmuting the transuranium isotopes and long-lived fission products accumulated, in spent fuel from LWRs. The specific reactor type considered for the transmutation is a molten salt reactor that is fueled by, and only by, the transuranium isotopes and long-lived fission products from the light water reactors spent fuel. (authors). 2 refs., 1 fig.

9424 (INIS-mf–15102) **Models for the numerical simulation of radionuclide migration in underground storage of radioactive waste. Final report.** Petschel, M. (NOELL-LGA Gastechnik GmbH, Freiberg (Germany)); Heidenreich, H.; Beger, E.; Schneider, H. Institut fuer Energetik Leipzig GmbH, Dresden (Germany). Mar 1992. 28p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT KWA5911. Order Number DE95754162. Source: OSTI; NTIS (US Sales Only); INIS.

The report contains validation works - implementation, assurance of function, further development of numerical models (where applicable), program and application documentation, data acquisition - for the programs and program systems BIDERA, GEOFIM, GISTZ, KASOMO, APT6 and MARE. (HP)

9425 (KCP–613-5563) **A vehicle mounted multi-sensor array for waste site characterization.** Baumgart, C.W. (AlliedSignal, Kansas City, KS (United States)); Ciarcia, C.A.; Tunnell, T.W. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Feb 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. (CONF-950209–1: 4. international symposium on field screening methods for hazardous wastes and toxic chemicals, Las Vegas, NV (United States), 22-24 Feb 1995). Order Number DE95007213. Source: OSTI; NTIS; INIS; GPO Dep.

Personnel at AlliedSignal Aerospace, Kirtland Operations (formerly EG&G Energy Measurements, Kirtland Operations) and EG&G Energy Measurements, Los Alamos Operations, have successfully developed and demonstrated a number of technologies which can be applied to the environmental remediation and waste management problem. These applications have included the development of self-contained and towed remote sensing platforms and advanced signal analysis techniques for the detection and characterization of subsurface features. This presentation will provide a brief overview of applications that have been and are currently being fielded by both AlliedSignal and EG&G Energy Measurements personnel and will describe some of the ways that such technologies can and are being used for the detection and characterization of hazardous waste sites.

9426 (LA–12821-MS) **High performance ground penetrating radar survey of TA-49/Area 2. Final report.** Hoeberling, R.F. (Los Alamos National Lab., NM (United States)); Rangel, M.J. III. Los Alamos National Lab., NM (United States). Sep 1994. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006856. Source: OSTI; NTIS; INIS; GPO Dep.

The results of high performance ground penetrating radar study of Area 2 at Technical Area 49 are presented. The survey was commissioned as part of Los Alamos Laboratory's continuing Environmental Remediation program and was completed and analyzed before borehole studies in Area 2 were started. Based upon the ground penetrating radar results, the location of one of the planned boreholes was moved to assure the drilling area was as safe as possible. While earlier attempts to use commercial radar devices at this facility had not been successful, the radar and digital processing system developed at Los Alamos were able to significantly improve the buried physical detail of the site.

9427 (LA–12862) **Effects of aqueous-soluble organic compounds on the removal of selected radionuclides from high-level waste part I: Distribution of Sr, Cs, and Tc onto 18 absorbers from an irradiated, organic-containing leachate simulant for Hanford Tank 101-SY.** Marsh, S.F. (Sandia National Labs., Albuquerque, NM (United States)); Svitra, Z.V.; Bowen, S.M. Los Alamos National Lab., NM (United States). Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95008081. Source: OSTI; NTIS; INIS; GPO Dep.

Many of the radioactive waste storage tanks at U.S. Department of Energy facilities contain organic compounds that have been degraded by radiolysis and chemical reactions. In this investigation, we measured the effect of some aqueous-soluble organic compounds on the sorption of strontium, cesium, and technetium onto 18 absorbers that offer high sorption of strontium from organic-free solutions. For our test solution we used a leachate from a simulated slurry for Hanford Tank 101-SY that initially contained ethylenediaminetetraacetic acid (EDTA) and then was gamma-irradiated to 34 Mrads. We measured distribution coefficients (Kds) for each element/absorber combination for dynamic contact periods of 30 min, 2 h, and 6 h to obtain information about sorption kinetics. To facilitate comparisons, we include Kd values for these same element/absorber combinations from three organic-free simulant solutions. The Kd values for strontium sorption from the simulant that contained the degraded organics usually decreased by large factors, whereas the Kd values for cesium and technetium sorption were relatively unaffected.

9428 (LA–12875-MS) **An overview of the development, testing, and application of composite absorbers.** Sebesta, F. (Czech Technical Univ., Brehova (Czech Republic)); John, J. Los Alamos National Lab., NM (United States). Feb 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95007725. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

Although inorganic exchangers offer many advantages for removing selected elements from radioactive waste streams, few of these materials are suitable for use in packed-bed columns. We review various adaptations of inorganic exchangers for use in columns, which include granular forms of the intrinsic absorbers, absorber compounds supported on other materials, and composite absorbers that use organic or inorganic binders. An organic binding polymer of polyacrylonitrile (PAN), developed at the Czech Technical University, has been demonstrated to offer advantages. We describe general methods for preparing inorganic exchange materials, which then are incorporated into PAN-based composites. Such PAN composites have been used to remove selected radionuclides from a variety of liquid waste streams. Sixteen different PAN composites were prepared for testing at Los Alamos National Laboratory (LANL) as part of an evaluation of potential partitioning agents for remediating the liquid waste in underground storage tanks at the Hanford site near Richland, Washington. Our collaboration with LANL is expected to continue for another 2 years.

9429 (LA-SUB–95-4) **Multiple encapsulation of LANL waste using polymers. Final report.** Schwartz, R.L. Los Alamos National Lab., NM (United States). 12 Aug 1994. 267p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95005730. Source: OSTI; NTIS; INIS; GPO Dep.

Polymer encapsulation of lead shielding/blasting grit (surrogate) mixed waste was optimized at bench scale using melamine formaldehyde, polyurethane, and butadiene thermosetting polymers. Three pellet-based intermediate waste forms, and a final waste form, were prepared, each providing an additional level of integrity. Encapsulated waste integrity was measured by chemical and physical techniques. Compliance was established using the Toxicity Characteristic Leaching Procedure. Equipment appropriate

to pilot-scale demonstration of program techniques was investigated. A preliminary equipment list and layout, and process block flow diagram were prepared.

9430 (LA-SUB–95-7) **Hanford Tank Farm interim storage phase probabilistic risk assessment outline.** Los Alamos National Lab., NM (United States); PLG, Inc., Washington, DC (United States). 19 May 1994. 226p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Subcontract 6617K0013-95. Order Number DE95005734. Source: OSTI; NTIS; INIS; GPO Dep.

This report is the second in a series examining the risks for the high level waste (HLW) storage facilities at the Hanford Site. The first phase of the HTF PSA effort addressed risks from Tank 101-SY, only. Tank 101-SY was selected as the initial focus of the PSA because of its propensity to periodically release (burp) a mixture of flammable and toxic gases. This report expands the evaluation of Tank 101-SY to all 177 storage tanks. The 177 tanks are arranged into 18 farms and contain the HLW accumulated over 50 years of weapons material production work. A centerpiece of the remediation activity is the effort toward developing a permanent method for disposing of the HLW tank's highly radioactive contents. One approach to risk based prioritization is to perform a PSA for the whole HLW tank farm complex to identify the highest risk tanks so that remediation planners and managers will have a more rational basis for allocating limited funds to the more critical areas. Section 3 presents the qualitative identification of generic initiators that could threaten to produce releases from one or more tanks. In section 4 a detailed accident sequence model is developed for each initiating event group. Section 5 defines the release categories to which the scenarios are assigned in the accident sequence model and presents analyses of the airborne and liquid source terms resulting from different release scenarios. The conditional consequences measured by worker or public exposure to radionuclides or hazardous chemicals and economic costs of cleanup and repair are analyzed in section 6. The results from all the previous sections are integrated to produce unconditional risk curves in frequency of exceedance format.

9431 (LA-UR–94-3120) **Barriers and post-closure monitoring (AL121125).** Bostick, K.V.; Janecky, D. Los Alamos National Lab., NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006449. Source: OSTI; NTIS; INIS; GPO Dep.

This project focuses on the rapid implementation of near-surface barriers, biotreatment, and post-closure monitoring technology. It uses water-permeable and biologic barriers that chemically capture and/or degrade contaminants without significantly altering the natural water flow regime. Barrier approaches are being tested for two different applications. The first is the use of barriers for confinement of chemical contaminants for in-trench treatments with leach systems or an in-place bioreactor. The second is an enhancement of the current practice of emplacing grout or clay slurry walls into direct horizontal surface and subsurface water flows around a contaminated area by integrating permeable reactive barriers and petroleum reservoir gel/foam/polymer technology.

9432 (LA-UR–94-3121) **Decision support system to select cover systems.** Bostick, K.V. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006447. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this technology is to provide risk managers with a defensible, objective way to select capping alternatives for remediating radioactive and mixed waste landfills. The process of selecting containment cover technologies for mixed waste landfills requires consideration of many complex and interrelated technical, regulatory, and economic issues. A Decision Support System (DSS) is needed to integrate the knowledge of experts from scientific, engineering, and management disciplines to help in selecting the best capping practice for the site.

9433 (LA-UR–94-4160) **Removal of plutonium and Americium from hydrochloric acid waste streams using extraction chromatography.** Schulte, L.D.; FitzPatrick, J.R.; Salazar, R.R.; Schake, B.S.; Martinez, B.T. Los Alamos National Lab., NM (United States). [1995]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-940301–46: 207. spring national meeting of the American Chemical Society (ACS), San Diego, CA (United States), 13-18 Mar 1994). Order Number DE95005263. Source: OSTI; NTIS; INIS; GPO Dep.

Extraction chromatography is under development as a method to lower actinide activity levels in hydrochloric acid (HCl) effluent streams. Successful application of this technique for radioactive liquid waste treatment would provide a low activity feedstream for HCl recycle, reduce the loss of radioactivity to the environment in aqueous effluents, and lower the quantity and improve the form of solid waste generated. The extraction of plutonium and americium from HCl solutions was examined for several commercial and laboratory-produced sorbed resin materials. Polymer beads were coated with n-octyl(phenyl)-N,N-diisobutylcarbamoyl- methylphosphine oxide (CMPO) and either tributyl phosphate (TBP), or diamyl amylphosphonate (DAAP). Distribution coefficients for Pu and Am were measured by contact studies in 1-10 M HCl, while varying REDOX conditions, actinide loading levels, and resin formulations. Flow experiments were run to evaluate actinide loading and elution under varied conditions. Significant differences in the actinide distribution coefficients in contact experiments, and in actinide retention in flow experiments were observed as a function of resin formulation.

9434 (LA-UR–94-4316) **Real-Time Monitoring of Alpha Emissions. Final report, FY 1994.** Gritzo, R.; Fowler, M.; Wouters, J. Los Alamos National Lab., NM (United States). [1994]. 94p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95005254. Source: OSTI; NTIS; INIS; GPO Dep.

A technology is being developed for on-line, real-time monitoring of mixed and low-level incinerator stacks for levels of airborne alpha activity. The Large-Volume Flow Thru Detector System uses a detector composed of multiple parallel plates of scintillating material fabricated so that the entire stack gas stream flows directly through the inter-plate volume. This report is largely a compilation of 3 reports on background reduction, once-through flow tests, and the aeronautical/mechanical engineering work. The full text of each report is included as an appendix.

9435 (LA-UR–94-4351) **Accelerator-based systems for plutonium destruction and nuclear waste transmutation.** Arthur, E.D. Los Alamos National Lab., NM (United States). [1994]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9407161–1: 1995 global conference, Las Vegas, NV (United States), 25-29 Jul 1994). Order Number DE95005248. Source: OSTI; NTIS; INIS; GPO Dep.

Accelerator-base systems are described that can eliminate long-lived nuclear materials. The impact of these systems on global issues relating to plutonium minimization and nuclear waste disposal can be significant. An overview of the components that comprise these systems is given, along with discussion of technology development status and needs. A technology development plan is presented with emphasis on first steps that would demonstrate technical performance.

9436 (LA-UR–95-421) **Experiments comparing the uptake of americium from chloride media using extraction chromatography.** FitzPatrick, J.R.; Schake, B.S.; Schulte, L.D.; Martinez, B.T.; Salazar, R.R. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950216–4: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95006171. Source: OSTI; NTIS; INIS; GPO Dep.

Clean-up of actinide effluent waste steams is of increasing importance at the Los Alamos Plutonium Facility, TA-55, and removing the actinide elements to very low levels allows less radioactivity to go the Los Alamos National Laboratory Water Treatment Facility, TA-50, thus reducing the number of drums of TRU waste. Americium (Am) is a difficult element to remove from chloride media because the +3 state is difficult to oxidize and chelating resins work better with elements such as plutonium which are more readily oxidized to the +4 and/or +6 state. Currently in hydrochloric acid (HC1) media, the acidic liquid waste is neutralized with potassium hydroxide to precipitate the metal hydroxides,

before disposal to TA-50. This process is not very efficient. The removal of Am from chloride media was compared using a series of resins, some commercial and some made in our laboratory, using different percentages by weight of octyl(phenyl)-N,N-diisobutylcarbamoyl-methylphosphine oxide (CMPO) along with diamyl amylphosphonate (DAAP) or tributyl phosphate (TBP) as diluents. Resins were also made with no added diluent. Early comparisons using small-scale contact studies with 0.5 grams of resin in 0.1M-12M HC1, and subsequent small-scale flow experiments show a trend in which Am uptake is proportional to the amount of CMPO on the resins and the diluent plays a minor role in the uptake of Am from these solutions. Redox chemistry effects were also investigated. From these studies, it is possible to determine the best conditions for the removal of Am from HC1 media thus reducing the gross alpha content of the waste stream by a factor of 10-100 which reduces the number of barrels of waste produced at the Water Treatment Facility.

9437 (NEI-FI–251) **Nuclear waste management programme 1995.** Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Sep 1994. 32p. (In Finnish). Order Number DE95621952. Source: OSTI; NTIS; INIS.

Nuclear Waste Commission of Finnish Power Companies (YJT), founded by nuclear energy producing Imatran Voima Oy (IVO) and Teollisuuden Voima Oy (TVO), coordinates the research work of the companies on nuclear waste management. In YJT's Nuclear Waste Management Programme 1995, an account of the nuclear waste management measures of IVO and TVO is given as required by the sections 74 and 75 of the Finnish Nuclear Energy Degree. At first, the nuclear waste management situation and the programme of activities are reported. The nuclear waste management research programme for the year 1995 and more generally for the years 1996-1999 is presented. (3 figs., 1 tab.).

9438 (NUREG/CR–6221) **The Valles natural analogue project.** Stockman, H. (Sandia National Labs., Albuquerque, NM (United States)); Krumhansl, J.; Ho, C.; McConnell, V. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Sandia National Labs., Albuquerque, NM (United States). Dec 1994. 122p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-94AL85000. (SAND–94-0650). Source: OSTI; NTIS; GPO; INIS.

The contact between an obsidian flow and a steep-walled tuff canyon was examined as an analogue for a highlevel waste repository. The analogue site is located in the Valles Caldera in New Mexico, where a massive obsidian flow filled a paleocanyon in the Battleship Rock tuff. The obsidian flow provided a heat source, analogous to waste panels or an igneous intrusion in a repository, and caused evaporation and migration of water. The tuff and obsidian samples were analyzed for major and trace elements and mineralogy by INAA, XRF, X-ray diffraction; and scanning electron microscopy and electron microprobe. Samples were also analyzed for D/H and $^{39}Ar/^{4O}$ isotopic composition. Overall,the effects of the heating event seem to have been slight and limited to the tuff nearest the contact. There is some evidence of devitrification and migration of volatiles in the tuff within 10 meters of the contact, but variations in major and trace element chemistry are small and difficult to distinguish from the natural (pre-heating) variability of the rocks.

9439 (ORNL/ER–291) **Surface radiological investigations at the 0816 Site, Waste Area Grouping 13, Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Tiner, P.F.; Uziel, M.S. Oak Ridge National Lab., TN (United States). Dec 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95005693. Source: OSTI; NTIS; INIS; GPO Dep.

A surface radiological investigation was conducted intermittently from July through September 1994 at the 0816 site, located within Waste Area Grouping (WAG) 13. The survey was performed by members of the Measurement Applications and Development Group, Health Sciences Research Division, Oak Ridge National Laboratory (ORNL) at the request of ORNL Site Environmental Restoration Program Facility Management. The purpose of the survey was to ascertain and document the surface radiological condition of the site subsequent to remedial action activities completed in May 1994. The survey was designed to determine whether any residual surface sod contamination in excess of 120 pCi/g ^{137}Cs (Specified by the Interim Record of Decision) remained at the site.

9440 (ORNL/TM–11710) **Low-level radioactive waste source terms for the 1992 integrated data base.** Loghry, S.L.; Kibbey, A.H.; Godbee, H.W.; Icenhour, A.S.; DePaoli, S.M. Oak Ridge National Lab., TN (United States). Jan 1995. 87p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95006494. Source: OSTI; NTIS; INIS; GPO Dep.

This technical manual presents updated generic source terms (i.e., unitized amounts and radionuclide compositions) which have been developed for use in the Integrated Data Base (IDB) Program of the U.S. Department of Energy (DOE). These source terms were used in the IDB annual report, Integrated Data Base for 1992: Spent Fuel and Radioactive Waste Inventories, Projections, and Characteristics, DOE/RW-0006, Rev. 8, October 1992. They are useful as a basis for projecting future amounts (volume and radioactivity) of low-level radioactive waste (LLW) shipped for disposal at commercial burial grounds or sent for storage at DOE solid-waste sites. Commercial fuel cycle LLW categories include boiling-water reactor, pressurized-water reactor, fuel fabrication, and uranium hexafluoride (UF_6) conversion. Commercial nonfuel cycle LLW includes institutional/industrial (I/I) waste. The LLW from DOE operations is category as uranium/thorium fission product, induced activity, tritium, alpha, and "other". Fuel cycle commercial LLW source terms are normalized on the basis of net electrical output [MW(e)-year], except for UF_6 conversion, which is normalized on the basis of heavy metal requirement [metric tons of initial heavy metal]. The nonfuel cycle commercial LLW source term is normalized on the basis of volume (cubic meters) and radioactivity (curies) for each subclass within the I/I category. The DOE LLW is normalized in a manner similar to that for commercial I/I waste. The revised source terms are based on the best available historical data through 1992.

9441 (ORNL/TM–12245) **A low-temperature process for the denitration of Hanford single-shell tank, nitrate-based waste utilizing the nitrate to ammonia and ceramic (NAC) process.** Mattus, A.J.; Lee, D.D.; Dillow, T.A.; Farr, L.L.; Loghry, S.L.; Pitt, W.W.; Gibson, M.R. Oak Ridge National Lab., TN (United States). Dec 1994. 136p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95006795. Source: OSTI; NTIS; INIS; GPO Dep.

Bench-top feasibility studies with Hanford single-shell tank (SST) simulants, using a new, low-temperature (50 to 60C) process for converting nitrate to ammonia and ceramic (NAC), have conclusively shown that between 85 to 99% of the nitrate can be readily converted. In this process, aluminum powders or shot can be used to convert alkaline, nitrate-based supernate to ammonia and an aluminum oxide-sodium aluminate-based solid which might function as its own waste form. The process may actually be able to utilize already contaminated aluminum scrap metal from various DOE sites to effect the conversion. The final, nearly nitrate-free ceramic-like product can be pressed and sintered like other ceramics. Based upon the starting volumes of 6.2 and 3.1 M sodium nitrate solution, volume reductions of 50 to 55% were obtained for the waste form produced, compared to an expected 35 to 50% volume increase if the Hanford supernate were grouted. Engineering data extracted from bench-top studies indicate that the process will be very economical to operate, and data were used to cost a batch, 1,200-kg NO_3/h plant for working off Hanford SST waste over 20 years. Their total process cost analysis presented in the appendix, indicates that between $2.01 to 2.66 per kilogram of nitrate converted will be required. Additionally, data on the fate of select radioelements present in solution are presented in this report as well as kinetic, operational, and control data for a number of experiments. Additionally, if the ceramic product functions as its own waste form, it too will offer other cost savings associated with having a smaller volume of waste form as well as eliminating other process steps such as grouting.

9442 (ORNL/TM–12631) **A low-temperature process for the denitration of Hanford single-shell tank, nitrate-based waste utilizing the nitrate to ammonia and ceramic (NAC) or nitrate to ammonia and glass (NAG) process: Phase 2 report.** Mattus, A.J.; Walker, J.F. Jr.; Youngblood, E.L.; Farr, L.L.; Lee, D.D.; Dillow, T.A.; Tiegs, T.N. Oak Ridge National Lab., TN (United States). Dec 1994. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95006492. Source: OSTI; NTIS; INIS; GPO Dep.

Continuing benchtop studies using Hanford single-shell tank (SST) simulants and actual Oak Ridge National Laboratory (ORNL) low-level waste (LLW), employing a new denitration process for converting nitrate to ammonia and ceramic (NAC), have conclusively shown that between 85 and 99% of the nitrate can be readily converted to gaseous ammonia. In this process, aluminum powders can be used to convert alkaline, nitrate-based supernate to ammonia and an aluminum oxide-sodium aluminate-based solid. The process may be able to use contaminated aluminum scrap metal from DOE sites to effect the conversion. The final, nitrate-free ceramic product can be pressed and sintered like other ceramics or silica and/or fluxing agents can be added to form a glassy ceramic or a flowable glass product. Based upon the starting volumes of 6.2 and 3.1 M sodium nitrate solution, volume reductions of 50 to 70% were obtained for the waste form produced. Sintered pellets produced from supernate from Melton Valley Storage Tanks (MVSTs) have been leached in accordance with the 16.1 leach test for the radioelements ^{85}Sr and ^{137}Cs. Despite lengthy counting times, ^{85}Sr could not be detected in the leachates. ^{137}Cs was only slightly above background and corresponded to a leach index of 12.2 to 13.7 after 8 months of leaching. Leach testing of unsintered and sintered reactor product spiked with hazardous metals proved that both sintered and unsintered product passed the Toxicity Characteristic Leaching Procedure (TCLP) test. Design of the equipment and flowsheet for a pilot demonstration-scale system to prove the nitrate destruction portion of the NAC process and product formation is under way.

9443 **Recovery of UO_2/PuO_2 in IFR electrorefining process.** Tomczuk, Z.; Miller, W.E. 1992. Filed date 28 Oct 1992. U.S. Patent Application 7-967,652. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95006132. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of a process for converting PuO_2 and UO_2 present in an electrorefiner to the chlorides, by contacting the PuO_2 and UO_2 with Li metal in the presence of an alkali metal chloride salt substantially free of rare earth and actinide chlorides for a time and at a temperature sufficient to convert the UO_2 and PuO_2 to metals while converting Li metal to Li_2O. Li_2O is removed either by reducing with rare earth metals or by providing an oxygen electrode for transporting O_2 out of the electrorefiner and a cathode, and thereafter applying an emf to the electrorefiner electrodes sufficient to cause the Li_2O to disassociate to O_2 and Li metal but insufficient to decompose the alkali metal chloride salt. The U and Pu and excess lithium are then converted to chlorides by reaction with $CdCl_2$.

9444 (PNL–9434-Rev.1) **Organic carbon in Hanford single-shell tank waste.** Toth, J.J.; Willingham, C.E.; Heasler, P.G.; Whitney, P.D. Pacific Northwest Lab., Richland, WA (United States). Jul 1994. 94p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95007523. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents an analysis performed by Pacific Northwest Laboratory (PNL) involving the organic carbon laboratory measurement data for Hanford single-shell tanks (SSTS) obtained from a review of the laboratory analytical data. This activity was undertaken at the request of Westinghouse Hanford Company (WHC). The objective of this study is to provide a best estimate, including confidence levels, of total organic carbon (TOC) in each of the 149 SSTs at Hanford. The TOC analyte information presented in this report is useful as part of the criteria to identify SSTs for additional measurements or monitoring for the organic safety program. This report is a precursor to an investigation of TOC and moisture in Hanford SSTS, in order to provide best estimates for each together in one report. Measured laboratory data were obtained for 75 of the 149 SSTS. The data represent a thorough investigation of data from 224 tank characterization datasets, including core-sampling and process laboratory data. Liquid and solid phase TOC values were investigated by examining selected tanks with both reported TOC values in solid and liquid phases. Some relationships were noted, but there was no clustering of data or significance between the solid and liquid phases. A methodology was developed for estimating the distribution and levels of TOC in SSTs using a logarithmic scale and an analysis of variance (ANOVA) technique. The methodology grouped tanks according to waste type using the Sort On Radioactive Waste Type (SORWT) grouping method. The SORWT model categorizes Hanford SSTs into groups of tanks expected to exhibit similar characteristics based on major waste types and processing histories. The methodology makes use of laboratory data for the particular tank and information about the SORWT group of which the tank is a member. Recommendations for a simpler tank grouping strategy based on organic transfer records were made.

9445 (PNL–9785) **Data Compendium for the Columbia River comprehensive impact assessment.** Eslinger, P.W.; Huesties, L.R.; Maughan, A.D.; Miley, T.B.; Walters, W.H. Pacific Northwest Lab., Richland, WA (United States). Apr 1994. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95007264. Source: OSTI; NTIS; INIS; GPO Dep.

Report includes 2 diskettes designed to run on IBM PC or compatible equipment.

The Columbia River Comprehensive Impact Assessment (CRCIA). The CRCIA is conducted by the Pacific Northwest Laboratory (PNL). The purpose of the CRCIA is to evaluate the current human and ecological risk from the Columbia River attributable to past and present activities on the Hanford Site. Human risk will be addressed for radioactive and hazardous materials over a range of river use options. Ecological risk will be evaluated relative to the health of the current river ecosystem. The initial effort for the CRCIA is the development of a compendium of existing data on Columbia River contamination. This document provides the data compendium. It also includes a discussion of data sources, descriptions of the physical format of the data, and descriptions of the search process used to identify data.

9446 (PNL–10131) **Electrochemical organic destruction in support of Hanford tank waste pretreatment.** Lawrence, W.E.; Surma, J.E.; Gervais, K.L.; Buehler, M.F.; Pillay, G.; Schmidt, A.J. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95002854. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy's Hanford Site in Richland, Washington, has 177 underground storage tanks that contain approximately 61 million gallons of radioactive waste. The current cleanup strategy is to retrieve the waste and separate components into high-level and low-level waste. However, many of the tanks contain organic compounds that create concerns associated with tank safety and efficiency of anticipated separation processes. Therefore, a need exists for technologies that can safely and efficiently destroy organic compounds. Laboratory-scale studies conducted during FY 93 have shown proof-of-principle for electrochemical destruction of organics. Electrochemical oxidation is an inherently safe technology and shows promise for treating Hanford complexant concentrate aqueous/slurry waste. Therefore, in support of Hanford tank waste pretreatment needs, the development of electrochemical organic destruction (ECOD) technology has been undertaken. The primary objective of this work is to develop an electrochemical treatment process for destroying organic compounds, including tank waste complexants. Electroanalytical analyses and bench-scale flow cell testing will be conducted to evaluate the effect of anode material and process operating conditions on the rate of organic destruction. Cyclic voltammetry will be used to identify oxygen overpotentials for the anode materials and provide insight into reaction steps for the electrochemical oxidation of complexants. In addition, a bench-scale flow cell evaluation will

be conducted to evaluate the influence of process operating conditions and anode materials on the rate and efficiency of organic destruction using the nonradioactive a Hanford tank waste simulant.

9447 (PNL–10166) **Field lysimeter studies for performance evaluation of grouted Hanford defense wastes.** Last, G.V.; Serne, R.J.; LeGore, V.L. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 243p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95007633. Source: OSTI; NTIS; INIS; GPO Dep.

The Grout Waste Test Facility (GWTF) consisted of four large field lysimeters designed to test the leaching and migration rates of grout-solidified low-level radioactive wastes generated by Hanford Site operations. Each lysimeter was an 8-m-deep by 2-media closed-bottom caisson that was placed in the ground such that the uppermost rim remained just above grade. Two of these lysimeters were used; the other two remained empty. The two lysimeters that were used (A-1 and B-1) were backfilled with a two-layer soil profile representative of the proposed grout disposal site. The proposed grout disposal site (termed the Grout Treatment Facility Landfill) is located immediately east of the Hanford Site's 200 East Area. This soil profile consisted of a coarse sand into which the grout waste forms were placed and covered by 4 m of a very fine sand. The A-1 lysimeter was backfilled in March 1985, with a grout-solidified phosphate/sulfate liquid waste from N Reactor decontamination and ion exchange resin regeneration. The B-1 lysimeter was backfilled in September 1985 and received a grout-solidified simulated cladding removal waste representative of waste generated from fuel reprocessing operations at the head end of the Plutonium Uranium Extraction (PUREX) plant. Routine monitoring and leachate collection activities were conducted for over three years, terminating in January 1989. Drainage was collected sporadically between January 1989 and December 1992. Decontamination and decommissioning of these lysimeters during the summer of 1994, confirmed the presence of a 15 to 20-cm-long hairline crack in one of the bottom plate welds. This report discusses the design and construction of the GWTF, presents the routine data collected from this facility through January 1989 and subsequent data collected sporadically between 1989 and 1993, and provides a brief discussion concerning preliminary interpretation of the results.

9448 (PNL–10170-Reissue) **Acquisition and reduction of data obtained from tank 101-SY in-situ ball rheometer.** Shepard, C.L. (Pacific Northwest Lab., Richland, WA (United States)); Chieda, M.A.; Kirihara, L.J.; Phillips, J.R.; Shekarriz, A.; Terrones, G.; Abbott, J.; Unal, C.; Pasamehmetoglu, K.O.; Graham, A. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 87p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95007634. Source: OSTI; NTIS; INIS; GPO Dep.

Development of the ball rheometer to measure rheological properties and density of the waste in Hanford Tank 241-SY-101 will be completed around September 1994. This instrument is expected to provide the first-of-its-kind in-situ measurements of the fluid properties of the waste contained within this tank. A mixer pump has been installed in this tank, and this pump has been very successful at mitigating the flammable gas problem associated with Tank 101-SY. The ball rheometer will serve as a diagnostic tool for judging the effectiveness of mixing in Tank 101-SY and others and will be one of few in-situ probes available for diagnostic measurements. Based on experiments performed at Los Alamos National Laboratory and Pacific Northwest Laboratory, it is believed that a generalized Bingham fluid model (Herschel-Bulkley fluid model) may be useful for describing at least some of the waste contained in Tank 101-SY, and data obtained in the tank will initially be reduced using this fluid model. The single largest uncertainty in the determination of the drag force on the ball is the drag force which will be experienced by the cable attached to the ball. This drag can be a substantial fraction of the total drag when the ball is deep within the tank. It is expected that the fluid properties may be history dependent, thus rheological properties of the undisturbed fluid may be different from the same properties after the fluid has been disturbed by passage of the ball. The data collection strategy allows the determination of the waste fluid rheology both in the undisturbed state and after it has been disturbed by the ball. Unlike the rheological parameters, measurement of density requires no model for its interpretation; however, the effects of yield stress may need to be accounted for. This measurement can be made with fairly good accuracy and may provide the most useful data in determination of mixer pump effectiveness.

9449 (PNL–10185) **Aerosol characteristics in the offgas from a pilot-scale sluicing operation.** Ligotke, M.W.; Whyatt, G.A.; Beckette, M.R. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95006367. Source: OSTI; NTIS; INIS; GPO Dep.

A pilot-scale study was performed to simulate conditions anticipated during sluicing operations to retrieve waste in single-shell Tank 241-C-106 at the US Department of Energy's Hanford Site in southeastern Washington. The objective of the study was to identify and characterize the potential aerosol source term at the inlet of the headspace exhaust ventilation system during sluicing operations. The information is needed to support decisions for components to be used in the full-scale operation. A secondary objective was to qualitatively evaluate the visibility during sluicing. Three simulated sluicing tests were performed in the 336 Building's quarter-scale waste tank facility located at Hanford. Scaling relationships were used to guide modifications to the quarter-scale tank to accommodate tests that simulated tank geometry, sluicing, and ventilation conditions in the full-scale tank. Simulated sluicing fluids were targeted on solid and liquid surfaces during the tests. Test conditions were monitored, and aerosol measurements were made in the offgas ventilation duct. Also during the tests, an in-tank camera was used to monitor visibility.

9450 (PNL–10187) **Experimental data and analysis to support the design of an ion-exchange process for the treatment of Hanford tank waste supernatant liquids.** Kurath, D.E.; Bray, L.A.; Brooks, K.P.; Brown, G.N.; Bryan, S.A.; Carlson, C.D.; Carson, K.J.; DesChane, J.R.; Elovich, R.J.; Kim, A.Y. Pacific Northwest Lab., Richland, WA (United States). Dec 1994. 214p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95007954. Source: OSTI; NTIS; INIS; GPO Dep.

Hanford's 177 underground storage tanks contain a mixture of sludge, salt cake, and alkaline supernatant liquids. Disposal options for these wastes are high-level waste (HLW) glass for disposal in a repository or low-level waste (LLW) glass for onsite disposal. Systems-engineering studies show that economic and environmental considerations preclude disposal of these wastes without further treatment. Difficulties inherent in transportation and disposal of relatively large volumes of HLW make it impossible to vitrify all of the tank waste as HLW. Potential environmental impacts make direct disposal of all of the tank waste as LLW glass unacceptable. Although the pretreatment and disposal requirements are still being defined, most pretreatment scenarios include retrieval of the aqueous liquids, dissolution of the salt cakes, and washing of the sludges to remove soluble components. Most of the cesium is expected to be in the aqueous liquids, which are the focus of this report on cesium removal by ion exchange. The main objectives of the ion-exchange process are removing cesium from the bulk of the tank waste (i.e., decontamination) and concentrating the separated cesium for vitrification. Because exact requirements for removal of ^{137}Cs have not yet been defined, a range of removal requirements will be considered. This study addresses requirements to achieve ^{137}Cs levels in LLW glass between (1) the Nuclear Regulatory Commission (NRC) Class C (10 CFR 61) limit of 4600 Ci/m^3 and (2) 1/10th of the NRC Class A limit of 1 Ci/m^3 i.e., 0.1/m^3. The required degrees of separation of cesium from other waste components is a complex function involving interactions between the design of the vitrification process, waste form considerations, and other HLW stream components that are to be vitrified.

9451 (PNL–10191) **Product consistency testing of West Valley Compositional Variation Glasses.** Olson, K.M.; Marschman, S.C.; Piepel, G.F.; Whiting, G.K. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 68p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95004246. Source: OSTI; NTIS; INIS; GPO Dep.

Nuclear waste glass produced by the West Valley Demonstration Project (WVDP) must meet the requirements of the Waste Acceptance Preliminary Specification (WAPS) as developed by the US Department of Energy (DOE). To assist WVDP in complying with WAPS, the Materials Characterization Center (MCC) at Pacific Northwest Laboratory (PNL) used the Product Consistency Test (PCT) to evaluate 44 West Valley glasses that had previously been tested in FY 1987 and FY 1988. This report summarizes the results of the PCTs. The glasses tested, which were fabricated as sets of Compositional Variation Glasses for studies performed by the West Valley Support Task (WVST) at PNL during FY 1987 and FY 1988, were doped with Th and U and were variations of West Valley reference glasses. In addition, Approved Reference Material-1 (ARM-1) was used as a test standard (ARM-1 is supplied by the MCC). The PCT was originated at Westinghouse Savannah River Company (WSRC) by C. M. Jantzen and N. R. Bibler (Jantzen and Bibler 1989). The test is a seven-day modified MCC-3 test that uses crushed glass in the size range -100 +200 mesh with deionized water in a Teflon container. There is no agitation during the PCT, and no attempt to include CO_2 from the test environment. Based on B and Li release, the glasses performed about the same as in previous modified MCC-3 testing performed in FY 1987 and FY 1988 (Reimus et al. 1988). The modified MCC-3 tests performed by Reimus et al. were similar to the PCT containers and the exclusion of CO_2 from the tests.

9452 (PNL–10210) **Characterization plan for Hanford spent nuclear fuel.** Abrefah, J.; Thornton, T.A.; Thomas, L.E.; Berting, F.M.; Marschman, S.C. Pacific Northwest Lab., Richland, WA (United States). Dec 1994. 116p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95005062. Source: OSTI; NTIS; INIS; GPO Dep.

Reprocessing of spent nuclear fuel (SNF) at the Hanford Site Plutonium-Uranium Extraction Plant (PUREX) was terminated in 1972. Since that time a significant quantity of N Reactor and Single-Pass Reactor SNF has been stored in the 100 Area K-East (KE) and K-West (KW) reactor basins. Approximately 80% of all US Department of Energy (DOE)-owned SNF resides at Hanford, the largest portion of which is in the water-filled KE and KW reactor basins. The basins were not designed for long-term storage of the SNF and it has become a priority to move the SNF to a more suitable location. As part of the project plan, SNF inventories will be chemically and physically characterized to provide information that will be used to resolve safety and technical issues for development of an environmentally benign and efficient extended interim storage and final disposition strategy for this defense production-reactor SNF.

9453 (PNL–10359-Vol.1) **Property/composition relationships for Hanford high-level waste glasses melting at 115°C volume 1: Chapters 1-11.** Hrma, P.R.; Piepel, G.F. Pacific Northwest Lab., Richland, WA (United States). Dec 1994. 344p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95007952. Source: OSTI; NTIS; INIS; GPO Dep.

A Composition Variation study (CVS) is being performed within the Pacific Northwest Laboratory Vitrification Technology Development (PVTD) project in support of a future high-level nuclear waste vitrification plant at the Hanford site in Washington. From 1989 to 1994, over 120 nonradioactive glasses were melted and properties measured in five statistically-designed experimental phases. Glass composition is represented by the 10 components SiO_2, B_2O_3, Al_2O_3, Fe_2O_3, ZrO_2, Na_2O, Li_2O, CaO, MgO, and Others (all remaining components). The properties measured include viscosity (η), electrical conductivity (ϵ), glass transition temperature (T_g), thermal expansion of solid glass (α_s) and molten glass (α_m), crystallinity (quenched and canister centerline cooled glasses), liquidus temperature (T_L), durability based on normalized elemental releases from the Materials Characterization Center-1 28-day dissolution test (MCC-1, r_{mi}) and the 7-day Product Consistency Test (PCT, r_{pi}), and solution pHs from MCC-1 and PCT. Amorphous phase separation was also evaluated. Empirical first- and second-order mixture models were fit using the CVS data to relate the various properties to glass composition. Equations for calculating the uncertainty associated with property values predicted by the models were also developed. The models were validated using both internal and external data. Other modeling approaches (e.g., non-bridging oxygen, free energy of hydration, phase-equilibria T_L) were investigated for specific properties. A preliminary Qualified Composition Region was developed to identify glass compositions with high confidence of being processable in a melter and meeting waste form acceptance criteria.

9454 (PNL–10359-Vol.2) **Property/composition relationships for Hanford high-level waste glasses melting at 1150°C volume 2: Chapters 12-16 and appendices A-K.** Hrma, P.R.; Piepel, G.F. Pacific Northwest Lab., Richland, WA (United States). Dec 1994. 421p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95007953. Source: OSTI; NTIS; INIS; GPO Dep.

A Composition Variation Study (CVS) is being performed within the Pacific Northwest Laboratory Vitrification Technology Development (PVTD) project in support of a future high-level nuclear waste vitrification plant at the Hanford site in Washington. From 1989 to 1994, over 120 nonradioactive glasses were melted and properties measured in five statistically-designed experimental phases. Glass composition is represented by the 10 components SiO_2, B_2O_3, ZrO_2, Na_2O, Li_2O, CaO, MgO, and Others (all remaining components). The properties measured include viscosity (η), electrical conductivity (ϵ), glass transition temperature (T_g), thermal expansion of solid glass (α_s) and molten glass (α_m), crystallinity (quenched and canister centerline cooled glasses), liquidus temperature (T_L), durability based on normalized elemental releases from the Materials Characterization Center-1 28-day dissolution test (MCC-1, r_{mi}) and the 7-day Product Consistency Test (PCT, r_{pi}), and solution pHs from MCC-1 and PCT. Amorphous phase separation was also evaluated. Empirical first- and second-order mixture models were fit using the CVS data to relate the various properties to glass composition. Equations for calculating the uncertainty associated with property values predicted by the models were also developed. The models were validated using both internal and external data. Other modeling approaches (e.g., non-bridging oxygen, free energy of hydration, phase-equilibria T_L) were investigated for specific properties. A preliminary Qualified Composition Region was developed to identify glass compositions with high confidence of being processable in a melter and meeting waste form acceptance criteria.

9455 (PNL–10364) **A chemical basis for the partitioning of radionuclides in incinerator operation.** Burger, L.L. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95007263. Source: OSTI; NTIS; INIS; GPO Dep.

Incineration as a method of treating radioactive or mixed waste is attractive because of volume reduction, but may result in high concentrations of some hazardous components. For safety reasons during operation, and because of the environmental impact of the plant, it is important to know how these materials partition between the furnace slay, the fly ash, and the stack emission. The chemistry of about 50 elements is discussed and through consideration of high temperature thermodynamic equilibria, an attempt is made to provide a basis for predicting how various radionuclides and heavy metals behave in a typical incinerator. The chemistry of the individual elements is first considered and a prediction of the most stable chemical species in the typical incinerator atmosphere is made. The treatment emphasizes volatility and the parameters considered are temperature, acidity, oxygen, sulfur, and halogen content, and the presence of several other key non-radioactive elements. A computer model is used to calculate equilibrium concentrations of many species in several systems at temperatures ranging from 500 to 1600°K. It is suggested that deliberate addition of various feed chemicals can have a major impact on the fate of many radionuclides and heavy metals. Several problems concerning limitations and application of the data are considered.

9456 (PNL–10370) **324 Radiochemical engineering cells and high level vault tanks mixed waste compliance status.** Pacific Northwest Lab., Richland, WA (United States). 29 Dec 1994. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95005398. Source: OSTI; NTIS; INIS; GPO Dep.

The 324 Building in the Hanford 300 Area contains Radiochemical Engineering Cells and High Level Vault tanks (the "REC/HLV") for research and development activities involving radioactive materials. Radioactive mixed waste within this research installation, found primarily in B-Cell and three of the high level vault tanks, is subject to RCRA/DWR ("RCRA") regulations for storage. This white paper provides a baseline RCRA compliance summary of MW management in the REC/HLV, based on best available knowledge. The REC/HLV compliance project, of which this paper is a part, is intended to achieve the highest degree of compliance practicable given the special technical difficulties of managing high activity radioactive materials, and to assure protection of human health and safety and the environment. The REC/HLV was constructed in 1965 to strict standards for the safe management of highly radioactive materials. Mixed waste in the REC/HLV consists of discarded tools and equipment, dried feed stock from nuclear waste melting experiments, contaminated particulate matter, and liquid feed stock from various experimental programs in the vault tanks. B-Cell contains most of these materials. Total radiological inventory in B-Cell is estimated at 3 MCi, about half of which is potentially "dispersible", that is, it is in small pieces or mobile particles. Most of the mixed waste currently in the REC/HLV was generated or introduced before mixed wastes were subjected to RCRA in 1987.

9457 (PNL–10395) **Multimedia Environmental Pollutant Assessment System (MEPAS) application guidance. Guidelines for evaluating MEPAS input parameters for Version 3.1.** Buck, J.W.; Whelan, G.; Droppo, J.G. Jr.; Strenge, D.L.; Castleton, K.J.; McDonald, J.P.; Sato, C.; Streile, G.P. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 205p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95007525. Source: OSTI; NTIS; INIS; GPO Dep.

The Multimedia Environmental Pollutant Assessment System (MEPAS) was developed by Pacific Northwest Laboratory (PNL) for the U.S. Department of Energy (DOE) Office of Environment, Safety and Health and Office of Environmental Management and Environmental Restoration. MEPAS is a set of computer codes developed to provide decision makers with risk information integrated for hazardous, radioactive, and mixed-waste sites based on their potential hazard to public health. It is applicable to a wide range of environmental management and regulatory conditions, including inactive sites covered under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and active air and water releases covered under the Clean Air Act, the Clean Water Act, and the Resource Conservation and Recovery Act. MEPAS integrates contaminant release, transport, and exposure models into a single system. An interactive user interface assists the investigator in defining problems, assembling data and entering input, and developing reports. PNL has compiled two documents that explain the methodology behind the MEPAS model and instruct the user in how to input, retrieve, and evaluate data. This report contains detailed guidelines for defining the input data required to conduct an analysis with MEPAS. Entries for each variable have a short definition, units, and text explaining what a variable is and how it can be quantified. As appropriate, ranges and typical values are given. This report also contains listings of the input screens (worksheets) that are used in the MEPAS user interface for these variables.

9458 (PNL–10400-Draft) **Identification of contaminants of concern Columbia River Comprehensive Impact Assessment.** Napier, B.A.; Batishko, N.C.; Heise-Craff, D.A.; Jarvis, M.F.; Snyder, S.F. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 111p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95006489. Source: OSTI; NTIS; INIS; GPO Dep.

The Columbia River Comprehensive Impact Assessment (CRCIA) Project at the Pacific Northwest Laboratory (PNL) is evaluating the current human and ecological risks from contaminants in the Columbia River. The risks to be studied are those attributable to past and present activities on the Hanford Site. The Hanford Site is located in southcentral Washington State near the town of Richland. Human risk from exposure to radioactive and hazardous materials will be addressed for a range of river use options. Ecological risk will be evaluated relative to the health of the current river ecosystem. The overall purpose of the project is to determine if enough contamination exists in the Columbia River to warrant cleanup actions under applicable environmental regulations. This report documents an initial review, from a risk perspective, of the wealth of historical data concerning current or potential contamination in the Columbia River. Sampling data were examined for over 600 contaminants. A screening analysis was performed to identify those substances present in such quantities that they may pose a significant human or ecological risk. These substances will require a more detailed analysis to assess their impact on humans or the river ecosystem.

9459 (PNL–10417) **An assessment of the dilution required to mitigate Hanford tank 241-SY-101.** Hudson, J.D. (Pacific Northwest Lab., Richland, WA (United States)); Bredt, P.R.; Felmy, A.R.; Stewart, C.W.; Tingey, J.M.; Trent, D.S.; Barney, G.S.; Herting, D.L.; Larrick, A.P.; Reynolds, D.A. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95007951. Source: OSTI; NTIS; INIS; GPO Dep.

A group of experts from PNL and WHC convened November 2 and 3, 1994, to screen the current state of knowledge about dilution and reach a consensus on the minimum dilution ratio that will achieve passive mitigation of Tank 241-SY-101 wastes and the dilution ratio that would satisfy the given cross-site transfer criteria with reasonable assurance. The panel evaluated the effects of dilution on the parameters important in gas generation, retention, and release and reached the following conclusions, which are deduced from the existing body of data, experience, and analyses: (1) Dissolution of solids is the single most important aspect of mitigation by dilution. We are confident that diluting until nitrates, nitrites, and aluminum salts are dissolved will mitigate Hanford flammable gas tanks; (2) Sufficient solids dissolution can be achieved in Tank 241-SY-101 at a dilution ratio of 1:1, which will result in a average specific gravity of approximately 1.35. It is likely that a 0.5:1 dilution will also mitigate 241-SY-101, but the current uncertainty is too high to recommend this dilution ratio; (3) The recommended dilution requires a diluent with at least 2 molar free hydroxide, because aluminum probably precipitates at lower hydroxide concentrations. The transfer criteria for Tank 241-SY-101 waste were also evaluated. These criteria have been specified as solids content $\leq$30% (volume), viscosity $\leq$30% cP and density $<$1.5 g/mL. (1) Solids content is the limiting criterion if it is defined as volume fraction of settled solids. A 1:1 dilution will satisfy this criterion at nominal premixing conditions in Tank 241-SY-101; however, analysis of Window E core samples suggests that up to 1.5:1 might be required. If the solids content is interpreted simply as solids volume fraction no further dilution is necessary, because Tank 241-SY-101 waste (excluding the crust) is already below 30%; (2) Bulk density is the next limiting criterion and is met at 0.4:1 dilution.

9460 (PNL-SA–20933) **Research and development support of the Hanford site tank waste remediation system.** Johnson, B.M. (Pacific Northwest Lab., Richland, WA (United States)); Wodrich, D.D. Pacific Northwest Lab., Richland, WA (United States). Aug 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920851–99: Spectrum '92: nuclear and hazardous waste management international topical meeting, Boise, ID (United States), 23-27 Aug 1992). Order Number DE95004931. Source: OSTI; NTIS; INIS; GPO Dep.

The research and development of new technology in support of the tank waste remediation system (TWRS) program at Hanford is largely driven by the unique situation with the Hanford radioactive tank wastes. The operational history at Hanford has involved three different major processes and several major campaigns to recover fission products from the wastes, and has not maintained a segregation of the high-level wastes. The result is a very diverse

inventory with very high content of solids of many different chemical constituents and great complexity. The R & D program must not only assure that an acceptable strategy for remediation of these wastes can be put in place, it must also define ways of improving the cost effectiveness of the strategy to make the mammoth task more tractable.

9461 (PNL-SA–20950) **A review of occupational safety and health issues relevant to the Environmental Restoration Program: Selected case histories and associated issues.** Lesperance, A.M.; Siegel, M.R.; McKinney, M.C. Pacific Northwest Lab., Richland, WA (United States). Aug 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-940815–109: International nuclear and hazardous waste management conference, Atlanta, GA (United States), 14-18 Aug 1994). Order Number DE95005402. Source: OSTI; NTIS; INIS; GPO Dep.

Since the 1940s, US Department of Energy (DOE) sites have been used for nuclear materials processing and production, warhead testing, and weapons research and development. These activities have resulted in extensive environmental contamination. DOE has established a goal to cleanup and restore the groundwater, soils, sediments, and surface water at its facilities across the nation. To achieve this goal, many workers will be needed to conduct the cleanup. These workers will need training and will be required to follow occupational safety and health (OSH) regulations and guidelines. Compliance with the OSH regulations and guidelines will have an anomous influence on the schedule, money, and technology needed for environmental restoration. Therefore, one area that must be considered in the early stages of long-term planning is the impact of OSH issues on the environmental restoration process. The DOE Office of Environmental Restoration and Waste Management has requested that the Pacific Northwest Laboratory (PNL) investigate the impact of these issues on the environmental restoration process.

9462 (PNL-SA–23947) **Transparent access to distributed, heterogeneous environmental information systems.** Brown, J.C.; Kissinger, B.A. Pacific Northwest Lab., Richland, WA (United States). Sep 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9409293–1: 5. international conference on database and expert systems applications, Athens (Greece), 7-9 Sep 1994). Order Number DE95007268. Source: OSTI; NTIS; GPO Dep.

Quality situation assessment and decision making require access to multiple sources of data and information. The question facing today's analyst is not so much "Is the data I need to do my work available?" as "How can I get to the data I need to make an informed decision?" Insufficient accessibility to data exists for many large corporations and Government agencies. By utilizing current advances in computer technology, today's situation analysts have a wealth of information at their disposal. There are many potential solutions to the information accessibility problem using today's technology. The United States Department of Energy (US-DOE) faced this situation when dealing with the problem of high level radioactive waste (HLW) tanks in the United States. The result of their efforts has been the creation of the Tank Waste Information Network System – TWINS. The TWINS solution combines many technologies to address problems in several areas such as user interfaces, transparent access to multiple data sources, and integrated data access. Data related to the HLW tank complex is currently distributed throughout several US-DOE installations. Over time, each installation has adopted its own set of standards for information management, hardware, and software platforms. These factors contribute to the complexity of accessing information in a manner that enhances the performance and decision making process of the analysts. This paper presents one approach taken by the US-DOE to resolve the problem of distributed, heterogeneous, multi-media information management through the development of multilevel architectural controls and access mechanisms for the HLW Tank complex. The information system architecture developed for the US-DOE by the TWINS effort is one that is adaptable to other problem domains and uses.

9463 (PNL-SA–23965) **Development and feasibility of a waste package coupled reactive transport model (AREST-CT).** Engel, D.W.; McGrail, B.P.; Fort, J.A.; Roberts, J.S. Pacific Northwest Lab., Richland, WA (United States). May 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-940553–83: International high-level radioactive waste management conference, Las Vegas, NV (United States), 22-26 May 1994). Order Number DE95007260. Source: OSTI; NTIS; INIS; GPO Dep.

Most models that analyze the waste package and engineered barrier system (near-field) of an underground geologic repository assume constant boundary conditions at the waste form surface and constant chemical properties of the groundwater. These models are useful for preliminary modeling, iterative modeling to estimate uncertainties, and as a source for a total systems analysis. However, the chemical behavior of the system is a very important factor in the containment and release of radionuclides, and one needs to understand the underlying processes involved. Therefore, the authors are developing a model to couple the calculation of the chemical properties with the reactive transport which can be used to assess the near-field. This report describes the models being implemented and presents some simple analyses demonstrating the feasibility of the chemical and coupled transport models.

9464 (PNL-SA–23997) **Hanford solid waste management system simulation.** Shaver, S.R.; Armacost, L.L.; Konynenbelt, H.S.; Wehrman, R.R. Pacific Northwest Lab., Richland, WA (United States). Dec 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941256–2: Winter simulation conference, Orlando, FL (United States), 11-14 Dec 1994). Order Number DE95007155. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes systems analysis and simulation model development for a proposed solid waste management system at a U.S. Department of Energy Site. The proposed system will include a central storage facility, four treatment facilities, and three disposal sites. The material managed by this system will include radioactive, hazardous, and mixed radioactive and hazardous wastes. The objective of the modeling effort is to provide a means of evaluating throughput and capacity requirements for the proposed treatment, storage, and disposal facilities. The model is used to evaluate alternative system configurations and the effect on the alternatives of changing waste stream characteristics and receipt schedules. An iterative modeling and analysis approach is used that provides macro-level models early in the project and establishes credibility with the customer. The results from the analyses based on the macro models influence system design decisions and provide information that helps focus subsequent model development. Modeling and simulation of alternative system configurations and operating strategies yield a better understanding of the solid waste system requirements. The model effectively integrates information obtained through systems analysis and waste characterization to provide a consistent basis for system and facility planning.

9465 (PNL-SA–24093) **A chemical basis for the partitioning of radionuclides in incinerator operation.** Burger, L.L. Pacific Northwest Lab., Richland, WA (United States). Sep 1994. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9409178–15: American Chemical Society meeting on industrial and engineering chemistry, Atlanta, GA (United States), 19-21 Sep 1994). Order Number DE95005403. Source: OSTI; NTIS; INIS; GPO Dep.

For waste containing small amounts of radioactivity, rad waste (RW), or mixed waste (MW) containing both radioactive and chemically hazardous components, incineration is a logical management candidate because of inherent safety, waste volume reduction, and low costs. Successful operation requires that the facility is properly designed and operated to protect workers and to limit releases of hazardous materials. The large decrease in waste volume achieved by incineration also results in a higher concentration of most of the radionuclides and non radioactive heavy metals in the ash products. These concentrations impact subsequent treatment and disposal. The various constituents (chemical elements) are not equal in concentration in the various incinerator feed materials, nor are they equal in their contribution to health risks on subsequent handling, or accidental release. Thus, for management of the

wastes it is important to be able to predict how the nuclides partition between the primary combustion residue which may be an ash or a fused slag, the fine particulates or fly ash that is trapped in the burner off-gas by several different techniques, and the airborne fraction that escapes to the atmosphere. The objective of this report is to provide an estimate of how different elements of concern may behave in the chemical environment of the incinerator. The study briefly examines published incinerator operation data, then considers the properties of the elements of concern, and employs thermodynamic calculations, to help predict the fate of these RW and MW constituents. Many types and configurations of incinerators have been designed and tested.

9466 (PNL-SA–24110) **Predicting environmental restoration activities through static simulation.** Ross, T.L.; King, D.A.; Wilkins, M.L.; Forward, M.F. Pacific Northwest Lab., Richland, WA (United States). Dec 1994. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941256–1: Winter simulation conference, Orlando, FL (United States), 11-14 Dec 1994). Order Number DE95007166. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discusses a static simulation model that predicts several performance measures of environmental restoration activities over different remedial strategies. Basic model operation consists of manipulating and processing waste streams via selecting and applying remedial technologies according to the strategy. Performance measure prediction is possible for contaminated soil, solid waste, surface water, groundwater, storage tank, and facility sites. Simulations are performed for the U.S. Department of Energy in support of its Programmatic Environmental Impact Statement.

9467 (PNL-SA–24222) **Models for recurrent gas release event behavior in hazardous waste tanks.** Anderson, D.N. (Pacific Northwest Lab., Richland, WA (United States)); Arnold, B.C. Pacific Northwest Lab., Richland, WA (United States). Aug 1994. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-940806–1: 6. international congress of ecology: ecological progress to meet the challenge of environmental change, Manchester (United Kingdom), 20-26 Aug 1994). Order Number DE95004902. Source: OSTI; NTIS; INIS; GPO Dep.

Certain radioactive waste storage tanks at the United States Department of Energy Hanford facilities continuously generate gases as a result of radiolysis and chemical reactions. The congealed sludge in these tanks traps the gases and causes the level of the waste within the tanks to rise. The waste level continues to rise until the sludge becomes buoyant and "rolls over", changing places with heavier fluid on top. During a rollover, the trapped gases are released, resulting, in a sudden drop in the waste level. This is known as a gas release event (GRE). After a GRE, the wastes leading to another GRE. We present nonlinear time waste recongeals and gas again accumulates leading to another GRE. We present nonlinear time series models that produce simulated sample paths that closely resemble the temporal history of waste levels in these tanks. The models also imitate the random GRE, behavior observed in the temporal waste level history of a storage tank. We are interested in using the structure of these models to understand the probabilistic behavior of the random variable "time between consecutive GRE's". Understanding the stochastic nature of this random variable is important because the hydrogen and nitrous oxide gases released from a GRE, are flammable and the ammonia that is released is a health risk. From a safety perspective, activity around such waste tanks should be halted when a GRE is imminent. With credible GRE models, we can establish time windows in which waste tank research and maintenance activities can be safely performed.

9468 (PNL-SA–24289) **Barriers to development and deployment of innovative waste minimization technologies.** Flores, E.A.; Donaghue, J.F. Pacific Northwest Lab., Richland, WA (United States). Aug 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-940853–13: Summer meeting of the American Institute of Chemical Engineers, Denver, CO (United States), 14-17 Aug 1994). Order Number DE95004932. Source: OSTI; NTIS; INIS; GPO Dep.

Increasing regulation and scrutiny is driving waste generators towards reducing the use of scarce natural resources and reducing or eliminating was streams. There is increasing emphasis on developing and deploying technologies that meet industry needs for recovering valuable materials in a cost-effective manner. At the Department of Energy's (DOE) Hanford Site, Battelle operates Pacific Northwest Laboratory (PNL). PNL's mission is to develop technologies to clean up the environment, and to assist industry in being competitive on a global scale. One such technology developed by PNL is the Waste Acid Detoxification and Reclamation (WADR) process. This technology recovers acids from metal-bearing spent solutions, separating out the metals (which are a valuable byproduct of the acid recycling operation) from the acids. WADR uses selective precipitation and distillation together in an innovative waste recycling technology. Selective precipitation removes the heavy metals, and vacuum distillation recovers clean acid. However, WADR and other innovative waste reduction technologies face numerous barriers to successful development and deployment in the field.

9469 (PNL-SA–24508) **Control of Eolian soil erosion from waste site surface barriers.** Ligotke, M.W. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941124–14: 33. Hanford symposium on health and the environment: symposium on in-situ remediation–scientific basis for current and future technologies, Richland, WA (United States), 7-11 Nov 1994). Order Number DE95007285. Source: OSTI; NTIS; INIS; GPO Dep.

Physical models were tested in a wind tunnel to determine optimum surface-ravel admixtures for protecting silt-loam soil from erosion by, wind and saltating, sand stresses. The tests were performed to support the development of a natural-material surface barrier for and waste sites. Plans call for a 2-m deep silt-loam soil reservoir to retain infiltrating water from rainfall and snowmelt. The objective of the study was to develop a gravel admixture that would produce an erosion-resistant surface layer during, periods of extended dry climatic stress. Thus, tests were performed using simulated surfaces representing dry, unvegetated conditions present just after construction, after a wildfire, or during an extended drought. Surfaces were prepared using silt-loam soil mixed with various grades of sand and Travel. Wind-induced surface shear stresses were controlled over the test surfaces, as were saltating, sand mass flow rates and intensities. Tests were performed at wind speeds that approximated and exceeded local 100-year peak gust intensities. Surface armors produced by pea gravel admixtures were shown to provide the best protection from wind and saltating sand stresses. Compared with unprotected silt-loam surfaces, armored surfaces reduced erosion rates by more than 96%. Based in part on wind tunnel results, a pea gravel admixture of 15% will be added to the top 1 in of soil in a prototype barrier under construction in 1994. Field tests are planned at the prototype site to provide data for comparison with wind tunnel results.

9470 (PNL-SA–24754) **Automated remedial assessment methodology software system.** Whiting, M.; Wilkins, M.; Stiles, D. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941113–2: Conference on development and application of computer techniques to environmental studies: Envirosoft '94, San Francisco, CA (United States), 16-18 Nov 1994). Order Number DE95007287. Source: OSTI; NTIS; INIS; GPO Dep.

The Automated Remedial Analysis Methodology (ARAM) software system has been developed by the Pacific Northwest Laboratory to assist the U.S. Department of Energy (DOE) in evaluating cleanup options for over 10,000 contaminated sites across the DOE complex. The automated methodology comprises modules for decision logic diagrams, technology applicability and effectiveness rules, mass balance equations, cost and labor estimating factors and equations, and contaminant stream routing. ARAM is used to select technologies for meeting cleanup targets; determine the effectiveness of the technologies in destroying, removing, or immobilizing contaminants; decide the nature and

amount of secondary waste requiring further treatment; and estimate the cost and labor involved when applying technologies.

9471 (PSI–95-01) **Propagation of a hyperalkaline plume into the geological barrier surrounding a radioactive waste repository.** Lichtner, P.C. (Bern Univ., Geologisches und Mineralogisches Inst., Bern (Switzerland)); Eikenberg, J. Paul Scherrer Inst. (PSI), Villigen (Switzerland). Jan 1995. 65p. Order Number DE95618996. Source: OSTI; NTIS; INIS.

A coupled geochemical transport model (MPATH) which includes chemical reaction kinetics is used to evaluate the alteration of Swiss argillaceous sediments in a high-pH environment and to predict the spatial propagation of the hyperalkaline plume with time. The calculations predict dissolution of quartz, clay minerals and chlorite, and precipitation of zeolite minerals such as analcime and natrolite as well as he feldspars K-feldspar and albite. In addition, Portland cement-hydrates such as calcium silicate and aluminate hydrates, ettringite and friedel-salt are also predicted to form, depending on the composition of the inlet fluid and the host rock. The dissolution of clay minerals reduces the pH of the hyperalkaline plume to levels between approximately 8 and 10, depending on the composition of the inlet fluid and the host rock. For pure advective transport through porous medium, neglecting changes in porosity and permeability, the migration velocity of the high-pH front is calculated to be approximately one to two orders of magnitude less than that of the infiltrating groundwater. However, due to precipitation of secondary phases, in the present model concept a rapid decrease in porosity of the marl occurs several meters from the repository. At the interface between the marl host rock and cement the porosity increases as a consequence of the low silica concentration of the cement pore fluid. (author) 10 figs., 7 tabs., refs.

9472 (RFP–4924) **Cementation and solidification of miscellaneous mixed wastes at the Rocky Flats Environmental Technology Site.** Phillips, J.A.; Semones, G.B. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. (CONF-950216–23: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95007210. Source: OSTI; NTIS; INIS; GPO Dep.

The Rocky Flats Environmental Technology Site produces a variety of wastes which are amenable to micro-encapsulation in cement Portland cement is an inexpensive and readily available material for this application. The Waste Projects (WP) group at Rocky Flats evaluated cementation to determine its effectiveness in encapsulating several wastes. These included waste analytical laboratory solutions, incinerator ash, hydroxide precipitation sludge, and an acidic solution from the Delphi process (a chemical oxidation technology being evaluated as an alternative to incineration). WP prepared surrogate wastes and conducted designed experiments to optimize the cement formulation for the waste streams. These experiments used a Taguchi or factorial experimental design, interactions between the variables were also considered in the testing. Surrogate waste samples were spiked with various levels of each of six Resource Conservation and Recovery Act (RCRA) listed metals (Cd, Cr, Ba, Pb, Ni, and Ag), cemented using the optimized formulation, and analyzed for leach resistance using the Toxicity Characteristic Leaching Procedure (TCLP). The metal spike levels chosen were based on characterization data, and also based on an estimate of the highest levels of contaminants suspected in the waste. This paper includes laboratory test results for each waste studied. These include qualitative observations as well as quantitative data from TCLP analyses and environmental cycling studies. The results from these experiments show that cement stabilization of the different wastes can produce final waste forms which meet the current RCRA Land Disposal Restriction (LDR) requirements. Formulations that resulted in LDR compliant waste forms are provided. The volume increases associated with cementation are also lower than anticipated. Future work will include verification studies with actual mixed radioactive waste as well as additional formulation development studies on other waste streams.

9473 (SAND–94-0599C) **Integrated modeling and experimental programs to predict brine and gas flow at the Waste Isolation Pilot Plant.** Beauheim, R.L.; Howarth, S.M.; Vaughn, P.; Webb, S.W.; Larson, K.W. Sandia National Labs., Albuquerque, NM (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941053–1: International symposium on validation through model testing with experiments, Paris (France), 11-14 Oct 1994). Order Number DE95005425. Source: OSTI; NTIS; INIS; GPO Dep.

Evaluation of the performance of the WIPP repository involves modeling of brine and gas flow in the host rocks of the Salado Formation, which consist of halite and anhydrite interbeds. Numerous physical, chemical, and structural processes, must be understood to perform this modeling. Gas generation within the repository is strongly coupled to the amount of brine inflow to the repository because brine aids in the corrosion of metals and associated generation of hydrogen gas. Increasing gas pressure in the repository decreases the rate of brine inflow. Ultimately, the gas pressure may exceed the brine pressure and gas may flow out of the repository. Relative-permeability curves and a correlation between threshold pressure and permeability taken from studies reported in the literature were used in PA models prior to being experimentally verified as appropriate for WIPP. In addition, interbed permeabilities were treated as constant and independent of effective stress in early models. Subsequently, the process of interbed fracturing (or fracture dilation) was recognized to limit gas pressures in the repository to values below lithostatic, and assumed (and unverified) relationships between porosity, permeability, and pore pressure were employed. Parameter-sensitivity studies performed using the simplified models identified important parameters for which site-specific data were needed. Unrealistic modeling results, such as room pressures substantially above lithostatic, showed the need to include additional processes in the models. Field and laboratory experimental programs have been initiated in conjunction with continued model development to provide information on important processes and parameters.

9474 (SAND–94-0786) **Feasibility of permeation grouting for constructing subsurface barriers.** Dwyer, B.P. Sandia National Labs., Albuquerque, NM (United States). Apr 1994. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95005407. Source: OSTI; NTIS; INIS; GPO Dep.

Efforts are being made to devise technologies that provide interim containment of waste sites while final remediation alternatives are developed. Permeation grouting, a technique used extensively in the civil and mining engineering industry has been investigated as a method for emplacing a subsurface containment barrier beneath existing waste sites. Conceptually an underlying barrier is placed by injecting grout into the formation at less than fracturing pressure from a series of directionally drilled boreholes beneath the waste site. This study evaluated the penetration and performance characteristics in varying soil conditions of four different grout materials (two microfine cements, mineral wax, and sodium silicate) at a field scale. Field testing consisted of grout injection via sleeve (tube-a'-manchette) pipe into both vertical and horizontal borehole configurations at the Mixed Waste Landfill Integrated Demonstration site at Sandia National Laboratories. Prior to, during, and after grout injection non-intrusive geophysical techniques were used to map grout flow. Following the tests, the site was excavated to reveal details of the grout permeation, and grouted soil samples were cored for laboratory characterization. The non-intrusive and intrusive grout mapping showed preferential flow patterns, i.e., the grout tended to follow the path of least resistance. Preliminary testing indicates that permeation grouting is a feasible method for emplacing a low permeability subsurface barrier in the semi-arid unconsolidated alluvial soils common to the Southwest. Despite the success of this project, difficulties in predicting grout flow in heterogeneous soils and non-intrusive methods for imaging grout location and continuity are issues that need more attention.

9475 (SAND–94-0858C) **Economic justification of robotic systems using graphical simulation as a tool.** Bennett, P.C. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950232–14: 6. American Nuclear Society meeting on robotics and remote systems, Monterey, CA (United States), 5-10 Feb 1995). Order Number DE95005460. Source: OSTI; NTIS; INIS; GPO Dep.

This paper outlines the simulation and analysis approach taken to address radiation dose reduction using robotic automation from the operational and economic standpoints for the DOE Civilian Radioactive Waste Management system and for the transuranic wave loading facilities within the DOE complex. Simulations of the robotic operations using validated software are described. These simulations provide through-put, capital and operating costs for an economic benefit-cost analysis. Benefit-cost analysis results are also presented.

9476 (SAND–94-2564C) **DOE's performance evaluation project for mixed low-level waste disposal.** Waters, R.D. (Sandia National Labs., Albuquerque, NM (United States)); Chu, M.S.Y.; Gruebel, M.M.; Lee, D.W. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950216–20: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95006823. Source: OSTI; NTIS; INIS; GPO Dep.

A performance evaluation (PE) is an analysis that estimates radionuclide concentration limits for 16 potential Department of Energy (DOE) mixed low-level waste (ULLW) disposal sites based on the analysis of two environmental exposure pathways (air and water) to an off-site individual and an inadvertent-intruder exposure pathway. Sites are analyzed for their ability to attenuate concentrations of specific radionuclides that could be released from wastes in a hypothetical ULLW disposal facility. Site-specific data and knowledge are used within a generic framework that is consistent across all sites being evaluated. After estimates of waste concentrations for the three pathways are calculated, the minimum of the waste concentration values is selected as the permissible waste concentration for each radionuclide. The PE results will be used as input to the process for DOE's ULLW disposal configuration. Preliminary comparisons of results from the PE and site-specific performance assessments indicate that the simple PE results generally agree with results of the performance assessments, even when site conditions are complex. This agreement with performance-assessment results increases confidence that similar results can be obtained at other sites that have good characterization data. In addition, the simple analyses contained in the PE illustrate a potential method to satisfy the needs of many regulators and the general public for a simple, conservative, defensible, and easily understandable analysis that provides results similar to those of more complex analyses.

9477 (SAND–94-2683C) **Reliability assessment of underground shaft closure.** Fossum, A.F. (RE/SPEC, Inc., Rapid City, SD (United States)); Munson, D.E. Sandia National Labs., Albuquerque, NM (United States). [1994]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505115–2: ASCE engineering mechanics conference, Boulder, CO (United States), 21-24 May 1995). Order Number DE95004526. Source: OSTI; NTIS; INIS; GPO Dep.

The intent of the WIPP, being constructed in the bedded geologic salt deposits of Southeastern New Mexico, is to provide the technological basis for the safe disposal of radioactive Transuranic (TRU) wastes generated by the defense programs of the United States. In determining this technological basis, advanced reliability and structural analysis techniques are used to determine the probability of time-to-closure of a hypothetical underground shaft located in an argillaceous salt formation and filled with compacted crushed salt. Before being filled with crushed salt for sealing, the shaft provides access to an underground facility. Reliable closure of the shaft depends upon the sealing of the shaft through creep closure and recompaction of crushed backfill. Appropriate methods are demonstrated to calculate cumulative distribution functions of the closure based on laboratory determined random variable uncertainty in salt creep properties.

9478 (SAND–95-0117C) **Recent progress in scenario development for the WIPP.** Galson, D.A. (Galson Sciences Limited, Oakham, Rutland (United Kingdom)); Swift, P.N. Sandia National Labs., Albuquerque, NM (United States). 19 Jan 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950570–5: International high-level radioactive waste management conference: progress toward understanding, Las Vegas, NV (United States), 1-5 May 1995). Order Number DE95006309. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) is preparing to request the US Environmental Protection Agency to certify compliance with the radioactive waste disposal standards found in 40 CFR Part 191 for the Waste Isolation Pilot Plant (WIPP). The DOE will also need to demonstrate compliance with a number of other State and Federal standards and, in particular, the Land Disposal Restrictions of the Resource Conservation and Recovery Act (RCRA), 40 CFR Part 268. Demonstrating compliance with these regulations requires an assessment of the long-term performance of the WIPP disposal system. Re-evaluation and extension of past scenario development for the WIPP forms an integral part of the ongoing performance assessment (PA) process.

9479 (SKB-TR–93-34) **SKB annual report 1993. Including summaries of technical reports issued during 1993.** Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). May 1994. 207p. Order Number DE95620466. Source: OSTI; NTIS; INIS.

This is the annual report on the activities of the Swedish Nuclear and Waste Management Co., SKB. It contains in part I an overview of SKB activities in different fields. Part II gives a description of the research and development work on nuclear waste disposal performed during 1993. Lectures and publications during 1993 as well as reports issued in the SKB technical series are listed in part III. Part IV contains the summaries of all technical reports issued during 1993. SKB is the owner of CLAB, the Central Facility for Interim Storage of Spent Nuclear Fuel, located at Oskarshamn. CLAB was taken into operation in July 1985 and to the end of 1993 in total 1 885 tonnes of spent fuel (measured as uranium) have been received. Transportation from the nuclear sites to CLAB is made by a special ship, M/S Sigyn. At Forsmark the final repository for Radioactive Waste - SFR - was taken into operation in April 1988. The repository is situated in crystalline rock under the Baltic Sea. At the end of 1993 a total of 13 000 m^3 of waste have been deposited in SFR. SKB is in charge of a comprehensive research and development programme on geological disposal of nuclear waste. Some of the main areas for SKB research are: Groundwater movements; Bedrock stability; Groundwater chemistry and nuclide migration; Methods and instruments for in situ characterization of crystalline bedrock; Characterization and leaching of spent nuclear fuel; Properties of bentonite for buffer, backfilling and sealing; Radionuclide transport in biosphere and dose evaluations; Development of performance and safety assessment methodology and assessment models; Construction of an underground research laboratory.

9480 (SSI–94-08) **The content and environmental impact from the waste depository in Sillamaee.** Ehdwall, H. (Swedish Radiation Protection Inst., Stockholm (Sweden)); Sundblad, B.; Nosov, V.; Putnik, H.; Mustonen, R.; Salonen, L.; Qvale, H. Swedish Radiation Protection Inst., Stockholm (Sweden). 22 Aug 1994. 42p. Order Number DE95620467. Source: OSTI; NTIS; INIS.

The studies of the waste depository in Sillamaee, Estonia, shows that the content as well as the wall material is typical tailings from chemical enrichment of uranium ore. The environmental impact from radioactive substances as well as heavy metals has been estimated. Results show the major radiological impact to the population in the Sillamaee town is the exposure to radon and its daughter products emanating from the depository. The impact on the Gulf of Finland is limited to a few hundred metres outside the coast-line. 7 refs, 8 figs, 15 tabs.

9481 (SSI–94-11) **Radioactive waste disposal - Time aspects.** Lindbom, B. (Kemakta Konsult AB, Stockholm (Sweden)); Wiborgh, M.; Molander, P. Swedish Radiation Protection Inst., Stockholm (Sweden). 25 Oct 1994. 71p. (In Swedish). Order Number DE95620468. Source: OSTI; NTIS; INIS.

The report deals with some ethical and juridical questions in connection with the final disposal of radioactive wastes. 20 refs, 16 figs.

9482 (UCRL-ID–108314-Rev.1) **Preliminary waste form characteristics report Version 1.0. Revision 1.** Stout, R.B.; Leider, H.R. (eds.). Lawrence Livermore National Lab., CA (United

States). 11 Oct 1991. 499p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95006371. Source: OSTI; NTIS; INIS; GPO Dep.

This report focuses on radioactive waste form characteristics that will be used to design a waste package and an engineered barrier system (EBS) for a suitable repository as part of the Yucca Mountain Project. The term waste form refers to irradiated reactor fuel, other high-level waste (HLW) in various physical forms, and other radioactive materials (other than HLW) which are received for emplacement in a geologic repository. Any encapsulating of stabilizing matrix is also referred to as a waste form.

9483 (UCRL-ID–118122) **ASPEN computer simulations of the mixed waste treatment project baseline flowsheet.** Dietsche, L.J.; Upadhye, R.S.; Camp, D.W.; Pendergrass, J.A.; Borduin, L.C.; Thompson, T.K. Lawrence Livermore National Lab., CA (United States). 5 Jul 1994. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95006442. Source: OSTI; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020 (United States); INIS; GPO Dep.

The treatment and disposal of mixed waste (i.e., waste containing both hazardous and radioactive components) is a challenging waste- management problem of particular concern to Department of Energy (DOE) sites throughout the United States. Traditional technologies used for destroying hazardous wastes must be re-evaluated for their ability to handle mixed wastes, and, in some cases, new technologies must be developed. The Mixed Waste Treatment Project (MWTP), a collaborative effort between Lawrence Livermore National Laboratory (LLNL), Los Alamos National Laboratory, and Pacific Northwest Laboratory (PNL), was established by the DOE's Waste Operations Program (EM-30) to develop and analyze alternative mixed waste treatment approaches. One of the MWTP's initiatives, and the objective of this study, was to develop flowsheets for prototype, integrated, mixed-waste treatment facilities that can serve as models for sites developing their own treatment strategies. Evaluation of these flowsheets is being facilitated through the use of computer modeling. The objectives of the flowsheet simulations are to compare process effectiveness and costs of alternative flowsheets and to determine if commercial process-simulation software could be used on the large, complex process of an integrated mixed waste processing facility. Flowsheet modeling is needed to evaluate many aspects of proposed flowsheet designs. A major advantage of modeling the complete flowsheet is the ability to define the internal recycle streams, thereby making it possible to evaluate the impact of one operation on the whole plant. Many effects that can be seen only in this way. Modeling also can be used to evaluate sensitivity and range of operating conditions, radioactive criticality, and relative costs of different flowsheet designs. Further, the modeled flowsheets must be easily modified so that one can examine how alternative technologies and varying feed streams affect the overall integrated process.

9484 (UCRL-JC–115341) **Geomechanics investigations in support of the large block test at Fran Ridge, Nye County, Nevada.** Blair, S.C.; Berge, P.; Kansa, E.; Lin, Wunan; Roberts, J. Lawrence Livermore National Lab., CA (United States). 21 Jul 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950435–1: 2. international conference on mechanics of jointed and faulted rock, Vienna (Austria), 10-14 Apr 1995). Order Number DE94017413. Source: OSTI; NTIS; INIS; GPO Dep.

The Yucca Mountain Site Characterization Project is investigating the Topopah Spring Tuff at Yucca Mountain, Nevada for its suitability as a host rock for the disposal of high level nuclear wastes. The Lawrence Livermore National Laboratory is planning a large block test (LBT) to investigate coupled thermal-mechanical-hydrological and geochemical processes that may occur in the repository near-field environment.

9485 (UCRL-JC–116429) **The importance of thermal loading conditions to waste package performance at Yucca Mountain.** Buscheck, T.A.; Nitao, J.J. Lawrence Livermore National Lab., CA (United States). Oct 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941075–7: 18. international symposium on the scientific basis for nuclear waste management, Kyoto (Japan), 23-27 Oct 1994). Order Number DE95006440. Source: OSTI; NTIS; INIS; GPO Dep.

Temperature and relative humidity are primary environmental factors affecting waste package corrosion rates for the potential repository in the unsaturated zone at Yucca Mountain, Nevada. Under ambient conditions, the repository environment is quite humid. If relative humidity is low enough (<70%), corrosion will be minimal. Under humid conditions, corrosion is reduced if the temperature is low (<60 C). Using the V-TOUGH code, the authors model thermo-hydrological flow to investigate the effect of repository heat on temperature and relative humidity in the repository for a wide range of thermal loads. These calculations indicate that repository heat may substantially reduce relative humidity on the waste package, over hundreds of years for low thermal loads and over tens of thousands of year for high thermal loads. Temperatures associated with a given relative humidity decrease with increasing thermal load. Thermal load distributions can be optimized to yield a more uniform reduction in relative humidity during the boiling period.

9486 (UCRL-JC–118689) **Integrated Corrosion Facility for long-term testing of candidate materials for high-level radioactive waste containment.** Estill, J.C.; Dalder, E.N.C.; Gdowski, G.E.; McCright, R.D. Lawrence Livermore National Lab., CA (United States). Oct 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950570–3: International high-level radioactive waste management conference: progress toward understanding, Las Vegas, NV (United States), 1-5 May 1995). Order Number DE95005921. Source: OSTI; NTIS; INIS; GPO Dep.

A long-term-testing facility, the Integrated Corrosion Facility (I.C.F.), is being developed to investigate the corrosion behavior of candidate construction materials for high-level-radioactive waste packages for the potential repository at Yucca Mountain, Nevada. Corrosion phenomena will be characterized in environments considered possible under various scenarios of water contact with the waste packages. The testing of the materials will be conducted both in the liquid and high humidity vapor phases at 60 and 90°C. Three classes of materials with different degrees of corrosion resistance will be investigated in order to encompass the various design configurations of waste packages. The facility is expected to be in operation for a minimum of five years, and operation could be extended to longer times if warranted. A sufficient number of specimens will be emplaced in the test environments so that some can be removed and characterized periodically. The corrosion phenomena to be characterized are general, localized, galvanic, and stress corrosion cracking. The long-term data obtained from this study will be used in corrosion mechanism modeling, performance assessment, and waste package design. Three classes of materials are under consideration. The corrosion resistant materials are high-nickel alloys and titanium alloys; the corrosion allowance materials are low-alloy and carbon steels; and the intermediate corrosion resistant materials are copper-nickel alloys.

9487 (UCRL-JC–119118) **Aqueous dissolution rates of uranium oxides.** Steward, S.A.; Mones, E.T. Lawrence Livermore National Lab., CA (United States). Oct 1994. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950570–4: International high-level radioactive waste management conference: progress toward understanding, Las Vegas, NV (United States), 1-5 May 1995). Order Number DE95005920. Source: OSTI; NTIS; INIS; GPO Dep.

An understanding of the long-term dissolution of waste forms in groundwater is required for the safe disposal of high level nuclear waste in an underground repository. The main routes by which radionuclides could be released from a geological repository are the dissolution and transport processes in groundwater flow. Because uranium dioxide is the primary constituent of spent nuclear fuel, the dissolution of its matrix in spent fuel is considered the rate-limiting step for release of radioactive fission products. The purpose of our work has been to measure the intrinsic dissolution rates of uranium oxides under a variety of well-controlled conditions that are relevant to a repository and allow for modeling. The intermediate oxide

phase U_3O_8, triuranium octaoxide, is quite stable and known to be present in oxidized spent fuel. The trioxide, UO_3, has been shown to exist in drip tests on spent fuel. Here we compare the results of essentially identical dissolution experiments performed on depleted U_3O_8 and dehyrated schoepite or uranium trioxide monohydrate ($UO_3 \cdot H_2O$). These are compared with earlier work on spent fuel and UO_2 under similar conditions.

9488 (UCRL-JC–119119) **Effect of areal power density and relative humidity on corrosion resistant container performance.** Gansemer, J.D. Lawrence Livermore National Lab., CA (United States). Oct 1994. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950570–9: International high-level radioactive waste management conference: progress toward understanding, Las Vegas, NV (United States), 1-5 May 1995). Order Number DE95006433. Source: OSTI; NTIS; INIS; GPO Dep.

The impact of the rewetting process on the performance of waste containers at the Yucca Mountain repository is analyzed. This paper explores the impact of the temperature-humidity relationships on pitting corrosion failure of stainless steel containers for different areal power densities (APDs)in the repository. It compares the likely performance of containers in a repository with a low APD, 55 Kw/acre, and a high APD, 110 kW/acre.

9489 (UCRL-JC–119131) **Synthesis of tobermorite: A cement phase expected under repository conditions.** Martin, S.I. Lawrence Livermore National Lab., CA (United States). Nov 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950570–2: International high-level radioactive waste management conference: progress toward understanding, Las Vegas, NV (United States), 1-5 May 1995). Order Number DE95005917. Source: OSTI; NTIS; INIS; GPO Dep.

In this study I have synthesized tobermorite, $Ca_5Si_6O_{16}(OH)_2.4H_20$, a principal crystalline phase expected to form in cementitious materials subjected to elevated temperatures in a potential nuclear waste repository. Fluids interacting with these materials may have a profound effect on the integrity of the waste package and on transport of radionuclides. At ambient temperature, Portland cement reacts with water to form an amorphous calcium-silicate-hydrate (C-S-H) gel. At elevated temperatures, crystalline phases of various hydration states form. The C-S-H system has not been well characterized at elevated temperatures up to 250°C, which has been considered a bounding temperature for the potential Yucca Mountain repository. Physical, chemical, and thermodynamic data for these cement minerals that are predicted to be stable at these temperatures must be obtained from synthetic or natural samples to help predict fluid chemistry. For some of these minerals natural samples are difficult to obtain in sufficient quantity and purity. Therefore, monomineralic phases must be synthesized in order to unambiguously define their behavior. The synthetic or natural phases will be characterized as part of a comprehensive study to define the behavior of cementitious materials in a repository environment.

9490 (UCRL-JC–119209) **Creep strains predicted from constitutive equations for Zircaloy-clad spent fuel rods.** Rosen, R.S.; O'Connell, W.J. Lawrence Livermore National Lab., CA (United States). Nov 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950570–6: International high-level radioactive waste management conference: progress toward understanding, Las Vegas, NV (United States), 1-5 May 1995). Order Number DE95006804. Source: OSTI; NTIS; INIS; GPO Dep.

Integrity of a high percentage of the Zircaloy (zirconium-alloy) clad spent fuel rods during extended dry storage is a design consideration of the storage system. Maintaining cladding integrity after permanent disposal placement may also be desired, although other barriers will be engineered to contain the radioactive waste. The limits to the temperatures the Zircaloy tubes can sustain over extended times are principally determined by creep at stresses (from internal gas pressure) and temperatures relevant to dry storage conditions. Excessive creep may lead to an eventual ductile fracture crack. The thermal design criteria assure compatibility of the heat load, the heat transfer properties, and the materials response. Therefore, the ability to predict the long-term integrity of Zircaloy is important to the design requirements. To do this reliably requires both a theoretical and empirical description of creep deformation and fracture.

9491 (USGS-OFR–93-477) **Lithology, fault displacement, and origin of secondary calcium carbonate and opaline silica at Trenches 14 and 14D on the Bow Ridge Fault at Exile Hill, Nye County, Nevada.** Taylor, E.M.; Huckins, H.E. Colorado Geological Survey, Denver, CO (United States). 1995. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI08-78ET44802. Order Number DE95006158. Source: OSTI; NTIS; INIS; GPO Dep.

Yucca Mountain, a proposed site for a high-level nuclear-waste repository, is located in southern Nevada, 20 km east of Beatty, and adjacent to the southwest corner of the Nevada Test Site (NTS) (fig. 1). Yucca Mountain is located within the Basin and Range province of the western United States. The climate is semiarid, and the flora is transitional between that of the Mojave Desert to the south and the Great Basin Desert to the north. As part of the evaluation, hydrologic conditions, especially water levels, of Yucca Mountain and vicinity during the Quaternary, and especially the past 20,000 years, are being characterized. In 1982, the US Geological Survey, in cooperation with the US Department of Energy (under interagency agreement DE-A104-78ET44802), excavated twenty-six bulldozer and backhoe trenches in the Yucca Mountain region to evaluate the nature and frequency of Quaternary faulting (Swadley and others, 1984). The trenches were oriented perpendicular to traces of suspected Quaternary faults and across projections of known bedrock faults into Quaternary deposits. Trench 14 exposes the Bow Ridge Fault on the west side of Exile Hill. Although the original purpose of the excavation of trench 14 was to evaluate the nature and frequency of Quaternary faulting on the Bow Ridge Fault, concern arose as to whether or not the nearly vertical calcium carbonate (the term "carbonate" in this study refers to calcium carbonate) and opaline silica veins in the fault zone were deposited by ascending waters (ground water). These veins resemble in gross morphology veins commonly formed by hydrothermal processes.

9492 (USGS-OFR–94-305) **Hydrochemical data base for the Death Valley Region, California and Nevada.** Perfect, D.L.; Faunt, C.C.; Steinkampf, W.C.; Turner, A.K. Geological Survey, Denver, CO (United States). 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI08-92NV10874. Order Number DE95006175. Source: OSTI; NTIS; INIS; U.S. Geological Survey, Earth Science Information Center, Open-File Reports Section, Box 25286, MS 517, Denver Federal Center, Denver, CO 80225 (United States); GPO Dep.

Report includes 2 diskettes designed to run on IBM PC or compatible equipment.

Ground-water chemistry data derived from samples collected within an approximately 100,000-square-kilometer area in the Southern Great Basin have been compiled into a digital data base. The data were compiled from published reports, the U.S. Geological Survey (USGS) National Water Information System (NWIS), and previously unpublished USGS files. The data are contained in two compressed files which self-expand into Lotus (.WK1) files. The first file contains 4,738 records (4.84 megabytes) and represents the basic compilation of all identified analyses. The second file is an edited version of the first and contains 3,733 records (3.84 megabytes). Editing included the removal of duplicate records and the combining of records, when appropriate. The analyses presented are of variable quality and comprehensiveness and include no isotopic data. Of the 3,733 analyses in the edited data base, 58 percent of the major ion concentrations balance to within ±10 percent. Most of the remaining records are not sufficiently complete for a balance to be calculated.

9493 (USGS/WRI–93-4000) **Revised potentiometric-surface map, Yucca Mountain and vicinity, Nevada.** Ervin, E.M.; Luckey, R.R.; Burkhardt, D.J. Geological Survey, Denver, CO (United States). 1994. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI08-92NV10874. Order Number DE95003786. Source: OSTI; NTIS; INIS; U.S. Geological

Survey, Earth Science Information Center, Open-File Reports Section, Box 25286, MS 517, Denver Federal Center, Denver, CO 80225; GPO Dep.

The revised potentiometric-surface map presented in this report updates earlier maps of the Yucca Mountain area using mainly 1988 average water levels. Because of refinements in the corrections to the water-level measurements, these water levels have increased accuracy and precision over older values. The small-gradient area to the southeast of Yucca Mountain is contoured with a 0.25-meter interval and ranges in water-level altitude from 728.5 to 73 1.0 meters. Other areas with different water levels, to the north and west of Yucca Mountain, are illustrated with shaded patterns. The potentiometric surface can be divided into three regions: (1) A small-gradient area to the southeast of Yucca Mountain, which may be explained by flow through high-transmissivity rocks or low ground-water flux through the area; (2) A moderate-gradient area, on the western side of Yucca Mountain, where the water-level altitude ranges from 775 to 780 meters, and appears to be impeded by the Solitario Canyon Fault and a splay of that fault; and (3) A large-gradient area, to the north-northeast of Yucca Mountain, where water level altitude ranges from 738 to 1,035 meters, possibly as a result of a semi-perched groundwater system. Water levels from wells at Yucca Mountain were examined for yearly trends using linear least-squares regression. Data from five wells exhibited trends which were statistically significant, but some of those may be a result of slow equilibration of the water level from drilling in less permeable rocks. Adjustments for temperature and density changes in the deep wells with long fluid columns were attempted, but some of the adjusted data did not fit the surrounding data and, thus, were not used.

9494 (USGS/WRI–93-4025) **Precision and accuracy of manual water-level measurements taken in the Yucca Mountain Area, Nye County, Nevada, 1988–90.** Boucher, M.S. Geological Survey, Denver, CO (United States). 1994. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI08-92NV10874. Order Number DE95003787. Source: OSTI; NTIS; U.S. Geological Survey, Earth Science Information Center, Open-File Reports Section, Box 25286, MS 517, Denver Federal Center, Denver, CO 80225 (United States); GPO Dep.

Water-level measurements have been made in deep boreholes in the Yucca Mountain area, Nye County, Nevada, since 1983 in support of the US Department of Energy's Yucca Mountain Project, which is an evaluation of the area to determine its suitability as a potential storage area for high-level nuclear waste. Water-level measurements were taken either manually, using various water-level measuring equipment such as steel tapes, or they were taken continuously, using automated data recorders and pressure transducers. This report presents precision range and accuracy data established for manual water-level measurements taken in the Yucca Mountain area, 1988-1990. Precision and accuracy ranges were determined for all phases of the water-level measuring process, and overall accuracy ranges are presented.

9495 (UTNL-R–0312) **Report on 'basic science on treatment and disposal of radioactive waste (4)' of Yayoi Research Group.** Tokyo Univ., Tokai, Ibaraki (Japan). Nuclear Engineering Research Lab. 1994. 61p. (In Japanese). (CONF-9403202–: Yayoi study meeting 'basic science on treatment and disposal of radioactive waste (4)', Tokai (Japan), 18 Mar 1994). Order Number DE95747976. Source: OSTI; NTIS; INIS.

This report is the copy of the OHP presented at the Yayoi study meeting 'Basic science on treatment and disposal of radioactive waste (4)' held on March 18, 1994 sponsored by Nuclear Engineering Research Laboratory, Faculty of Engineering, University of Tokyo. In the meeting of this year, concentrated discussion was carried out by focusing on colloid. Lectures were given at the meeting on the present status of the research on colloid in Migration '93 and the positioning of colloid in waste disposal, the flocculation and dispersion properties of colloid particles in flow fields, the research by the theory of rate process using colors on the crystallization of siderophile-as the media for fixing lanthanoid and actinoid, and the effect of pseudo-colloid formation exerted on nuclide movement and the diffusion of charged particles. The list of 50 participants is attached. (K.I.).

9496 (WHC-EP–0468-3) **Facility effluent monitoring plan for the plutonium uranium extraction facility.** Wiegand, D.L. Westinghouse Hanford Co., Richland, WA (United States). Sep 1994. 346p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95001031. Source: OSTI; NTIS; INIS; GPO Dep.

A facility effluent monitoring plan is required by the US Department of Energy in DOE Order 5400.1 for any operations that involve hazardous materials and radioactive substances that could impact employee or public safety or the environment. This document is prepared using the specific guidelines identified in A Guide for Preparing Hanford Site Facility Effluent Monitoring Plans, WHC-EP-0438-01. This facility effluent monitoring plan assesses effluent monitoring systems and evaluates whether they are adequate to ensure the public health and safety as specified in applicable federal, state, and local requirements. This facility effluent monitoring plan shall ensure long-range integrity of the effluent monitoring systems by requiring an update whenever a new process or operation introduces new hazardous materials or significant radioactive materials. This document must be reviewed annually even if there are no operational changes, and it must be updated at a minimum of every three years.

9497 (WHC-EP–0750-Vol.1-Rev.1) **High-level waste storage tank farms/242-A evaporator Standards/Requirements Identification Document (S/RID), Volume 1.** Westinghouse Hanford Co., Richland, WA (United States). Apr 1994. 197p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95007478. Source: OSTI; NTIS; INIS; GPO Dep.

The High-Level Waste Storage Tank Farms/242-A Evaporator Standards/Requirements Identification Document (S/RID) is contained in multiple volumes. This document (Volume 1) presents the standards and requirements for the Management Systems and the Configuration Management sections.

Source: OSTI; NTIS; INIS; GPO Dep.

The High-Level Waste Storage Tank Farms/242-A Evaporator Standards/Requirements Identification Document (S/RID) is contained in multiple volumes. This document (Volume 7) presents the standards and requirements for the following sections: Occupational Safety and Health, and Environmental Protection.

9504 (WHC-EP–0834) **Subsurface barrier feasibility evaluation: External review meeting report.** Lindberg, S.L. (Bovay Northwest, Inc., Richland, WA (United States)); Rouse, J.K. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004975. Source: OSTI; NTIS; INIS; GPO Dep.

The Westinghouse Hanford Company – Tank Waste Remediation System Division (TWRS) Program is evaluating subsurface barrier technologies for potential use in supporting remediation of the Hanford Tank Farms for the US Department of Energy, Richland Operations Office (DOE-RL). An External Review Team (ERT) was assembled to perform an independent technical review of the work performed to-date supporting the evaluation process. A set of draft documents was forwarded to the ERT for their review, and a meeting was held August 10 through 12, 1994, to facilitate comments and resolutions. This document summarizes the meeting, the comments provided by the ERT, and the ongoing work to resolve the comments and support a pending decision by The US Department of Energy, Richland Operations Office; the Washington State Department of Ecology; and the US Environmental Protection Agency.

9505 (WHC-MR–0483) **TBP and diluent mass balances in the PUREX Plant at Hanford, 1955–1991.** Sederburg, J.P. (Westinghouse Hanford Co., Richland, WA (United States)); Reddick, J.A. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004980. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to develop an estimate of the quantities of tributyl phosphate and diluent discharged in aqueous waste streams to the tank farms from the Hanford Purex Plant over its operating life. Purex was not the sole source of organics in the tank farms, but was a major contributor. Tributyl phosphate (TBP) and diluent, which changed from Shell E-2342® to Soltrol-170® and then to normal paraffin hydrocarbon (NPH), were organic chemicals used in the Purex solvent extraction process at Hanford to separate plutonium and uranium from spent nuclear fuels. This report is an estimate of the material balances for these chemicals in the Purex Plant at Hanford over its entire operating life. The Purex Plant had cold start up in November 1955 and shut down in 1990. It's process used a solution of 30 vol% TBP in diluent.

9506 (WHC-SA–1196-Rev.1) **Application of a CdTe gamma-ray spectrometer to remote characterization of high-level radioactive waste tanks.** Addleman, R.S.; Blewett, G.R.; Keele, B.D.; McClellan, C.S.; Subrahmanyam, V.B.; Troyer, G.L. Westinghouse Hanford Co., Richland, WA (United States). Apr 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95007560. Source: OSTI; NTIS; INIS; GPO Dep.

Small, shielded cadmium telluride (CdTe) semiconductor gamma-ray detectors have been used for in situ radiological characterization of underground high-level radioactive waste tanks. Remote measurements have been made in gamma radiation fields up to 700 R/h. Spectral data have been used to generate qualitative and quantitative radionuclide profiles of high-level radioactive waste tanks. Two electronic spectral enhancement techniques (pulse risetime discrimination and pulse risetime compensation) have been used in order to measure trace isotopes with photopeak energies greater than 662keV in the presence of large amounts of ^{137}Cs. Spectral resolution of 1.5% for the ^{137}Cs 662 keV photopeak has been obtained.

9507 (WHC-SA–2449) **Retrieval of underground storage tank wastes: The Hanford challenge.** Shen, E.J. Westinghouse Hanford Co., Richland, WA (United States). Oct 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950232–13: 6. American Nuclear Society meeting on robotics and remote systems, Monterey, CA (United States), 5-10 Feb 1995). Order Number DE95003046. Source: OSTI; NTIS; GPO Dep.

Approximately 140,000 m^3 (37 Mgal) of waste material now resides in 149 SSTs single-shell tanks. These tanks are of an early design that consists of a carbon-steel liner surrounded by a reinforced structural concrete shell. Originally designed for a 20-year life, the first of those constructed are surpassing that expectation. Many have lost confinement integrity, and leaks to the environment have been detected. These wastes present a significant recovery challenge. The goal is to develop and field retrieval systems with the capability to remove wastes from these tanks and transfer those wastes for further downstream processing. The application of existing technologies has been the foundation of the retrieval strategy. However the aggressive schedules and complexity of the wastes to be recovered have required the search for and the development of more advanced technologies. This paper discusses the long-term strategy that has been developed to support the waste retrieval efforts of the Tank Waste Remediation System program.

9508 (WHC-SA–2540) **Material selection for Multi-Function Waste Tank Facility tanks.** Larrick, A.P. (Westinghouse Hanford Co., Richland, WA (United States)); Blackburn, L.D.; Brehm, W.F.; Carlos, W.C.; Hauptmann, J.P.; Danielson, M.J.; Westerman, R.E.; Divine, J.R.; Foster, G.M. Westinghouse Hanford Co., Richland, WA (United States). Mar 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950304–10: Corrosion '95: National Association of Corrosion Engineers (NACE) international annual conference and corrosion show, Orlando, FL (United States), 26-31 Mar 1995). Order Number DE95005139. Source: OSTI; NTIS; GPO Dep.

This paper briefly summarizes the history of the materials selection for the US Department of Energy's high-level waste carbon steel storage tanks. It also provides an evaluation of the materials for the construction of new tanks at the evaluation of the materials for the construction of new tanks at the Multi-Function Waste Tank Facility. The evaluation included a materials matrix that summarized the critical design, fabrication, construction, and corrosion resistance requirements: assessed. each requirement: and cataloged the advantages and disadvantages of each material. This evaluation is based on the mission of the Multi-Function Waste Tank Facility. On the basis of the compositions of the wastes stored in Hanford waste tanks, it is recommended that tanks for

the Multi-Function Waste Tank Facility be constructed of ASME SA 515, Grade 70, carbon steel.

9509 (WHC-SA–2544) **Hanford double shell tank corrosion monitoring instrument trees.** Nelson, J.L. Westinghouse Hanford Co., Richland, WA (United States). Mar 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950304–11: Corrosion '95: National Association of Corrosion Engineers (NACE) international annual conference and corrosion show, Orlando, FL (United States), 26-31 Mar 1995). Order Number DE95005161. Source: OSTI; NTIS; INIS; GPO Dep.

High-level nuclear wastes at the Hanford site are stored underground in carbon steel double-shell and single-shell tanks - (DSTs and SSTS). Westinghouse Hanford Company is considering installation of a prototype corrosion monitoring instrument tree in at least one DST in the summer of 1995. The instrument tree will have the ability to detect and discriminate between uniform corrosion, stress corrosion cracking (SCC), and pitting. Additional instrument trees will follow in later years. Proof-of-technology testing is currently underway for the use of commercially available electric field pattern (EFP) analysis and electrochemical noise (EN) corrosion monitoring equipment. Creative use and combinations of other existing technologies is also being considered. Successful demonstration of these technologies will be followed by the development of a Hanford specific instrument tree. The first instrument tree will incorporate one of these technologies. Subsequent trees may include both technologies, as well as a more standard assembly of corrosion coupons. Successful development of these trees will allow their application to single shell tanks and the transfer of technology to other U.S. Department of Energy (DOE) sites.

9510 (WHC-SA–2563) **Generation and release of flammable gases in Hanford tanks: An overview.** Johnson, G.D.; McDuffie, N.G. Westinghouse Hanford Co., Richland, WA (United States). Aug 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-940813–26: 208. American Chemical Society national meeting, Washington, DC (United States), 21-26 Aug 1994). Order Number DE95000997. Source: OSTI; NTIS; INIS; GPO Dep.

Twenty-five of the 177 high-level waste tanks at the Hanford Site have been identified as having the potential to generate and release flammable gases. This issue was declared an unreviewed safety question (USQ) in early 1990. Designation of the USQ in accordance with the United States Department of Energy (DOE) orders initiated a series of actions that will culminate in an updated safety analysis report (SAR) and new operating restrictions. At the time the USQ was declared, interim operational safety requirements were established to restrict activities in the dome spaces, ventilation systems, peripheral equipment, and operations associated with the waste in these tanks. Most important, steps were taken to eliminate potential ignition sources; these included shutting down certain equipment, using electrical bonding and grounding techniques, and using non-sparking tools.

9511 (WHC-SA–2565) **The solubilities of significant organic compounds in HLW tank supernate solutions.** Barney, G.S. Westinghouse Hanford Co., Richland, WA (United States). Aug 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-940813–32: 208. American Chemical Society national meeting, Washington, DC (United States), 21-26 Aug 1994). Order Number DE95004163. Source: OSTI; NTIS; INIS; GPO Dep.

Large quantities of organic chemicals used in reprocessing spent nuclear-fuels at the Hanford Site have accumulated in underground high-level radioactive waste tanks. The organic content of these tanks must he known so that the potential for hazardous reactions between organic components and sodium nitrate/nitrite salts in the waste can he evaluated. The solubilities of organic compounds described in this report will help determine if they are present in the solid phases (salt cake and sludges) as well as the liquid phase (interstitial liquor/supernate) in the tanks. The solubilities of five significant sodium salts of carboxylic acids and aminocarboxylic acids [sodium oxalate, formate, citrate, nitrilotriacetate (NTA) and ethylendiaminetetraacetate (EDTA)] were measured in a simulated supernate solution at 25°C, 30°C, 40°C, and 50°C.

9512 (WHC-SA–2618) **Effectiveness of an effluent retention pond cover to reduce atmospheric source terms.** Roblyer, S.P. (Westinghouse Hanford Co., Richland, WA (United States)); Watson, W.T.; Toffer, H.; Owczarski, P.C. Westinghouse Hanford Co., Richland, WA (United States). Sep 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950420–10: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 may 1995). Order Number DE95002467. Source: OSTI; NTIS; INIS; GPO Dep.

The AIRSOURC code calculates the atmospheric source terms of elements, organics, and radionuclides with mathematical models that describe typical facilities in the waste treatment effluent streams. A model of volatile material mass transfer from an uncovered and covered effluent retention basin surface is discussed in this paper. This model can be easily extended to new materials, primarily organic; to extensive US Environmental Protection Agency data libraries; or other sources. The model was used to justify and defend a cover design for large effluent retention basins. The covers were shown to very effectively reduce the release of atmospheric source terms from the retention basins.

9513 (WHC-SA–2666) **G3 model of gas and liquid migration from grout containing radioactive waste.** Roblyer, S.P.; Finfrock, S.H.; Powell, W.J. Westinghouse Hanford Co., Richland, WA (United States). Nov 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950420–12: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 may 1995). Order Number DE95004511. Source: OSTI; NTIS; INIS; GPO Dep.

Grout has been evaluated as a means of containing low-level radioactive waste for long-term disposal. Concerns about hydrogen and reactive gas generation in the Hanford Site grout disposal facility lead to the development of the G3 model, which has predicted buildup of radiolytically formed gases in the grout region and their migration to air-filled regions. The G3 model is a one-dimensional code that couples models of gas diffusion with two-phase gas and liquid flow. It was coupled to a compartment diffusion model and these models predicted the concentrations of hydrogen I nitrous oxide, and other gases in air-filled regions of the grout disposal facility. The results have served as the technical basis for safety studies. A unique finding of the G3 model was that a liquid return, or expulsion of unbound liquid from the grout region, could occur. This liquid return is driven by displacement caused by gas bubbles that form within the grout's microstructure. Liquid return is very sensitive to the level of gas production, the geometry and design of the grout region, and the material properties of the grout. Experimental evidence and observations that support code predictions will be discussed in this paper.

9514 (WHC-SA–2690) **Corrosion control of the Hanford Site waste transfer system.** Haberman, J.H. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950304–7: Corrosion '95: National Association of Corrosion Engineers (NACE) international annual conference and corrosion show, Orlando, FL (United States), 26-31 Mar 1995). Order Number DE95003945. Source: OSTI; NTIS; GPO Dep.

Corrosion control of the Hanford Site waste transfer system is necessary to assure the system is operational for planned activities leading to successful environmental restoration. Cathodic protection of the Hanford Site waste transfer system has been in existence since the 1940's with acceptable results. The original system was updated with an improved modern design. Energization surveys and a recent baseline survey demonstrate that the existing system operates as intended.

9515 (WHC-SA–2705) **Telepresence and virtual environment applications on the light duty utility arm system.** Pardini, A.F. (Westinghouse Hanford Co., Richland, WA (United States)); Rod, S.R. Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950232–15: 6. American Nuclear Society meeting on robotics and remote

systems, Monterey, CA (United States), 5-10 Feb 1995). Order Number DE95006836. Source: OSTI; NTIS; INIS; GPO Dep.

The Tri-Party Agreement was initiated in 1989 to provide a thirty-year clean-up plan for the United States Department of Energy's (DOE) Hanford Site. This plan addresses the remediation of hazardous chemical and radioactive wastes with a major emphasis on the characterization of Hanford's underground waste storage tanks. To assist in this task the DOE is funding the development of a light duty robotic arm capable of deploying various tools which can inspect and characterize the interior of DOE waste tanks. Current development includes two new technologies – stereoscopic telepresence, which will allow three-dimensional viewing of the waste tank interior; and "virtual environments" (or "virtual reality"), which will provide computer-simulated world wherein operators can practice inspections and other activities prior to performing actual operations in real waste tanks.

9516 (WHC-SA–2707) **Description of the solid waste container corrosion program at the Hanford Site.** Duncan, D.R. Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950304–12: Corrosion '95: National Association of Corrosion Engineers (NACE) international annual conference and corrosion show, Orlando, FL (United States), 26-31 Mar 1995). Order Number DE95005478. Source: OSTI; NTIS; INIS; GPO Dep.

Waste management and environmental restoration are the Prime missions of the Hanford site, owned by the Department of Energy and operated by a management and operations contractor. The Site is located in southeast Washington State; its focus since World War II was the production of nuclear material to be used in atomic weapons but now is environmental cleanup. The cleanup of the site presents formidable challenges. The degradation of containers used to store radioactive and hazardous waste presents one of these challenges. Such containers, primarily 55 gallon (208 liter) drums, have been stored for eventual retrieval and re-packing for final disposal, some since 1970, in various types of environments. The expected degradation during storage must be estimated, verified, and predicted to allow prudent waste storage. several programs have been put into place at the Hanford Site to facilitate corrosion measurement and prediction.

9517 (WHC-SA–2756) **Achievement of process control, safety, and regulatory compliance in a mixed waste evaporator system at the Hanford Site using data quality objectives.** Von Bargen, B.H. Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950216–3: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95005983. Source: OSTI; NTIS; INIS; GPO Dep.

The Data Quality Objectives (DQO) Process was applied to the operation of the 242-A Evaporator at the Hanford Site. A team consisting of representatives from process engineering, environmental engineering, regulatory compliance, analytical laboratories, and DOE utilized the step by step DQO process to define the issues, variables, and inputs necessary to develop the decision rules which govern plant operations. The sampling and analyses required to make these decisions was then optimized concerning factors such as sample number, total analyses, cost, radiation exposure, quality assurance, and deliverables.

9518 (WHC-SD-C018H-ATP–002) **Acceptance test procedure for C-018H, 242-A evaporator/PUREX plant process condensate treatment facility.** Parrish, D.E. Westinghouse Hanford Co., Richland, WA (United States). 16 Aug 1994. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006833. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance Test Procedure (ATP) has been prepared to demonstrate that the Electrical/Instrumentation system function as required for this facility. Each company or organization participating in this ATP will designate personnel to assume the responsibilities and duties as defined herein for their respective roles.

9519 (WHC-SD-CP-ANAL–008) **Fire modeling for Building 221-T - T Plant Canyon Deck and Railroad Tunnel.** Oar, D.L. Westinghouse Hanford Co., Richland, WA (United States). 29 Sep 1994. 121p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006893. Source: OSTI; NTIS; INIS; GPO Dep.

This report was prepared by Hughes Associates, Inc. to document the results of fire models for building 221-T Canyon Deck and Railroad Tunnel. Backup data is contained in document No. WHC-SD-CP-ANAL-010, Rev. 0.

9520 (WHC-SD-CP-HC–004) **UO_3 building hazard classification - deactivated state.** Dodd, E.N. III. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005069. Source: OSTI; NTIS; INIS; GPO Dep.

This document identifies the hazards classification of UO_3 facility in the deactivated state.

9521 (WHC-SD-CP-TC–032) **HC-21C off-gas test procedure.** Cunningham, L.T. Westinghouse Hanford Co., Richland, WA (United States). 14 Dec 1994. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005053. Source: OSTI; NTIS; GPO Dep.

The goal of this test plan is to determine the cause and location of water formation in the sludge stabilization off-gas system. The results should help determine what design improvements or processing steps will be implemented to prevent this phenomena from occurring in the future. This test procedure will include a series of tests to determine where and why liquid is condensing in the HC-21C furnace off-gas system. The tests will take a sequential, graded approach and may be concluded one the results have satisfactorily resolved the problem.

9522 (WHC-SD-CP-TP–082) **Loss/gain on ignition testing for HC-21C.** De Vries, M.L. Westinghouse Hanford Co., Richland, WA (United States). 12 Dec 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005220. Source: OSTI; NTIS; INIS; GPO Dep.

The HC-21C thermal stabilization process stabilizes reactive plutonium bearing material for long term storage. A Loss On Ignition (LOI) analysis is performed on all materials that are stabilized in the muffle furnaces prior to being stored in the vaults to ensure suitability for vault storage. The material is required to have a LOI of less than 1% (OSD-184-00013 Limit). The LOI analysis is performed to assure that all volatiles that could potentially pressurize the sealed containers over long periods of time, like water, have been removed. It is possible, while performing LOI analysis to see a Gain On Ignition (GOI) due to additional oxidation of materials. In the current stabilization campaign, two items processed have had a positive LOI or GOI result. One concern with a GOI is that the weight gain may actually be masking a weight loss. (Reference 15530-94-WSL-156). Other concerns with a GOI result are that the removal of the oxygen could create a vacuum in the product can causing it to collapse during long term storage or the oxidation of material would increase the volume of the solids potentially bulging or rupturing the product container. In the past, GOIs have been seen on items that were processed through Hoskin's pot furnaces located in glovebox HA-21I. This test plan provides instruction to test causes of a GOI and to ensure the processed material with a GOI result will not cause a problem during long term storage. Product cans that are sampled for LOI and have results showing a gain of weight will be the test items.

9523 (WHC-SD-CP-TRP–060) **Heat exchanger bypass test report.** De Vries, M.L. Westinghouse Hanford Co., Richland, WA (United States). 26 Jan 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006781. Source: OSTI; NTIS; INIS; GPO Dep.

This test report documents the results that were obtained while conducting the test procedure which bypassed the heat exchangers in the HC-21C sludge stabilization process. The test was performed on November 15, 1994 using WHC-SD-CP-TC-031, "Heat Exchanger Bypass Test Procedure." The primary objective of the test procedure was to determine if the heat exchangers were

contributing to condensation of moisture in the off-gas line. This condensation was observed in the rotameters. Also, a secondary objective was to determine if temperatures at the rotameters would be too high and damage them or make them inaccurate without the heat exchangers in place.

9524 (WHC-SD-EN-TI–223) **Geophysical investigation of the SQ Tanks, 221-T Building, 200 West Area.** Mitchell, T.H. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005640. Source: OSTI; NTIS; INIS; GPO Dep.

The SQ Tanks are located on the northwest side of the 221-T plant, in the 200-West Area of the Hanford Reservation. The objective of the survey was to locate subsurface obstructions that may affect the removal of tanks and supporting structures. Based upon the results of the survey, obstructions and linears were identified. Access was limited in the survey area due to structures, buildings, and construction work.

9525 (WHC-SD-EN-TI–282) **Geophysical surveys for proposed boreholes 299-W15-25, 26 and 27, 200 West Area.** Mitchell, T.H. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005631. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of the survey was to locate subsurface obstructions that may affect the drilling of the proposed boreholes 299-W15-25, 299-w15-26, and 299-W15-27, north of the 321-Z building. The possible drill sites within the zone with the least likelihood of encountering identified obstructions were identified based on the results of the survey. Ground-penetrating radar (GPR) was the geophysical method chosen for the shallow characterization of this site.

9526 (WHC-SD-ETF-TA–001) **Documentation assessment, Project C-018H, 200-E area effluent treatment facility.** Peres, M.W.; Connor, M.D.; Mertelendy, J.I. Westinghouse Hanford Co., Richland, WA (United States). 21 Dec 1994. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005641. Source: OSTI; NTIS; INIS; GPO Dep.

Project C-018H is one of the fourteen subprojects to the Hanford Environmental Compliance (HEC) Project. Project C-018H provides treatment and disposal for the 242-A Evaporator and PUREX plant process condensate waste streams. This project used the Integrated Management Team (IMT) approach proposed by RL. The IMT approach included all affected organizations on the project team to coordinate and execute all required project tasks, while striving to integrate and satisfy all technical, operational, functional, and organizational objectives. The HEC Projects were initiated in 1989. Project C-018H began in early 1990, with completion of construction currently targeted for mid-1995. This assessment was performed to evaluate the effectiveness of the management control on design documents and quality assurance records developed and submitted for processing, use, and retention for the Project. The assessment focused primarily on the overall adequacy and quality of the design documentation currently being submitted to the project document control function.

9527 (WHC-SD-F031-PMP–002) **Fast Flux Test Facility, Sodium Storage Facility project-specific project management plan.** Shank, D.R. Westinghouse Hanford Co., Richland, WA (United States). 29 Dec 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005294. Source: OSTI; NTIS; INIS; GPO Dep.

This Project-Specific Project Management Plan describes the project management methods and controls used by the WHC Projects Department to manage Project 03-F-031. The Sodium Storage Facility provides for storage of the 260,000 gallons of sodium presently in the FFTF Plant. The facility will accept the molten sodium transferred from the FFTF sodium systems, and store the sodium in a solid state under an inert cover gas until such time as a Sodium Reaction Facility is available for final disposal of the sodium.

9528 (WHC-SD-F031-QAPP–001) **Project quality assurance plant: Sodium storage facility, project F-031.** Shultz, J.W.; Shank, D.R. Westinghouse Hanford Co., Richland, WA (United States). Nov 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005291. Source: OSTI; NTIS; INIS; GPO Dep.

The Sodium Storage Facility Project Quality Assurance Plan delineates the quality assurance requirements for construction of a new facility, modifications to the sodium storage tanks, and tie-ins to the FFTF Plant. This plan provides direction for the types of verifications necessary to satisfy the functional requirements within the project scope and applicable regulatory requirements determined in the Project Functional Design Criteria (FDC), WHC-SD-FF-FDC-009.

9529 (WHC-SD-FF-EV–002) **Test report for run-in acceptance testing of hydrogen mitigation test pump-2.** Brewer, A.K.; Kolowith, R. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005141. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the results of the run-in test of the replacement mixer pump for the Tank 241-SY-101. The test was conducted at the 400 Area MASF facility between August 12 and September 29, 1994. The report includes findings, analysis, recommendations, and corrective actions taken.

9530 (WHC-SD-HWV-WP–005) **Release of HWVP design media.** Bevins, R.R. Westinghouse Hanford Co., Richland, WA (United States). 5 Oct 1994. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002072. Source: OSTI; INIS; NTIS; GPO Dep.

Late in 1993 the Hanford Waste Vitrification Plant (HWVP) Project was given direction by the US Department of Energy (DOE), Richland Operations Office (RL) to defer design activities on the project. As a result of this direction, detailed design work on most structures was stopped and the design information was stored. Design and construction work was carried to completion on a few of the HWVP packages. The packages that were carried to completion are the subject of this work plan.

9531 (WHC-SD-PRP-HA–017) **233-S plutonium concentration facility hazards assessment.** Broz, R.E. Westinghouse Hanford Co., Richland, WA (United States). 19 Dec 1994. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005649. Source: OSTI; NTIS; INIS; GPO Dep.

This document establishes the technical basis in support of Emergency Planning activities for the 233-S Plutonium Concentration Facility on the Hanford Site. The document represents an acceptable interpretation of the implementing guidance document for DOE ORDER 5500.3A. Through this document, the technical basis for the development of facility specific Emergency Action Levels and the Emergency Planning Zone is demonstrated.

9532 (WHC-SD-SNF-ER–005) **Testing of isolation barrier sealing surfaces.** Graves, C.E. Westinghouse Hanford Co., Richland, WA (United States). 15 Dec 1994. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005432. Source: OSTI; NTIS; INIS; GPO Dep.

Isolation barrier doors are to be installed in the 105KE and 105KW basins as part of the 1994 unreviewed safety question (USQ) resolution plan to isolate the fuel storage basin from the fuel discharge chute. Included in this installation is the placement of new sealing surfaces for the barriers by affixing stainless steel plates to existing carbon steel angle bars with a specially formulated epoxy adhesive/sealant material. The sealant is a two-part component consisting of an epoxy resin (the condensation product of bisphenol A and epichlorohydrin) and a curing agent (a proprietary cycloaliphatic polyamine). The sealant is solvent free (complying with air pollution regulations) and capable of withstanding the surrounding radiation fields over an estimated 15-year service life. The epoxy sealant experiences negligible water damage partly because of its hydrophobic (water-repelling) nature. With bond tensile strengths measured at greater than 862 kPa (125 lbf/

in^2), the epoxy sealant is judged acceptable for its intended application. The four-hour pot life of the epoxy sealant provides sufficient time to apply the epoxy, examine the epoxy bead for continuity, and position the stainless steel sealing plates.

9533 (WHC-SD-SNF-ER–006) **105-KE Basin isolation barrier leak rate test analytical development.** Irwin, J.J. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005223. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides analytical developments in support of the proposed leak rate test of the 105-KE Basin. The analytical basis upon which the K-basin leak test results will be used ti determine the basin leakage rates is developed in this report. The leakage of the K-Basin isolation barriers under accident conditions will be determined from the test results. There are two fundamental flow regimes that may exist in the postulated K-Basin leakage, viscous laminar and turbulent flow. An analytical development is presented for each flow regime. The basic geometry and nomenclature of the postulated leak paths are denoted.

9534 (WHC-SD-SNF-FRD–003) **Functions and requirements for 105-KE Basin sludge retrieval and packaging.** Feigenbutz, L.V. Westinghouse Hanford Co., Richland, WA (United States). 16 Dec 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005226. Source: OSTI; NTIS; INIS; GPO Dep.

Sludge, and the clouding due to sludge, interferes with basin operation and maintenance activities. This document defines the overall functions and requirements for sludge retrieval and packaging activities to be performed in the 105-KE Basin.

9535 (WHC-SD-SNF-HC–002) **Hazard categorization of 100K east and 100K west in-basin fuel characterization program activities.** Alwardt, L.D. Westinghouse Hanford Co., Richland, WA (United States). 16 Nov 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005295. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the determination that the in-basin activities at 105 K East (KE) and 105 K West (KW) on the Hanford Reservation associated with the fuel characterization program are classified as Hazard Category 3 (hazard analysis shows the potential for only significant localized consequences). Potential accident consequences, a description of significant activities around the site, and hazard identification and management were explored.

9536 (WHC-SD-SNF-PCP–001-Rev.1) **305 Building cold test facility management plan.** Feigenbutz, L.V. Westinghouse Hanford Co., Richland, WA (United States). 9 Dec 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005140. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides direction for the conduct of business in Building 305 for cold testing K-Basin tools and equipment. The Cold Test Facility represents a small portion of the overall building, and as such, the work instructions already implemented in the 305 Building will be utilized.

9537 (WHC-SD-SNF-PMP–008) **IX Disposition Project - project management plan.** Choi, I.G. Westinghouse Hanford Co., Richland, WA (United States). 8 Dec 1994. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005083. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents plans for resolving saving and disposal concerns for ion exchange modules, cartridge filters and columns. This plan also documents the project baselines for schedules, cost, and technical information.

9538 (WHC-SD-SNF-TP–008-Rev.1) **Gas liquid sampling for closed canisters in KW Basin - test plan.** Pitkoff, C.C. Westinghouse Hanford Co., Richland, WA (United States). 19 Jan 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006653. Source: OSTI; NTIS; INIS; GPO Dep.

Test procedures for the gas/liquid sampler. Characterization of the Spent Nuclear Fuel, SNF, sealed in canisters at KW-Basin is needed to determine the state of storing SNF wet. Samples of the liquid and the gas in the closed canisters will be taken to gain characterization information. Sampling equipment has been designed to retrieve gas and liquid from the closed canisters in KW basin. This plan is written to outline the test requirements for this developmental sampling equipment.

9539 (WHC-SD-SQA-CSA–20385) **CSER 94-013: Classification and access to PFP 232-Z Incinerator Facility and limits on characterization and disassembly activities in 232-Z burning hood.** Miller, E.M. Westinghouse Hanford Co., Richland, WA (United States). 12 Jan 1995. 94p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005594. Source: OSTI; NTIS; INIS; GPO Dep.

This CSER justifies the Limited Control Facility designation for the closed Burning Hood in the PFP 232-Z Incinerator Facility. If the Burning Hood is opened to characterize the plutonium distribution and geometric integrity of the internals or for disassembly of the internals, then the more rigorous Fissionable Material Facility classification is required. Two sets of requirements apply for personnel access, criticality firefighting category for water use, and fissile material movement for the two states of the Burning Hood. The parameters used in the criticality analysis are listed to establish the limits under which this CSER is valid. Determination that the Burning Hood fissile material, moderation, or internal arrangements are outside these limits requires reevaluation of these parameter values and activities at the 232-Z Incinerator Facility. When the Burning Hood is open, water entry is to be prevented by two physical barriers for each water source.

9540 (WHC-SD-SQA-CSA–20387) **Addendum 2 to CSER 79-002: Extension of the 150 gram fissile limit used in room 187 of PFP.** Friar, D.E. Westinghouse Hanford Co., Richland, WA (United States). 13 Dec 1994. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006827. Source: OSTI; NTIS; INIS; GPO Dep.

The PFP operating organization requests that the limit set permitting 150 grams fissile be extended to the Hoods 4 and 5 of Room 187. The request for the limit change is explained in the attached request for analysis.

9541 (WHC-SD-TD-RPT–011) **A summary report on the search for current technologies and developers to develop depth profiling/physical parameter end effectors.** Nguyen, Q.H. Westinghouse Hanford Co., Richland, WA (United States). 12 Sep 1994. 187p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002363. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the search strategies and results for available technologies and developers to develop tank waste depth profiling/physical parameter sensors. Sources searched include worldwide research reports, technical papers, journals, private industries, and work at Westinghouse Hanford Company (WHC) at Richland site. Tank waste physical parameters of interest are: abrasiveness, compressive strength, corrosiveness, density, pH, particle size/shape, porosity, radiation, settling velocity, shear strength, shear wave velocity, tensile strength, temperature, viscosity, and viscoelasticity. A list of related articles or sources for each physical parameters is provided.

9542 (WHC-SD-TD-RPT–012) **Vendors search for viscosity sensors for in situ tank waste characterization.** Nguyen, Q.H. Westinghouse Hanford Co., Richland, WA (United States). 7 Oct 1994. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002282. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the search results in identifying manufacturers who can develop viscosity sensors for in situ to waste characterization. Six companies were found that have in-process viscometers.

9543 (WHC-SD-TP-PDC–026) **Packaging design criteria, transfer and disposal of 102-AP mixer pump.** Carlstrom, R.F. Westinghouse Hanford Co., Richland, WA (United States). 23 Nov

1994. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005165. Source: OSTI; NTIS; INIS; GPO Dep.

A mixer pump installed in storage tank 241-AP-102 (102-AP) has failed. This pump is referred to as the 102-AP mixer pump (APMP). The APMP will be removed from 102-AP 1 and a new pump will be installed. The main purpose of the Packaging Design Criteria (PDC) is to establish criteria necessary to design and fabricate a shipping container for the transfer and storage of the APMP from 102-AP. The PDC will be used as a guide to develop a Safety Evaluation for Packaging (SEP).

9544 (WHC-SD-W007H-ATR–002) **BCE selector valves and flow proportional sampler.** Rippy, G.L. Westinghouse Hanford Co., Richland, WA (United States). 11 Aug 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005603. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance Test Procedure (ATP) has been prepared to demonstrate that the Electrical/Instrumentation systems for the B-Plant Process Condensate Treatment Facility (BCE) function as required by project criteria. Tests will be run to: Verify the operation of the solenoid valve and associated limit switches installed for the BCE portion of W-007H; Operate the solenoid valve and verify the proper operation of the associated limit switches based on the position of the solenoid valve;and, Demonstrate the integrity of the Sample Failure Alarm Relay XFA-211BA-BCE-1, and Power Failure ALarm Relay JFA-211BA-BCE-1 located inside the Flow Proportional Sampler in Building 211 BA.

9545 (WHC-SD-W025-ATR–002) **W-025, Acceptance Test Report.** Roscha, V. Westinghouse Hanford Co., Richland, WA (United States). 14 Dec 1994. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005234. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance Test Report (ATR) has been prepared to establish field testing procedures to demonstrate that the Electrical/Instrumentation systems function as intended by the design.

9546 (WHC-SD-W025-FDR–001-Rev.1-Vol.1-2) **Definitive design report: Design report project W-025, Radioactive Mixed Waste (RMW) Land Disposal Facility NON-DRAG-OFF. Revision 1, Volume 1 and 2.** Roscha, V. Westinghouse Hanford Co., Richland, WA (United States). 29 Nov 1994. 431p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004403. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to describe the definitive design of the Radioactive Mixed Waste (RMW) Non-Drag-Off disposal facility, Project W-025. This report presents a n of the major landfill design features and a discussion of how each of the criteria is addressed in the design. The appendices include laboratory test results, design drawings, and individual analyses that were conducted in support of the design. Revision 1 of this document incorporates design changes resulting from an increase in the required operating life of the W-025 landfill from 2 to 20 years. The rationale for these design changes is described in Golder Associates Inc. 1991a. These changes include (1) adding a 1.5-foot-thick layer of compacted admix directory-under the primary FML on the floor of the landfill to mitigate the effects of possible stress cracking in the primary flexible membrane liner (FML), and (2) increasing the operations layer thickness from two to three feet over the entire landfill area, to provide additional protection for the secondary admix layer against mechanical damage and the effects of freezing and desiccation. The design of the W-025 Landfill has also been modified in response to the results of the EPA Method 9090 chemical compatibility testing program (Golder Associates Inc. 1991b and 1991c), which was completed after the original design was prepared. This program consisted of testing geosynthetic materials and soil/bentonite admix with synthetic leachate having the composition expected during the life of the W-025 Landfill., The results of this program indicated that the polyester geotextile originally specified for the landfill might be susceptible to deterioration. On this basis, polypropylene geotextiles were substituted as a more chemically-resistant alternative. In addition, the percentage of bentonite in the admix was increased to provide sufficiently low permeability to the expected leachate.

9547 (WHC-SD-W025-RPT–001) **Construction quality assurance report.** Roscha, V. Westinghouse Hanford Co., Richland, WA (United States). 8 Sep 1994. 954p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930 ; AC06-89RL11615. Order Number DE95005935. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides a summary of the construction quality assurance (CQA) observation and test results, including: The results of the geosynthetic and soil materials conformance testing. The observation and testing results associates with the installation of the soil liners. The observation and testing results associated with the installation of the HDPE geomembrane liner systems. The observation and testing results associated with the installation of the leachate collection and removal systems. The observation and testing results associated with the installation of the working surfaces. The observation and testing results associated with in-plant manufacturing process. Summary of submittal reviews by Golder Construction Services, Inc. The submittal and certification of the piping material specifications. The observation and verification associated of the Acceptance Test Procedure results of the operational equipment functions. Summary of the ECNs which are incorporated into the project.

9548 (WHC-SD-W026-PLN–005) **WRAP Module 1 waste characterization plan.** Mayancsik, B.A. Westinghouse Hanford Co., Richland, WA (United States). 23 Jan 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006886. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to present the characterization methodology for waste generated, processed, or otherwise the responsibility of the Waste Receiving and Processing (WRAP) Module 1 facility. The scope of this document includes all solid low level waste (LLW), transuranic (TRU), mixed waste (MW), and dangerous waste. This document is not meant to be all-inclusive of the waste processed or generated within WRAP Module 1, but to present a methodology for characterization. As other streams are identified, the method of characterization will be consistent with the other streams identified in this plan. The WRAP Module 1 facility is located in the 200 West Area of the Hanford Site. The facility's function is two-fold. The first is to verify/characterize, treat and repackage contact handled (CH) waste currently in retrievable storage in the LLW Burial Grounds, Hanford Central Waste Complex, and the Transuranic Storage and Assay Facility (TRUSAF). The second is to verify newly generated CH TRU waste and LLW, including MW. The WRAP Module 1 facility provides NDE and NDA of the waste for both drums and boxes. The NDE is used to identify the physical contents of the waste containers to support waste characterization and processing, verification, or certification. The NDA results determine the radioactive content and distribution of the waste.

9549 (WHC-SD-W026-TC–002) **Test procedure for boxed waste assay system.** Wachter, J. (Los Alamos National Lab., NM (United States)). Westinghouse Hanford Co., Richland, WA (United States); Los Alamos National Lab., NM (United States). 7 Dec 1994. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004981. Source: OSTI; NTIS; INIS; GPO Dep.

This document, prepared by Los Alamos National Laboratory's NMT-4 group, details the test methodology and requirements for Acceptance/Qualification testing of a Boxed Waste Assay System (BWAS) designed and constructed by Pajarito Scientific Corporation. Testing of the BWAS at the Plutonium Facility (TA55) at Los Alamos National Laboratory will be performed to ascertain system adherence to procurement specification requirements. The test program shall include demonstration of conveyor handling capabilities, gamma ray energy analysis, and imaging passive/active neutron accuracy and sensitivity. Integral to these functions is the system's embedded operating and data reduction software.

9550 (WHC-SD-W049-ATR–001) **Project W-049H disposal facility test report.** Buckles, D.I. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005440. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this Acceptance Test Report (ATR) for the Project W-049H, Treated Effluent Disposal Facility, is to verify that the equipment installed in the Disposal Facility has been installed in accordance with the design documents and function as required by the project criteria.

9551 (WHC-SD-W049H-ATR–003) **Project W-049H instrument & control acceptance test report.** Johnston, G.A. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 92p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005080. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance Test Report documents the completed Acceptance Test Procedure WHC-SD-W049H-ATP-003.

9552 (WHC-SD-W058-WP–001) **Engineering work plan for design requirements document, Project W-058/028.** Mendoza, D.P. Westinghouse Hanford Co., Richland, WA (United States). 5 Jan 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005672. Source: OSTI; NTIS; INIS; GPO Dep.

This work plan outlines the tasks necessary for developing the Design Requirements Document (DRD) for project W-058/028, Replacement of Cross-Site Transfer System. The DRD is a specification which bounds, at a high level, the requirements of a discrete system element of the Tank Waste Remediation System (TWRS) Program. This document defines the scope and schedule for the development and production of the Design Requirements, Document for Project W-058.

9553 (WHC-SD-W087-PMP–001-Rev.1) **Project management plan for Project 93L-EWW-087, "222-S radioactive liquid waste line replacement".** Beyer, J.J. Westinghouse Hanford Co., Richland, WA (United States). 5 Dec 1994. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005620. Source: OSTI; NTIS; INIS; GPO Dep.

Direct revision, to rev. 1, of the Project Management Plan for Project 93L-EWW-087, "222-S Radioactive Liquid Waste Line Replacement."

9554 (WHC-SD-W100-TI–009) **Criticality classification of waste receiving and processing module 2A.** Boothe, G.F. Westinghouse Hanford Co., Richland, WA (United States). Oct 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005647. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to evaluate the criticality potential of the Waste Receiving and Processing Module 2A (WRAP 2A) and to demonstrate that the facility is an exempt facility, under the provisions of the Nuclear Criticality Safety Manual. The WRAP 2A maximum potential transuranic (TRU) contents of feedstreams and product inventories are discussed. Total plant fissionable materials are estimated and compared with the fissionable material exempt quantity. The WRAP 2A operations and processes are also described, relative to the potential for concentrating or accumulating fissionable material within the facility.

9555 (WHC-SD-W112-SDRD–001) **Supplemental design requirements document enhanced radioactive and mixed waste storage Phase V Project W-112.** Ocampo, V.P.; Boothe, G.F.; Greager, T.M.; Johnson, K.D.; Kooiker, S.L.; Martin, J.D. Westinghouse Hanford Co., Richland, WA (United States). Nov 1994. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005050. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides additional and supplemental information to WHC-SD-W112-FDC-001, Project W-112 for radioactive and mixed waste storage. It provides additional requirements for the design and summarizes Westinghouse Hanford Company key design guidance and establishes the technical baseline agreements to be used for definitive design of the Project W-112 facilities.

9556 (WHC-SD-W113-SDRD–001) **Supplmental design requirements document enhanced radioactive and mixed waste storage: Phase 5, Project W-113.** Ocampo, V.P. Westinghouse Hanford Co., Richland, WA (United States). Nov 1994. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005066. Source: OSTI; NTIS; INIS; GPO Dep.

This Supplemental Design Requirements Document (SDRD) is used to communicate Project W-113 specific plant design information from Westinghouse Hanford Company (WHC) to the United States Department of Energy (DOE) and the cognizant Architect Engineer (A/E). The SDRD is prepared after the completion of the project Conceptual Design report (CDR) and prior to the initiation of definitive design. Information in the SDRD serves two purposes: to convey design requirements that are too detailed for inclusion in the Functional Design Criteria (FDC) report and to serve as a means of change control for design commitments in the Title I and Title II design. The Solid Waste Retrieval Project (W-113) SDRD has been restructured from the equipment based outline used in previous SDRDs to a functional systems outline. This was done to facilitate identification of deficiencies in the information provided in the initial draft SDRD and aid design confirmation. The format and content of this SDRD adhere as closely as practicable to the requirements of WHC-CM-6-1, Standard Engineering Practices for Functional Design Criteria.

9557 (WHC-SD-W151-WP–005) **Project W-151 development work plan for: Tank AZ-101 riser mapping tool and data acquisition system.** Crass, D.W. Westinghouse Hanford Co., Richland, WA (United States). 31 Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006782. Source: OSTI; NTIS; INIS; GPO Dep.

This document identifies a plan for developing, assembling, and testing a data acquisition system for a 6-inch schedule 40 riser mapping profiler. This plan includes testing and qualifying and integrated system (data acquisition system, riser mapping profiler, and hoist positioner) for plant use. The integrated system supports project W-151 construction activities and will measure diameter, ovality, and vertical alignment of 6-inch risers. Dimensional data will be received by the data acquisition system and stored for later transfer to a portable computer.

9558 (WHC-SD-W178-PMP–001) **Project management plan for Project W-178, 219-S secondary containment.** Buckles, D.I. Westinghouse Hanford Co., Richland, WA (United States). 26 Jan 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006883. Source: OSTI; NTIS; INIS; GPO Dep.

This Project Management Plan (PMP) establishes the organizational responsibilities, control systems, and procedures for managing the execution of project activities for Project W-178, the 219-S Secondary Containment Upgrade. The scope of this project will provide the 219-S Facility with secondary containment for all tanks and piping systems. Tank 103 will be replaced with a new tank which will be designated as Tank 104. Corrosion protection shall be installed as required. The cells shall be cleaned and the surface repaired as required. The 219-S Waste Handling Facility (219-S Facility), located in the 200 West Area, was constructed in 1951 to support the 222-S Laboratory Facility. The 219-S Facility has three tanks, TK-101, TK-102, and TK-103, which receive and neutralize low level radioactive wastes from the 222-S Laboratory. For purposes of the laboratory, the different low level waste streams have been designated as high activity and intermediate activity. The 219-S Facility accumulates and treats the liquid waste prior to transferring it to SY Tank Farm in the 200-W Area. Transfers are normally made by pipeline from the 219-S Facility to the 241-SY Tank Farm. Presently transfers are being made by tanker truck to the 200-E Area Tank Farms due to the diversion box catch tank which has been removed from service.

9559 (WHC-SD-W236A-ER–009) **Results from evaporation tests to support the MWTF heat removal system design.** Crea, B.A. Westinghouse Hanford Co., Richland, WA (United States). 22 Dec 1994. 103p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005227. Source: OSTI; NTIS; INIS; GPO Dep.

An experimental tests program was conducted to measure the evaporative heat removal from the surface of a tank of simulated waste. The results contained in this report constitute definition design data for the latest heat removal function of the MWTF primary ventilation system.

9560 (WHC-SD-W236A-ER–015) **Life-cycle cost analysis 200-West Weather Enclosure: Multi-function Waste Tank Facility.** Umphrey, M.R. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); ICF Kaiser Hanford Co., Richland, WA (United States). 16 Jan 1995. 68p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005985. Source: OSTI; NTIS; INIS; GPO Dep.

The Multi-Function Waste Tank Facility (MWTF)will provide environmentally safe and acceptable storage capacity for handling wastes resulting from the remediation of existing single-shell and double-shell tanks on the Hanford Site. The MWTF will construct two tank farm facilities at two separate locations. A four-tank complex will be constructed in the 200-East Area of the Hanford Site; a two-tank complex will be constructed in the 200-West Area. This report documents the results of a life-cycle cost analysis performed by ICF Kaiser Hanford Company (ICF KH) for the Weather Enclosure proposed to be constructed over the 200-West tanks. Currently, all tank farm operations on the Hanford Site are conducted in an open environment, with weather often affecting tank farm maintenance activities. The Weather Enclosure is being proposed to allow year-round tank farm operation and maintenance activities unconstrained by weather conditions. Elimination of weather-related delays at the MWTF and associated facilities will reduce operational costs. The life-cycle cost analysis contained in this report analyzes potential cost savings based on historical weather information, operational and maintenance costs, construction cost estimates, and other various assumptions.

9561 (WHC-SD-W236A-MP–001-Rev.1) **Management plan – Multi-Function Waste Tank Facility. Revision 1.** Fritz, R.L. Westinghouse Hanford Co., Richland, WA (United States). 11 Jan 1995. 92p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95007219. Source: OSTI; NTIS; INIS; GPO Dep.

This Westinghouse Hanford Company (WHC) Multi-Function Waste Tank Facility (MWTF) Management Plan provides guidance for execution WHC MWTF Project activities related to design, procurement, construction, testing, and turnover. This Management Plan provides a discussion of organizational responsibilities, work planning, project management systems, quality assurance (QA), regulatory compliance, personnel qualifications and training, and testing and evaluations. Classified by the US Department of Energy (DOE) as a major systems acquisition (MSA), the MWTF mission is to provide a safe, cost-effective, and environmentally sound method for interim storage of Hanford Site high-level wastes. This Management Plan provides policy guidance and direction to the Project Office for execution of the project activities.

9562 (WHC-SD-W236A-PLN–002) **Design review plan for Multi-Function Waste Tank Facility (Project W-236A).** Renfro, G.G. Westinghouse Hanford Co., Richland, WA (United States). 20 Dec 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005104. Source: OSTI; NTIS; INIS; GPO Dep.

This plan describes how the Multi-Function Waste Tank Facility (MWTF) Project conducts reviews of design media; describes actions required by Project participants; and provides the methodology to ensure that the design is complete, meets the technical baseline of the Project, is operable and maintainable, and is constructable. Project W-236A is an integrated project wherein the relationship between the operating contractor and architect-engineer is somewhat different than that of a conventional project. Working together, Westinghouse Hanford Company (WHC) and ICF Karser Hanford (ICF KH) have developed a relationship whereby ICF KH performs extensive design reviews and design verification. WHC actively participates in over-the-shoulder reviews during design development, performs a final review of the completed design, and conducts a formal design review of the Safety Class I, ASME boiler and Pressure Vessel Code items in accordance with WHC-CM-6-1, Standard Engineering Practices.

9563 (WHC-SD-W236A-TI–004) **Recommendation on changing interfaces of W-058 and W-236A.** Light, J.M. Westinghouse Hanford Co., Richland, WA (United States). 20 Dec 1994. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005105. Source: OSTI; NTIS; INIS; GPO Dep.

This position paper recommends changes to improve the interface between the Cross-Site Transfer System (Project W-058) and the Multi-Function Waste Tank Facility (Project W-236A) to handle planned waste retrieval and storage operations. Appendix A includes cost estimates and schedule impacts for each project. The cost estimates, schedule impacts, and this position paper will be the basis for writing a change request to formally implement these changes on Project W-236A and Project W-058/W-028. Recommendations are made on pipeline rerouting, pump and configuration, and flushing configuration.

9564 (WHC-SD-W236A-TI–006) **Kaiser Engineers Hanford internal position paper – Project W-236A, Multi-function Waste Tank Facility – Peer reviews of selected activities.** Stine, M.D. (Kaiser Engineers Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Kaiser Engineers Hanford Co., Richland, WA (United States). 4 Jan 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006656. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this paper is to develop and document a proposed position on the performance of independent peer reviews on selected design and analysis components of the Title 1 [Preliminary] and Title 2 [Final] design phases of the Multi-Function Waste Tank Facility [MWTF] project. An independent, third-party peer review is defined as a documented critical review of documents, data, designs, design inputs, tests, calculations, or related materials. The peer review should be conducted by persons independent of those who performed the work, but who are technically qualified to perform the original work. The peer review is used to assess the validity of assumptions and functional requirements, to assess the appropriateness and logic of selected methodologies and design inputs, and to verify calculations, analyses and computer software. The peer review can be conducted at the end of the design activity, at specific stages of the design process, or continuously and concurrently with the design activity. This latter method is often referred to as "Continuous Peer Review."

9565 (WHC-SD-W236A-TI–007) **Position paper - tank inlet air temperatures.** Goolsby, G.K. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006630. Source: OSTI; NTIS; INIS; GPO Dep.

Position Paper to develop and document a position on the design inlet air temperature of the heat removal system for the waste storage tanks currently being designed by project W-236A, the MWTF Project.

9566 (WHC-SD-W236A-TI–008) **Position paper – Tank ventilation system design air flow rates.** Goolsby, G.K. Westinghouse Hanford Co., Richland, WA (United States). 4 Jan 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006631. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this paper is to document a project position on required ventilation system design air flow rates for the waste storage tanks currently being designed by project W-236A, the Multi-Function Waste Tank Facility (MWTF). The Title 1 design primary tank heat removal system consists of two systems: a primary tank vapor space ventilation system; and an annulus ventilation system. At the conclusion of Title 1 design, air flow rates for the primary and annulus ventilation systems were 960 scfm and 4,400

scfm, respectively, per tank. These design flow rates were capable of removing 1,250,000 Btu/hr from each tank. However, recently completed and ongoing studies have resulted in a design change to reduce the extreme case heat load to 700,000 Btu/hr. This revision of the extreme case heat load, coupled with results of scale model evaporative testing performed by WHC Thermal Hydraulics, allow for a reduction of the design air flow rates for both primary and annulus ventilation systems. Based on the preceding discussion, ICF Kaiser Hanford Co. concludes that the design should incorporate the following design air flow rates: Primary ventilation system–500 scfm maximum and Annulus ventilation system–1,100 scfm maximum. In addition, the minimum air flow rates in the primary and annulus ventilation systems will be investigated during Title 2 design. The results of the Title 2 investigation will determine the range of available temperature control using variable air flows to both ventilation systems.

9567 (WHC-SD-W236A-TI–009) **Position paper - primary ventilation system configuration.** Dalpiaz, E.L. Westinghouse Hanford Co., Richland, WA (United States). Jun 1994. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006655. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this paper is to develop and document a position on the configuration of the primary ventilation system. This configuration will be used on the waste storage tanks currently being designed for the Multi-Function Waste Tank Facility. The primary ventilation system provides a single treatment train and exhaust fan for each waste storage tank. The ventilation systems from each of two tanks are grouped with an additional treatment train and exhaust fan that function as backup to either of the two systems.

9568 (WHC-SD-W236A-TI–010-Rev.1) **Position paper – Tank heat loading. Revision 1.** Groth, B.D. Westinghouse Hanford Co., Richland, WA (United States). 11 Jan 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006802. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this paper is to provide an update to Project W-236A, Multi-function Waste Tank Facility (MWTF), Project File documentation on the selection of the heat removal capability that MWTF Tank Ventilation Systems will be designed to remove. Further scale model mixing tests, as well as greater understanding of the mission of the tanks and the radionuclide heat load, have shown the current heat removal capabilities to be over-designed. Using the latest available information will decrease the amount of conservatism currently in the design. It is important to note that this paper is not for defining the tank mixer pump requirements, but is to be only used for defining and defending the nominal and extreme case heat generation rate that the ventilation system and other heat removal systems will be designed to remove. There are three main heat loads in the tanks of which two can be controlled to a certain extent through operational considerations. These two are mixing pump heat and heat of chemical addition. The third heat source is radionuclide content which can only be controlled by what wastes are pumped to the tank and whether it is diluted prior to pumping. Other heat loads such as transfer pumps were considered to be negligible. In addition, chemical addition is considered a transient situation that is rarely performed and will be treated as such.

9569 (WHC-SD-W236A-TI–011) **Position paper – Tank temperature element location.** Groth, B.D. Westinghouse Hanford Co., Richland, WA (United States). 4 Jan 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006659. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this paper is to develop and document a position on the number and location of temperature elements to be used in the Project W-236A, Multi-Function Waste Tank Facility (MWTF) waste storage tanks. The current preliminary design for the temperature element (TE) placement in the MWTF waste tanks is essentially a copy of the TE placement in existing Double-Shell Tanks (DST). The basis for the placement of these TEs in existing farms is not widely documented and was arrived at by consensus of participating engineers. Current designs call for 194 TEs in each tank on the primary tank bottom, sides, support pad, foundation, and on the secondary tank concrete walls, dome, and haunch. An additional 18 TEs are located in the waste itself on a temperature tree. The MWTF project office has determined and is seeking concurrence that temperatures in the primary tank bottom and walls, in the secondary tank concrete walls and dome, and in the primary tank support pad, and in the tank foundation, be monitored primarily in one quadrant instead of all four. It has also been recommended by personnel performing the thermal hydraulic analysis of the tanks that it would be desirable to know the temperature in the annulus air space above the air inlet manifolds where air mixing occurs with air coming from underneath the tanks. TEs will be added in this location.

9570 (WHC-SD-W236A-TI–013) **Position paper – Continuous air monitor (CAM) acquisition recommendation.** Hughes, M.E. Westinghouse Hanford Co., Richland, WA (United States). 4 Jan 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006598. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this position paper is to document the decision not to acquire continuous air monitors (CAM's) from government excess/surplus supplies. The procurement plan for equipment to be acquired for project W-236A, the Multi-Function Waste Tank Facility (MWTF), stipulates that radiation monitoring equipment will be supplied by WHC via the stock retained within the excess/surplus inventory or utilization of procured instruments from canceled projects. Technological advances within the radiation detection industry have ultimately outdated the instruments that are available within the excess/surplus stock. These machines represent the technology of the 1970's era. The CAM models in use or within the excess/surplus supplies are obsolete and have been discontinued by the manufacturer. Therefore, the majority of the excess/surplus CAM's are being reacquired and disassembled by instrument shops for in-house acquisition of spare parts for the instruments that are still presently in-service. It is being recommended by W-236A projects department that the strategy to acquire surplus/excess radiation monitoring devices be modified. The recommendation is to directly procure instruments that are equal to the technology available within this industry.

9571 (WHC-SD-W236A-TI–014) **Position paper - peer review and design verification of selected activities.** Stine, M.D. Westinghouse Hanford Co., Richland, WA (United States). Sep 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006654. Source: OSTI; NTIS; INIS; GPO Dep.

Position Paper to develop and document a position on the performance of independent peer reviews on selected design and analysis components of the Title I (preliminary) and Title II (detailed) design phases of the Multi-Function Waste Tank Facility project.

9572 (WHC-SD-W236A-WP–002) **Project W-236A, work plan for preparation of a design requirements document.** Groth, B.D. Westinghouse Hanford Co., Richland, WA (United States). 30 Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006887. Source: OSTI; NTIS; INIS; GPO Dep.

This work plan outlines the tasks necessary, and defines the organizational responsibilities for preparing a Design Requirements Document (DRD) for project W-236A, Multi-Function Waste Tank Facility (MWTF). A DRD is a Systems Engineering document which bounds, at a high level, the requirements of a discrete system element of the Tank Waste Remediation System (TWRS) Program. This system element is usually assigned to a specific project, in this case the MWTF. The DRD is the document that connects the TWRS program requirements with the highest level projects requirements and provides the project's link to the overall TWRS mission. The MWTF DRD effort is somewhat unique in that the project is already in detailed design, whereas a DRD is normally prepared prior to preliminary design. The MWTF design effort was initiated with a Functional Design Criteria (FDC) and a Supplemental Design Requirements Document (SDRD) bounding the high level requirements. Another unique aspect of this effort is that some of the TWRS program requirements are still in development. Because of these unique aspects of the MWTF DRD development,

the MWTF will be developed from existing TWRS Program requirements and project specific requirements contained in the FDC and SDRD. The following list describes the objectives of the MWTF DRD: determine the primary functions of the tanks through a functional decomposition of the TWRS Program high level functions; allocate the primary functions to a sub-system architecture for the tanks; define the fundamental design features in terms of performance requirements for the system and subsystems; identify system interfaces and design constraints; and document the results in a DRD.

9573 (WHC-SD-W236B-EV–001-Rev.2) **Permitting plan for project W-236B, initial pretreatment module.** Tollefson, K.S. Westinghouse Hanford Co., Richland, WA (United States). 25 Jan 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006778. Source: OSTI; NTIS; INIS; GPO Dep.

The Tank Waste Remediation System pretreatment process mission is to separate high-level and low-level waste fractions. A comprehensive review of environmental regulations has indicated that several environmental reviews, permits, and approvals are required before construction and operation of the facility. This revised document provides a summary of permit application data requirements, alternative strategies for permit completion and approval, as well as the probability of success for each alternative for the Initial Pretreatment Module resulting from recent revisions to the Tri-Party Agreement.

9574 (WHC-SD-W306-SDRD–001) **Supplemental design requirements document solid waste operations complex.** Ocampo, V.P. (and others); Boothe, G.F.; Broz, D.R.; Eaton, H.E.; Greager, T.M.; Huckfeldt, R.A.; Kooiker, S.L.; Lamberd, D.L.; Lang, L.L.; Myers, J.B. Westinghouse Hanford Co., Richland, WA (United States). Nov 1994. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005229. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides additional and supplemental information to the WHC-SD-W112-FDC-001, WHC-SD-W113-FDC-001, and WHC-SD-W100-FDC-001. It provides additional requirements for the design and summarizes Westinghouse Hanford Company key design guidance and establishes the technical baseline agreements to be used for definitive design common to the Solid Waste Operations Complex (SWOC) Facilities (Project W-112, Project W-113, and WRAP 2A).

9575 (WHC-SD-W306-TI–003) **Hazard control indices for radiological and non-radiological materials.** Boothe, G.F. Westinghouse Hanford Co., Richland, WA (United States). 21 Dec 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005621. Source: OSTI; NTIS; INIS; GPO Dep.

This document devises a method of comparing radiological and non-radiological hazard control levels. Such a comparison will be useful in determining the design control features for facilities that handle radioactive mixed waste. The design control features of interest are those that assure the protection of workers and the environment from unsafe airborne levels of radiological or non-radiological hazards.

9576 (WHC-SD-W314-FRD–001) **Functions and requirements for tank farm restoration and safe operations, Project W-314. Revision 3.** Garrison, R.C. Westinghouse Hanford Co., Richland, WA (United States). 1 Feb 1995. 283p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006790. Source: OSTI; NTIS; INIS; GPO Dep.

This Functions and Requirements document (FRD) establishes the basic performance criteria for Project W-314, in accordance with the guidance outlined in the letter from R.W. Brown, RL, to President, WHC, "Tank Waste Remediation System (TWRS) Project Documentation Methodology," 94-PRJ-018, dated 3/18/94. The FRD replaces the Functional Design Criteria (FDC) as the project technical baseline documentation. Project W-314 will improve the reliability of safety related systems, minimize onsite health and safety hazards, and support waste retrieval and disposal activities by restoring and/or upgrading existing Tank Farm facilities and systems. The scope of Project W-314 encompasses the necessary restoration upgrades of the Tank Farms' instrumentation, ventilation, electrical distribution, and waste transfer systems.

9577 (WHC-SD-W320-DA–001) **Structural analysis of the equipment removal system for tanks 241C106 and 241AY102.** Mackey, T.C. Westinghouse Hanford Co., Richland, WA (United States). Oct 1994. 238p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005289. Source: OSTI; NTIS; INIS; GPO Dep.

The calculations documented in this report show that the ERS major components are structurally qualified to complete the objective: install the removed equipment into a shipping container, transport and store the container at the Central Waste Complex (CWC). The analysis for the structural members of the ERS components considers live load with an impact factor of 125% and dead load. An allowable stress of 1/3 yield is used for all structural components carrying the load based on DOE-RL-92-36. Adherence to DOE-RL-92-36 is not a code requirement. However, due to the loads considered, this factor of safety is appropriate. The calculations meet the strength requirements of the American Institute for Steel Construction (AISC 1989) for all non-critical structural elements.

9578 (WHC-SD-W320-TIS–001-Rev.2) **Qualification test for the flexible receiver. Revision 2.** Tedeschi, D.J. Westinghouse Hanford Co., Richland, WA (United States). 12 Dec 1994. 151p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005214. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the test plan and procedures to certify and design verify the 42″ and 4″-6″ Flexible Receiver as a safety class 3 system. The Flexible Receiver will be used by projects W-151 and W-320 for removing equipment from tanks C-106 and AZ-101.

9579 (WHC-SD-W402-CR–001-Rev.2) **Design criteria tank farm storage and staging facility.** Lott, D.T. Westinghouse Hanford Co., Richland, WA (United States). 23 Jan 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006884. Source: OSTI; NTIS; INIS; GPO Dep.

Tank Farms Operations must store/stage material and equipment until work packages are ready to work. Consumable materials are also required to be stored for routine and emergency work. Safety issues based on poor housekeeping and material deterioration due to weather damage has resulted from inadequate storage space. It has been determined that a storage building in close proximity to the Tank Farm work force would be cost effective. This document provides the design criteria for the design of the storage and staging buildings near 272AW and 272WA buildings.

9580 (WHC-SD-W402-FHA–001) **Fire hazards analysis, east tank farm storage and staging facility.** Lott, D.T.; Huckfeldt, R.A. Westinghouse Hanford Co., Richland, WA (United States). Nov 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005065. Source: OSTI; NTIS; INIS; GPO Dep.

This document identifies the fire hazards of the proposed storage and staging buildings near the 278AW facility.

9581 (WHC-SD-W413-FHA–001) **Fire hazards analysis for W-413, West Area Tank Farm Storage and Staging Facility.** Huckfeldt, R.A.; Lott, D.T. Westinghouse Hanford Co., Richland, WA (United States). 14 Dec 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005073. Source: OSTI; NTIS; INIS; GPO Dep.

In accordance with DOE Order 5480.7A, a Fire Hazards Analysis must be performed for all new facilities. The purpose of the analysis is to comprehensively assess the risk from fire within individual fire areas in relation to proposed fire protection so as to ascertain whether the fire protection objectives of the Order are met. The Order acknowledges a graded approach commensurate with the hazards involved. Tank Farms Operations must sore/stage material and equipment such as pipes, fittings, conduit, instrumentation and

others related items until work packages are ready to work. Consumable materials, such as nut, bolts and welding rod, are also requires to be stored for routine and emergency work. Connex boxes and open storage is currently used for much of the storage because of the limited space at and 272WA. Safety issues based on poor housekeeping and material deteriorating due to weather damage has resulted from this inadequate storage space. It has been determined that a storage building in close proximity to the Tank Farm work force would be cost effective. This facility is classified as a safety class 4 building.

9582 (WHC-SD-WM-ANAL–043) **Estimates of laboratory accuracy and precision on Hanford waste tank samples.** Dodd, D.A. Westinghouse Hanford Co., Richland, WA (United States). 2 Feb 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006786. Source: OSTI; NTIS; INIS; GPO Dep.

A review was performed on three sets of analyses generated in Battelle, Pacific Northwest Laboratories and three sets generated by Westinghouse Hanford Company, 222-S Analytical Laboratory. Laboratory accuracy and precision was estimated by analyte and is reported in tables. The sources used to generate this estimate is of limited size but does include the physical forms, liquid and solid, which are representative of samples from tanks to be characterized. This estimate was published as an aid to programs developing data quality objectives in which specified limits are established. Data resulting from routine analyses of waste matrices can be expected to be bounded by the precision and accuracy estimates of the tables. These tables do not preclude or discourage direct negotiations between program and laboratory personnel while establishing bounding conditions. Programmatic requirements different than those listed may be reliably met on specific measurements and matrices. It should be recognized, however, that these are specific to waste tank matrices and may not be indicative of performance on samples from other sources.

9583 (WHC-SD-WM-AP–033) **Mixed waste trench loading placement instructions.** Johnson, K.D. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005074. Source: OSTI; NTIS; INIS; GPO Dep.

This Document provides instruction for planning where to locate waste to be placed in the Mixed Waste trenches in the 218-W-5 Burial Ground in the 200 West Area.

9584 (WHC-SD-WM-ATP–077-Rev.2) **Enraf Series 854 advanced technology gauge (ATG) acceptance test procedure. Revision 2.** Barnes, G.A. Westinghouse Hanford Co., Richland, WA (United States). 30 Jan 1995. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006907. Source: OSTI; NTIS; INIS; GPO Dep.

This procedure checks that the shipment of the gauge to Hanford did not cause a failure. This procedure provides acceptance testing for Enraf Series 854 level gauges used to monitor levels in Hanford Waste Storage Tanks. The test will verify that the gauge functions according to the manufacturer's instructions and specifications and is properly setup prior to being delivered to the tank farm area. Enraf-Nonius Series 854 level gauges are certified by Factory Mutual (FM) for National Fire Protectional Association (NFPA 70) hazardous Class 1, Division 1, Groups B, C, and D Locations. Its measuring principle is based on the detection of variations in the weight of a displacer suspended in the process fluid. The displacer is connected to a wire wounded on a precision measuring drum. A level change causes a change in the weight of the displacer which will be detected by the force transducer. Electronics within the gauge cause a servo motor to adjust the position of the displacer and compute the tank level based on the new position of the displacer drum. The gauge displays the level in decimal inches. An analog output signal transmits the level data for remote data processing.

9585 (WHC-SD-WM-ATP–080) **Acceptance test procedure for SY Tank Farm replacement exhauster unit.** Becken, G.W. Westinghouse Hanford Co., Richland, WA (United States). 16 Dec 1994. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005081. Source: OSTI; NTIS; INIS; GPO Dep.

The proper functioning of a new 241-SY Tank Farm replacement exhauster will be acceptance tested, to establish operability and to provide an operational baseline for the equipment. During this test, a verification of all of the alarm and control circuits associated with the exhaust, which provide operating controls and/or signals to local and remote alarm/annunciator panels, shall be performed. Test signals for sensors that provide alarms, warnings, and/or interlocks will be applied to verify that alarm, warning, and interlock setpoints are correct. Alarm and warning lights, controls, and local and remote readouts for the exhauster will be verified to be adequate for proper operation of the exhauster. Testing per this procedure shall be conducted in two phases. The first phase of testing, to verify alarm, warning, and interlock setpoints primarily, will be performed in the MO-566 Fab Shop. The second phase of testing, to verify proper operation and acceptable interface with other tank farm systems, will be conducted after the exhauster and all associated support and monitoring equipment have been installed in the SY Tank Farm. The exhauster, which is mounted on a skid and which will eventually be located in the SY tank farm, receives input signals from a variety of sensors mounted on the skid and associated equipment. These sensors provide information such as: exhauster system inlet vacuum pressure; prefilter and HEPA filter differential pressures; exhaust stack sampler status; exhaust fan status; system status (running/shut down); and radiation monitoring systems status. The output of these sensors is transmitted to the exhauster annunciator panel where the signals are displayed and monitored for out-of-specification conditions.

9586 (WHC-SD-WM-ATP–122) **Void fraction instrument software, Version 1.1., acceptance test procedure.** Gimera, M. Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005472. Source: OSTI; NTIS; INIS; GPO Dep.

Provides the plan and procedures for the acceptance test of changes that result in Version 1.1 of void fraction software. The void fraction instrument measures gas by volume in waste storage tanks.

9587 (WHC-SD-WM-ATR–069-Rev.1) **Acceptance test report for tank bottom thermocouples on Tank 241-SY-101.** Zuehlke, A.C. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005076. Source: OSTI; NTIS; INIS; GPO Dep.

This test report documents testing performed per WHC-SD-WM-ATP-069, Rev. 2. The proper monitoring of the 241-SY-101 Tank Bottom and Side Thermocouples (TBSTC) by the Data Acquisition and Control System (DACS) will be tested to establish continued operability of the system. During this test, an end-to-end verification of all of the sensor circuits associated with the TBSTCs, which provide signals both to the DACS computer system and an installed temporary Data Logger, shall be performed by injecting a signal at the appropriate field terminal and verifying the circuit completely through the system to the computer in the DACS trailer and the computer monitor used to display the output of the Data Logger. Each injected signal will be adjusted for appropriate 'near zero', 'mid range' and 'near full scale' values for the sensor being tested. The TBSTC screen, which provides for operator interface with the TBSTCs, will be utilized to monitor testing at the DACS computers. Testing per this procedure shall be conducted after the installation of the temporary Data Logger for the TBSTCs is complete. The temporary Data Logger will be installed to monitor the temperature readings of 13 of the 26 Tank Bottom Thermocouples in support of SY-101 excavation testing.

9588 (WHC-SD-WM-DB–026) **T-Farm complex alarm upgrades.** Roberts, J.B. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 280p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005431. Source: OSTI; NTIS; GPO Dep.

The alarm and controls associated with the T, TX, and TY farms are located in the 242-T control room. The design data for replacement and upgrades of the alarm panels is in this document. This task was canceled previous to the 90% design review point.

9589 (WHC-SD-WM-DP–065) **Analysis and characterization of double shell tank 241-AP-108.** Miller, G.L. Westinghouse Hanford Co., Richland, WA (United States). 4 Oct 1994. 1444p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005169. Source: OSTI; NTIS; INIS; GPO Dep.

This document is the first part of a three-part report describing the analysis and characterization of double shell tank 241-AP-108 which is located at the Hanford Reservation.This document is the analytical laboratory data package entitled 'Analysis and Characterization of Double Shell Tank 241-AP-108' which contains a case sampling history, the sampling protocols, the analytical procedures, sampling and analysis quality assurance and quality control measures, and chemical analysis results for samples obtained from the tank.

9590 (WHC-SD-WM-DP–065-Add.1A) **Analyses and characterization of double shell tank.** Westinghouse Hanford Co., Richland, WA (United States). 4 Oct 1994. 289p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95007650. Source: OSTI; NTIS; INIS; GPO Dep.

Evaporator candidate feed from tank 241-AP-108 (108-AP) was sampled under prescribed protocol. Physical, inorganic, and radiochemical analyses were performed on tank 108-AP. Characterization of evaporator feed tank waste is needed primarily for an evaluation of its suitability to be safely processed through the evaporator. Such analyses should provide sufficient information regarding the waste composition to confidently determine whether constituent concentrations are within not only safe operating limits, but should also be relevant to functional limits for operation of the evaporator. Characterization of tank constituent concentrations should provide data which enable a prediction of where the types and amounts of environmentally hazardous waste are likely to occur in the evaporator product streams.

9591 (WHC-SD-WM-DP–067-Add.1A) **Analytical services: 222-S characterization of 242-A Evaporator Slurry, Campaign 94-1. Addendum 1A.** Westinghouse Hanford Co., Richland, WA (United States). 13 Sep 1994. 372p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95007413. Source: OSTI; NTIS; INIS; GPO Dep.

During the 242-A Evaporator's 94-1 campaign, five process samples were collected from the slurry stream for waste characterization. The five samples were collected over a 36 day time span, respectively on May 4, May 9, May 16, May 23, and June 9, 1994. Sample collections were performed per the protocol described in 242-A Evaporator Waste Analysis Plan, WHC-SD-WM-EV-060, Rev. 3 and in 242-A Evaporator Quality Assurance Project Plan, WHC-SD-WM-QAPP-009, Rev. 0. Slurry waste was characterized chemically and radiochemically by the Westinghouse Hanford Company, 222-S Laboratory as directed.

9592 (WHC-SD-WM-DP–078) **45-Day safety screen results for single shell tank 241-AP-106, liquid grab samples, riser 1, 30° and 150° in conjunction with evaporator campaign 95-1.** Miller, G.L. Westinghouse Hanford Co., Richland, WA (United States). 14 Dec 1994. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005648. Source: OSTI; NTIS; INIS; GPO Dep.

This is the 45-Day report for the fiscal year 1995 safety screening characterization of three liquid grab samples from single shell tank 241-AP-106. The required analyses are differential scanning calorimetry (DSC), thermal gravimetric analysis (TGA) and appearance (APPR). No analytes exceeded the notification limits, therefore, secondary analyses (RSST, cyanide, and hot persulfate-total organic carbon) were not required. Summary data tables 2, 3 and 4 present the appearance, DSC and TGA data, respectively. Total alpha analyses are not included in this report, because it is not required for liquid grab samples.

9593 (WHC-SD-WM-DP–082) **45 Day safety screen results for Tank 241-C-108 – Augers 94-012, 94-014 and 94-015.** Rice, A.D. Westinghouse Hanford Co., Richland, WA (United States). 31 Jan 1995. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006789. Source: OSTI; NTIS; INIS; GPO Dep.

Three auger samples from Tank C-108 (on the Ferrocyanide Watch List) were received by the 222-S laboratories. These samples underwent safety screening analysis (DSC, TGA, and Alpha Total) in accordance with reference below. No results exceeded the notification criteria. Due to the calculated depth of sludge at riser 7, two augers were used to sample the sludge. The first (94-AUG-012) was a ten inch auger, the second (94-AUG-014) was a 20 inch auger. One 20 inch auger (94-AUG-015) was used to sample the tank C-108 contents at riser 4. Results are compiled in this report.

9594 (WHC-SD-WM-ER–347) **Thermal analysis of tank 241-SY-101 to support structural assessment.** Beaver, T.R. Westinghouse Hanford Co., Richland, WA (United States). 14 Oct 1994. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002240. Source: OSTI; NTIS; GPO Dep.

This report documents a thermal model of tank 241-SY-101 and the surrounding soil column that was used to predict tank temperatures resulting from heating of the annulus ventilation air. Transient results from the model were input to a structural model of the tank for evaluation of the annulus heat-up event.

9595 (WHC-SD-WM-ER–360) **Tank characterization report for double-shell tank 241-AP-105.** DeLorenzo, D.S.; Simpson, B.C. Westinghouse Hanford Co., Richland, WA (United States). 13 Sep 1994. 104p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95001301. Source: OSTI; NTIS; INIS; GPO Dep.

Double-Shell Tank 241-AP-105 is a radioactive waste tank most recently sampled in March of 1993. Sampling and characterization of the waste in Tank 241-AP-105 contributes toward the fulfillment of Milestone M-44-05 of the Hanford Federal Facility Agreement and Consent Order (Ecology, EPA, and DOE, 1993). Characterization is also needed tot evaluate the waste's fitness for safe processing through an evaporator as part of an overall waste volume reduction program. Tank 241-AP-105, located in the 200 East Area AP Tank Farm, was constructed and went into service in 1986 as a dilute waste receiver tank; Tank 241AP-1 05 was considered as a candidate tank for the Grout Treatment Facility. With the cancellation of the Grout Program, the final disposal of the waste in will be as high- and low-level glass fractions. The tank has an operational capacity of 1,140,000 gallons, and currently contains 821,000 gallons of double-shell slurry feed. The waste is heterogeneous, although distinct layers do not exist. Waste has been removed periodically for processing and concentration through the 242-A Evaporator. The tank is not classified as a Watch List tank and is considered to be sound. There are no Unreviewed Safety Questions associated with Tank 241-AP-105 at this time. The waste in Tank 241-AP-105 exists as an aqueous solution of metallic salts and radionuclides, with limited amounts of organic complexants. The most prevalent soluble analytes include aluminum, potassium, sodium, hydroxide, carbonate, nitrate, and nitrite. The calculated pH is greater than the Resource Conservation and Recovery Act established limit of 12.5 for corrosivity. In addition, cadmium, chromium, and lead concentrations were found at levels greater than their regulatory thresholds. The major radionuclide constituent is ^{137}Cs, while the few organic complexants present include glycolate and oxalate. Approximately 60% of the waste by weight is water.

9596 (WHC-SD-WM-ER–373) **Dome load control and crane land path evaluation for Tank 241-SY-101 during hydrogen mitigation pump removal and installation.** Weis, M.P.; Lawler, D.M. Westinghouse Hanford Co., Richland, WA (United States). Aug 1994. 121p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002208. Source: OSTI; NTIS; GPO Dep.

This report revisits and consolidates two analyses previously performed for the installation of the Hydrogen Mitigation Pump (HMT) pump. The first report determines, as a function of the crane-imposed dome load, the point to which the crane can encroach

into the exclusion zone without exceeding the 50-ton limit. The second performs a load evaluation for the crane and the components in the load path (crane lift accessories and pump). In doing so, it determines the weakest component in the load path and the effect of this component on the allowable encroachment distance. Furthermore, the second report sets operational limits on the allowable load decrease (unload) during installation in the event the pump sticks in the riser. The analysis presented here expands on the latter subject by setting an operational limit on the amount of allowable load increase (overload) during pump removal in the event the pump sticks in the riser.

9597 (WHC-SD-WM-ER–383) **Uncertainties in the measured quantities of water leaving waste Tank 241-C-106 via the ventilation system.** Minteer, D.J. Westinghouse Hanford Co., Richland, WA (United States). 23 Jan 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006904. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this analysis is to estimate the uncertainty in the measured quantity of water which typically leaves Tank 241-C-106 via the ventilation system each month. Such measurements are essential for heat removal estimation and tank liquid level verification purposes. The uncertainty associated with the current, infrequent, manual method of measurement (involves various psychrometric and pressure measurements) is suspected to be unreasonably high. Thus, the possible reduction of this uncertainty using a continuous, automated method of measurement will also be estimated. There are three major conclusions as a result of this analysis: (1) the uncertainties associated with the current (infrequent, manual) method of measuring the water which typically leaves Tank 241-C-106 per month via the ventilation system are indeed quite high (80% to 120%); (2) given the current psychrometric and pressure measurement methods and any tank which loses considerable moisture through active ventilation, such as Tank 241-C-106, significant quantities of liquid can actually leak from the tank before a leak can be positively identified via liquid level measurement; (3) using improved (continuous, automated) methods of taking the psychrometric and pressure measurements, the uncertainty in the measured quantity of water leaving Tank 241-C-106 via the ventilation system can be reduced by approximately an order of magnitude.

9598 (WHC-SD-WM-ER–397) **CPAC optical moisture monitoring: Characterization of composition and physical effects on moisture determination Task 2A report.** Veltkamp, D.J. Westinghouse Hanford Co., Richland, WA (United States). 15 Nov 1994. 153p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005143. Source: OSTI; NTIS; INIS; GPO Dep.

The impact of particle size and chemical composition variations on determination of tank simulant moisture from near infrared (NIR) optical spectra are presented. This work shows particle size and chemical variations will impact moisture predictions from NIR spectra. However, the prediction errors can be minimized if calibration models are built with samples containing these variations as interferents. Prior work showed the NIR spectral region (1100 to 2500 nm) could be used to predict moisture content of BY-104 tank simulant with a standard error less of approximately 0.5 wt%. Particle size will increase moisture prediction error if calibration-models do not include the same particle size ranges as unknown samples. A combined particle size model with 0-420 $\times 10^{-6}$m, 420-841 $\times 10^{-6}$m, and 841 $\times 10^{-6}$ m-2 mm diameter particles predicted 0.59, 0.34 nd 0.23 wt% errors respectively for samples containing only these size ranges and 0.80 wt% error for a samples with all particle size ranges. Chemical composition would also increase moisture prediction error if calibration model samples chemically differ from unknown samples. For a BY-104 simulant, increases in NaOH, $NaAlO_2$, Na_2SiO_3, and Na_3PO_4 produced moisture predictions that were lower than the actual moisture levels while increases in $FE(NO_3)_3$, $Ca(NO_3)_2$, and $Mg(NO_3)_2$ resulted in a higher than actual moisture prediction. Systematic changes in the NIR spectra could be observed for these families of materials. When all of the composition variations were included in a single model, the model had a moisture prediction error of 1.41 wt% as compared to a 2.96 wt% error without model changes. This work shows a calibration model based on a single set of tightly controlled experimental conditions will tend to have somewhat larger prediction errors when applied to samples collected with variations outside of such conditions.

9599 (WHC-SD-WM-ETP–107) **Engineering task plan for the vapor monitor installation into 241-C-103 tank.** Hertelendy, N.A. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006895. Source: OSTI; NTIS; INIS; GPO Dep.

A vapor flow monitor is to be installed into the 241-C-103 tank's exhaust, just downstream of the HEPA filter. The flow monitor system includes the flow sensor, the baffle assembly, the signal conditioning and control electronics, and a chart recorder. The electronics package and the chart recorder are installed into a small, heated instrument cabinet that is mounted on the same steel pallet on which the flowmeter and the diffuser assembly is mounted. The flowmeter is connected to the HEPA filter with an unheated, un-insulated flex hose. An automatic drain, upstream of the flowmeter, is designed to automatically drain the condensate into an evaporating pan. The flowmeter is heated with a temperature controlled heater to avoid condensation.

9600 (WHC-SD-WM-ETP–119) **Engineering task plan and status of 241-S-106 Enraf level gauge wire break.** Moore, T.L. Westinghouse Hanford Co., Richland, WA (United States). Sep 1994. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95001038. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the findings of a task team which was formed which identified the need for short-term actions to re-establish tank waste level monitoring and to permanently address wire failure. The failed wire was removed and sent to Pacific Northwest Laboratory (PNL) for analysis. It was determined that the cause of the wire failure was due to chloride ion stress corrosion cracking (SCC) of the 316 stainless steel (SS) wire. Radiation induced breakdown of the polyvinyl chloride (PVC) riser liners is suspected to be the source of the chloride ions.

9601 (WHC-SD-WM-ETP–125) **Engineering task plan for Enraf Nonius densitometer assembly design.** Elfner, E.G. Westinghouse Hanford Co., Richland, WA (United States). 14 Dec 1994. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005218. Source: OSTI; NTIS; INIS; GPO Dep.

A supporting assembly will be designed to accommodate the Enraf Nonius densitometer. The design will include a sight glass or calibration chamber, a rinse spool assembly, and a ball valve. The assembly will be based on the Enraf Nonius liquid level gauge assembly.

9602 (WHC-SD-WM-ETP–135) **Engineering task plan for flammable gas atmosphere mobile color video camera systems.** Kohlman, E.H. Westinghouse Hanford Co., Richland, WA (United States). 25 Jan 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006906. Source: OSTI; NTIS; INIS; GPO Dep.

This Engineering Task Plan (ETP) describes the design, fabrication, assembly, and testing of the mobile video camera systems. The color video camera systems will be used to observe and record the activities within the vapor space of a tank on a limited exposure basis. The units will be fully mobile and designed for operation in the single-shell flammable gas producing tanks. The objective of this tank is to provide two mobile camera systems for use in flammable gas producing single-shell tanks (SSTs) for the Flammable Gas Tank Safety Program. The camera systems will provide observation, video recording, and monitoring of the activities that occur in the vapor space of applied tanks. The camera systems will be designed to be totally mobile, capable of deployment up to 6.1 meters into a 4 inch (minimum) riser.

9603 (WHC-SD-WM-ETP–138) **In situ sampling cart development engineering task plan.** DeFord, D.K. Westinghouse

Hanford Co., Richland, WA (United States). 6 Feb 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95007174. Source: OSTI; NTIS; INIS; GPO Dep.

This Engineering Task Plan (ETP) supports the development for facility use of the next generation in situ sampling system for characterization of tank vapors. In situ sampling refers to placing sample collection devices (primarily sorbent tubes) directly into the tank headspace, then drawing tank gases through the collection devices to obtain samples. The current in situ sampling system is functional but was not designed to provide the accurate flow measurement required by today's data quality objectives (DQOs) for vapor characterization. The new system will incorporate modern instrumentation to achieve much tighter control. The next generation system will be referred to in this ETP as the New In Situ System (NISS) or New System. The report describes the current sampling system and the modifications that are required for more accuracy.

9604 (WHC-SD-WM-EV–014-Rev.2) **Guide for preparing and maintaining generator group pollution prevention program documentation. Revision 2.** Floyd, B.C. Westinghouse Hanford Co., Richland, WA (United States). 30 Nov 1994. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004427. Source: OSTI; NTIS; GPO Dep.

The Hanford Pollution Prevention (P2) program is an organized, comprehensive, and continual effort to: systematically reduce the quantity and toxicity of hazardous, radioactive, mixed, and sanitary wastes; conserve resources; and prevent or minimize pollutant releases to all environmental media from all Hanford Site activities. The program has been developed to meet waste minimization and pollution Prevention public law requirements, federal and state regulations, and US Department of Energy (DOE) requirements. The Hanford P2 program is implemented through the sitewide, contractor, and generator group programs.

9605 (WHC-SD-WM-EV–053-Rev.2) **Double shell tank waste analysis plan.** Mulkey, C.H.; Jones, J.M. Westinghouse Hanford Co., Richland, WA (United States). 15 Dec 1994. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005079. Source: OSTI; NTIS; INIS; GPO Dep.

Waste analysis plan for the double shell tanks. SD-WM-EV-053 is Superseding SD-WM-EV-057.This document provides the plan for obtaining information needed for the safe waste handling and storage of waste in the Double Shell Tank Systems. In Particular it addresses analysis necessary to manage waste according to Washington Administrative Code 173-303 and Title 40, parts 264 and 265 of the Code of Federal Regulations.

9606 (WHC-SD-WM-EV–096) **LLBG mixed waste disposal facility leachate sampling and analysis plan.** Ambre, P.T. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006888. Source: OSTI; NTIS; INIS; GPO Dep.

Document addresses generator waste analysis requirements mandated by regulatory agencies and others for disposal of leachate from mixed waste landfills.

9607 (WHC-SD-WM-FDC–036) **Spare mitigation/retrieval mixer pumps.** Taylor, S. Westinghouse Hanford Co., Richland, WA (United States). 2 Feb 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006784. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the functional design criteria for design, analysis, fabrication, testing, and installation of a waste tank mixer pump. The mixer pump will be operated to eliminate the periodic releases of large quantities of flammable gas (e.g., hydrogen) from Hanford Site waste tanks and also to accommodate retrieval of tank waste.

9608 (WHC-SD-WM-FDC–041) **Gas characterization system functional design criteria.** Straalsund, E.K. Westinghouse Hanford Co., Richland, WA (United States). 5 Jan 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005228. Source: OSTI; NTIS; INIS; GPO Dep.

This is the functional design criteria for the gas characterization systems being placed on selected flammable gas watch-list tanks in support of the hydrogen mitigation tests.

9609 (WHC-SD-WM-FDC–042) **Liquid Observation Well (LOW) Functional Design.** Paul, B. Westinghouse Hanford Co., Richland, WA (United States). 4 Jan 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005601. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the Functional Design Criteria for installing Liquid Observation Wells (LOWS) into single-shell tanks containing either ferrocyanide or organic waste. The LOWs will be designed to accommodate the deployment of gamma, neutron, and electromagnetic induction probes and to interface with the existing tank structure and environment.

9610 (WHC-SD-WM-HIE–003) **Safety basis for the 241-AN-107 mixer pump installation and caustic addition.** Van Vleet, R.J. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Wastren, Inc., Idaho Falls, ID (United States). 5 Oct 1994. 84p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002281. Source: OSTI; NTIS; INIS; GPO Dep.

This safety Basis was prepared to determine whether or not the proposed activities of installing a 76 HP jet mixer pump and the addition of approximately 50,000 gallons of 19 M (50:50 wt %) aqueous caustic are within the safety envelope as described by Tank Farms (chapter six of WHC-SD-WM-ISB-001, Rev. 0). The safety basis covers the components, structures and systems for the caustic addition and mixer pump installation. These include: installation of the mixer pump and monitoring equipment; operation of the mixer pump, process monitoring equipment and caustic addition; the pump stand, caustic addition skid, the electrical skid, the video camera system and the two densitometers. Also covered is the removal and decontamination of the mixer pump and process monitoring system. Authority for this safety basis is WHC-IP-0842 (Waste Tank Administration). Section 15.9, Rev. 2 (Unreviewed Safety Questions) of WHC-IP-0842 requires that an evaluation be performed for all physical modifications.

9611 (WHC-SD-WM-MAR–004) **Integrated dynamic modeling and management system mission analysis.** Lee, A.K. Westinghouse Hanford Co., Richland, WA (United States). 28 Dec 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005103. Source: OSTI; NTIS; INIS; GPO Dep.

This document summarizes the mission analysis performed on the Integrated Dynamic Modeling and Management System (IDMMS). The IDMMS will be developed to provide the modeling and analysis capability required to understand the TWRS system behavior in terms of the identified TWRS performance measures. The IDMMS will be used to demonstrate in a verified and validated manner the satisfactory performance of the TWRS system configuration and assurance that the requirements have been satisfied.

9612 (WHC-SD-WM-OTP–169) **Operational test procedure for Bldg 241-A-701 air compressor.** Desantis, G.N. Westinghouse Hanford Co., Richland, WA (United States). 1 Feb 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006788. Source: OSTI; NTIS; INIS; GPO Dep.

This document is an Operability Test Procedure (OTP) which will verify and record that the 241-A-701 air compressor and associated equipment operates within their intended design parameters. The activities defined in this OTP will be performed to ensure the daily operation of the new compressed air system can be reliable and efficient. The Compressed Air System (CAS) for 241-A-701 supplies process and instrument air to the A, AX, AY, and AZ tank farms. The primary use of the CAS is for tank farms instrumentation, air operated valves, and air lift circulators.

9613 (WHC-SD-WM-PC–002-Rev.6) **Tank farms essential and support drawing plan. Revision 6.** Salazar, B.E. Westinghouse Hanford Co., Richland, WA (United States). 5 Oct 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002211. Source: OSTI; NTIS; INIS; GPO Dep.

This supporting document provides a detailed list of the essential and support drawings selected for the tank farm(s) and associated facilities.

9614 (WHC-SD-WM-PICD–005) **Interface control document between Analytical Services and Solid Waste Disposal Division.** Venetz, T.J. Westinghouse Hanford Co., Richland, WA (United States). 30 Jan 1995. 88p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006785. Source: OSTI; NTIS; INIS; GPO Dep.

This interface control document (ICD) between Analytical Services and Solid Waste Disposal (SWD) establishes a baseline description of the support needed and the wastes that will require management as part of the interface between the two divisions. It is important that each division has a clear understanding of the other division's expectations regarding levels and type of support needed. This ICD deals with the waste sampling support needed by SWD and the waste generated by the specified analytical laboratories. The baseline description of wastes includes waste volumes, characteristics and shipping schedules, which will be used to plan the proper support requirements. The laboratories included in this document are 222-S Laboratory Facility, the Waste Sampling and Characterization Facility (WSCF) and the Chemical Engineering Laboratory. These three facilities provide support to the entire site and are not associated with one major program/facility. The laboratories associated with major facilities or programs such as Engineering/Environmental Development Laboratory at K Basins Operation are not within the scope of this document.

9615 (WHC-SD-WM-PICD–006) **Interface control document between PFP Transition Project and Solid Waste Disposal Division.** Venetz, T.J. Westinghouse Hanford Co., Richland, WA (United States). 13 Jan 1995. 119p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005977. Source: OSTI; NTIS; INIS; GPO Dep.

This interface control document between Plutonium Finishing Plant (PFP) Transition Project and Solid Waste Disposal (SWD) establishes the functional responsibilities of each division where interface exist between the two divisions. The document includes waste volumes and timing for use in planning the proper waste management capabilities.

9616 (WHC-SD-WM-PLN–055-Rev.2) **Fiscal year 1995 work scope for the 222-S, WSCF, 325, and Litco Laboratories.** Thomas, C.L. Westinghouse Hanford Co., Richland, WA (United States). 29 Dec 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005636. Source: OSTI; NTIS; INIS; GPO Dep.

This report is intended to establish a baseline for the sample analyses to be completed by the 222-S, WSCF, 325, and LITCO laboratories during FY 1995. These analyses are intended to support the Hanford Environmental Restoration. The work covered by this report focuses on 5 Sample Categories (Environmental Remediation, Liquid Effluents, Solid Waste, TWRS, and Process Support).

9617 (WHC-SD-WM-PLN–096) **Systems engineering implementation plan for the liquid effluents services program.** Lowe, S.S. Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006896. Source: OSTI; NTIS; INIS; GPO Dep.

A graded approach is being taken by the Liquid Effluents Services Program in implementing systems engineering because of the advanced state of the program. The approach is cost-effective and takes credit for related work already completed, yet retains the benefits of systems engineering. This plan describes how the Liquid Effluents Services Program will implement systems engineering so there is a common understanding. Systems engineering work to be performed and the products of that work are identified. The relation to the current planning process and integration with the sitewide systems engineering effort is described.

9618 (WHC-SD-WM-RPT–099-Rev.1) **Compliance matrix for the Mixed Waste Disposal Facilities, Trenches 31 and 34, burial ground 218-W-5. Revision 1.** Carlyle, D.W. Westinghouse Hanford Co., Richland, WA (United States). 30 Dec 1994. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005135. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the Trench 31 and 34 Mixed Waste Disposal Facility Compliance Matrix is to provide objective evidence of implementation of all regulatory and procedural–institutional requirements for the disposal facilities. This matrix provides a listing of the individual regulatory and procedural–institutional requirements that were addressed. Subject matter experts reviewed pertinent documents that had direct or indirect impact on the facility. Those found to be applicable were so noted and listed in Appendix A. Subject matter experts then extracted individual requirements from the documents deemed applicable and listed them in the matrix tables. The results of this effort are documented in Appendix B. The implementing compliance documentation for WHC-CM manuals is not included in Appendix B because these are, by definition, implementing documents.

9619 (WHC-SD-WM-RPT–105) **Selection of ENRAF gauge wire material compatible with the Hanford waste tank environment.** Anantatmula, R.P. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005673. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the selection of the wire material that will replace the 316 SS wire in the ENRAF level indicators.

9620 (WHC-SD-WM-SAD–016-Rev.2) **Safety evaluation for adding water to tank 101-SY.** Clinton, R. Westinghouse Hanford Co., Richland, WA (United States). 9 Dec 1994. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005437. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides a new water limit for Tank 241-SY-101. The original limit was set at 9600 gallons. The new limit is now 20,000 gallons. There are various activities that require the use of additional water to the tank. The main activity is the removal of the temporary mixer pump. This requires a large amount of water which will exceed the original limit. Also, other activities such as flushing, adding a viscometer, and adding a void fraction meter requires additional water. The new limit safely incorporates these activities and allows room for more future activities.

9621 (WHC-SD-WM-SDD–024) **242-A evaporator vacuum condenser system.** Smith, V.A. Westinghouse Hanford Co., Richland, WA (United States). 28 Sep 1994. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005287. Source: OSTI; NTIS; INIS; GPO Dep.

This document is written for the 242-A evaporator vacuum condenser system (VCS), describing its purpose and operation within the evaporator. The document establishes the operating parameters specifying pressure, temperature, flow rates, interlock safety features and interfacing sub-systems to support its operation.

9622 (WHC-SD-WM-SDD–043) **SY101 in situ viscometer instrument system design description.** Pearce, K.L.; Stokes, T.I.; Vagelatos, N. Westinghouse Hanford Co., Richland, WA (United States). 18 Aug 1994. 476p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005684. Source: OSTI; NTIS; INIS; GPO Dep.

This documents the design and description of the in situ viscometer, developed for the hydrogen mitigation project.

9623 (WHC-SD-WM-SDD–048) **System design description for Waste Information and Control System.** Harris, R.R. Westinghouse Hanford Co., Richland, WA (United States). 16 Dec 1994. 176p. Sponsored by USDOE, Washington, DC (United States).

DOE Contract AC06-87RL10930. Order Number DE95005225. Source: OSTI; NTIS; INIS; GPO Dep.

The Westinghouse Hanford Company (WHC) Hazardous Material Control Group (HMC) of the 222-S Laboratory has requested the development of a system to help resolve many of the difficulties associated with tracking and data collection of containers and drums of waste. This system has been identified as the Waste Information and Control System (WICS). WICS shall partially automate the procedure for acquisition, tracking and reporting of the container, drum, and waste data that is currently manually processed. The WICS project shall use handheld computer units (HCU) to collect laboratory data, a local database with an user friendly interface to import the laboratory data from the HCUs, and barcode technology with associated software and operational procedures. After the container, drum, and waste data has been collected and verified, WICS shall be manipulated to provide informal reports containing data required to properly document waste disposal. 8 refs, 82 figs, 69 tabs.

9624 (WHC-SD-WM-SDD–055) **Standard-B Hydrogen Monitoring System, system design description.** Schneider, T.C. Westinghouse Hanford Co., Richland, WA (United States). 16 Jan 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006652. Source: OSTI; NTIS; INIS; GPO Dep.

During most of the year, it is assumed that the vapor in the 177 radioactive waste tanks on the Hanford Project site contain a uniform mixture of gases. Several of these waste tanks (currently twenty five, 6 Double Shell Tanks and 19 Single Shell Tanks) were identified as having the potential for the buildup of gases to a flammable level. An active ventilation system in the Double Shell Tanks and a passive ventilation system in the Single Shell Tanks provides a method of expelling gases from the tanks. A gas release from a tank causes a temporary rise in the tank pressure, and a potential for increased concentration of hydrogen gas in the vapor space. The gas is released via the ventilation systems until a uniform gas mixture in the vapor space is once again achieved. This document describes the design of the Standard-B Hydrogen Monitoring System, (SHMS) and its components as it differs from the original SHMS. The differences are derived from changes made to improve the system performance but not implemented in all the installed enclosures.

9625 (WHC-SD-WM-SP–006) **Testing and development strategy for the tank waste remediation system.** Reddick, G.W. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005619. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides a strategy for performing radioactive (hot) and nonradioactive testing to support processing tank waste. It evaluates the need for hot pilot plant(s) to support pretreatment and other processing functions and presents a strategy for performing hot test work. A strategy also is provided for nonradioactive process and equipment testing. The testing strategy supports design, construction, startup, and operation of Tank Waste Remediation System (TWRS) facilities.

9626 (WHC-SD-WM-TA–159) **Alternative concepts for treatment and disposal of Hanford site high-level waste in tanks.** Claghorn, R.D.; Powell, W.J. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 122p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005282. Source: OSTI; NTIS; INIS; GPO Dep.

Some innovative approaches have recently been proposed that may have significant schedule, cost, or environmental advantages which could improve the current HLW program strategy. Three general categories of alternative concepts are now under consideration: (1) process/product alternatives, (2) facility layout options, and (3) contracting strategies. This report compares the alternate approaches to the current program baseline to illustrate their potential significance and to identify the risks associated with each approach.

9627 (WHC-SD-WM-TC–005) **Test procedure for use of the shear vane in tanks 103-SY, 103-AN, and 103-AW.** LeClair, M.D.; Waters, E. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 155p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005290. Source: OSTI; NTIS; INIS; GPO Dep.

This is a record copy of a test procedure for application of the full-scale shear vane to underground waste tanks at Hanford. The introduction of the report provides background information on the development and proof-testing of the shear vane, as well as information about its current location. The document was originally prepared in 1988, and the work as shelved temporarily for lack of funds. Activities to utilize the shear vane will be expedited by use of this information.

9628 (WHC-SD-WM-TI–363) **Descriptions and diagrams of the primary and annulus ventilation systems of the double-shell tank farms as of January 1988.** Blackman, A.E.; Waters, E.D. Westinghouse Hanford Co., Richland, WA (United States). 28 Dec 1994. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005597. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a compilation of information describing the ventilation systems of the Double-Shell Tank farms (214-AN, -AP, -AW, -AW, -AY, -AZ, and -SY). A general description of the primary tank and annulus ventilation systems is given along with specific information on the high efficiency particulate air (HEPA) filters, condensers, preheaters, exhaust fans, and piping. This information is considered to be current as of January 1988. 38 refs, 20 figs, 30 tabs.

9629 (WHC-SD-WM-TI–656-Rev.1) **Safety evaluation of interim stabilization of non-stabilized single-shell watch list tanks.** Stahl, S.M. Westinghouse Hanford Co., Richland, WA (United States). 30 Dec 1994. 101p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005216. Source: OSTI; NTIS; INIS; GPO Dep.

The report provides a summation of the status of safety issues associated with interim stabilization of Watch List SSTs (organic, ferrocyanide, and flammable gas), as extracted from recent safety analyses, including the Tank Farms Accelerated Safety Analysis efforts.

9630 (WHC-SD-WM-TI–658) **Statistical characterization report for Single-Shell Tank 241-T-104.** Cromar, R.D.; Wilmarth, S.R.; Jensen, L. Westinghouse Hanford Co., Richland, WA (United States). 23 Sep 1994. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95001034. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains the results of the statistical analysis of data from two core samples obtained from single-shell tank 241-T-104 (T-104). Section 2.0 contains a description of the core samples and the chemical analyses performed on the core samples. Section 3.0 contains mean concentration estimates and associated 95% confidence intervals (CIs) on the mean for each of the analytes found in the core composite samples. Section 4.0 contains estimates of the spatial variability (variability between cores) and estimates of the analytical variability from the core composite data. Two types of analytical variability were estimated from the core composite data: (1) sample composite variability (variability between composite samples within the same core) and (2) analytical measurement variability (variability between the primary and duplicate analyses within each core composite sample). Estimates of the analytical measurement variability were used as the reference value to test the significance of the spatial and sample composite variability. Spatial variability was significantly different from zero for 32 out of 80 analytes. The sample composite variance was significantly different from zero for 18 out of the 80 analytes.

9631 (WHC-SD-WM-TI–665) **Soil load above Hanford waste storage tanks (2 volumes).** Pianka, E.W. (Advent Engineering Services, Inc., San Ramon, CA (United States)). Westinghouse Hanford Co., Richland, WA (United States). 25 Jan 1995. 184p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006902. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a compilation of work performed as part of the Dome Load Control Project in 1994. Section 2 contains the calculations of the weight of the soil over the tank dome for each of the 75-feet-diameter waste-storage tanks located at the Hanford Site. The chosen soil specific weight and soil depth measured at the apex of the dome crown are the same as those used in the primary analysis that qualified the design. Section 3 provides reference dimensions for each of the tank farm sites. The reference dimensions spatially orient the tanks and provide an outer diameter for each tank. Section 4 summarizes the available soil surface elevation data. It also provides examples of the calculations performed to establish the present soil elevation estimates. The survey data and other data sources from which the elevation data has been obtained are printed separately in Volume 2 of this Supporting Document. Section 5 contains tables that provide an overall summary of the present status of dome loads. Tables summarizing the load state corresponding to the soil depth and soil specific weight for the original qualification analysis, the gravity load requalification for soil depth and soil specific weight greater than the expected actual values, and a best estimate condition of soil depth and specific weight are presented for the Double-Shell Tanks. For the Single-Shell Tanks, only the original qualification analysis is available; thus, the tabulated results are for this case only. Section 6 provides a brief overview of past analysis and testing results that given an indication of the load capacity of the waste storage tanks that corresponds to a condition approaching ultimate failure of the tank. 31 refs.

9632 (WHC-SD-WM-TI–667) **Preliminary flowsheet: Ion exchange process for the separation of cesium from Hanford tank waste using Duolite™ CS-100 resin.** Eager, K.M.; Penwell, D.L.; Knutson, B.J. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 174p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005281. Source: OSTI; NTIS; INIS; GPO Dep.

This preliminary flowsheet document describes an ion exchange process which uses Duolite™ CS-100 resin to remove cesium from Hanford Tank waste. The flowsheet describes one possible equipment configuration, and contains mass balances based on that configuration with feeds of Neutralized Current Acid Waste, and Double Shell Slurry Feed. Process alternatives, unresolved issues, and development needs are discussed which relate to the process.

9633 (WHC-SD-WM-TI–674) **Number of core samples: Mean concentrations and confidence intervals.** Jensen, L. (Westinghouse Hanford Co., Richland, WA (United States)); Cromar, R.D.; Wilmarth, S.R.; Heasler, P.G. Westinghouse Hanford Co., Richland, WA (United States). 24 Jan 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006908. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides estimates of how well the mean concentration of analytes are known as a function of the number of core samples, composite samples, and replicate analyses. The estimates are based upon core composite data from nine recently sampled single-shell tanks. The results can be used when determining the number of core samples needed to "characterize" the waste from similar single-shell tanks. A standard way of expressing uncertainty in the estimate of a mean is with a 95% confidence interval (CI). The authors investigate how the width of a 95% CI on the mean concentration decreases as the number of observations increase. Specifically, the tables and figures show how the relative half-width (RHW) of a 95% CI decreases as the number of core samples increases. The RHW of a CI is a unit-less measure of uncertainty. The general conclusions are as follows: (1) the RHW decreases dramatically as the number of core samples is increased, the decrease is much smaller when the number of composited samples or the number of replicate analyses are increase; (2) if the mean concentration of an analyte needs to be estimated with a small RHW, then a large number of core samples is required. The estimated number of core samples given in the tables and figures were determined by specifying different sizes of the RHW. Four nominal sizes were examined: 10%, 25%, 50%, and 100% of the observed mean concentration. For a majority of analytes the number of core samples required to achieve an accuracy within 10% of the mean concentration is extremely large. In many cases, however, two or three core samples is sufficient to achieve a RHW of approximately 50 to 100%. Because many of the analytes in the data have small concentrations, this level of accuracy may be satisfactory for some applications.

9634 (WHC-SD-WM-TI–682) **Results of gas monitoring of double-shell flammable gas watch list tanks.** Wilkins, N.E. Westinghouse Hanford Co., Richland, WA (United States). 19 Jan 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006894. Source: OSTI; NTIS; INIS; GPO Dep.

Tanks 103-SY; 101-AW; 103-, 104-, and 105-AN are on the Flammable Gas Watch List. Recently, standard hydrogen monitoring system (SHMS) cabinets have been installed in the vent header of each of these tanks. Grab samples have been taken once per week, and a gas chromatograph was installed on tank 104-AN as a field test. The data that have been collected since gas monitoring began on these tanks are summarized in this document.

9635 (WHC-SD-WM-TP–165) **Liquid Effluent Monitoring Information System test plans release 1.2.** Adams, R.T. Westinghouse Hanford Co., Richland, WA (United States). 11 Oct 1994. 378p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002241. Source: OSTI; NTIS; INIS; GPO Dep.

The Liquid Effluent Monitoring Information System (LEMIS) is being developed as the organized information repository facility in support of the liquid effluent monitoring requirements of the Tri-Party Agreement. It is necessary to provide an automated repository into which the results from liquid effluent sampling will be placed. This repository must provide for effective retention, review, and retrieval of selected sample data by authorized persons and organizations. This System Architecture document is the aggregation of the DMR P+ methodology project management deliverables. Together they represent a description of the project and its plan through four Releases, corresponding to the definition and prioritization of requirements defined by the user.

9636 (WHC-SD-WM-TP–200) **Tank 241-T-111 tank characterization plan.** Homi, C.S. Westinghouse Hanford Co., Richland, WA (United States). 10 Jan 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006826. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, Oak Ridge National Laboratory, and PNL tank vapor program. The scope of this plan is to provide guidance for the sampling and analysis of vapor samples from tank 241-T-111.

9637 (WHC-SD-WM-TP–207-Rev.1) **Tank 241-C-103 tank characterization plan. Revision 1.** Schreiber, R.D. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Los Alamos Technical Associates, Inc., Kennewick, WA (United States). 24 Jan 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006890. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, WHC 222-S Laboratory, and PNL 325 Analytical Chemistry Laboratory. The scope of this plan is to provide guidance for the sampling and analysis of samples from tank 241-C-103.

9638 (WHC-SD-WM-TP–217-Rev.1) **Tank 241-BY-106 tank characterization plan.** Schreiber, R.D. Westinghouse Hanford Co., Richland, WA (United States). 24 Jan 1995. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006897. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, PNL 325 Analytical Chemistry Laboratory, and WHC 222-S Laboratory. The scope of this plan is to provide guidance for the sampling and analysis of samples for tank 241-BY-106.

9639 (WHC-SD-WM-TP–218-Rev.1) **Tank 241-BY-105 tank characterization plan.** Schreiber, R.D. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006777. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, PNL 325 Analytical Chemistry Laboratory, and WHC 222-S Laboratory. The scope of this plan is to provide guidance for the sampling and analysis of samples for tank 241-BY-105.

9640 (WHC-SD-WM-TP–219-Rev.2) **Engineering test plan for Tank 241-SY-101 in situ viscometer.** Sobocinski, R.G.; Stokes, T.I.; Pearce, K.L. Westinghouse Hanford Co., Richland, WA (United States). Nov 1994. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005146. Source: OSTI; NTIS; INIS; GPO Dep.

To obtain in situ measurements of the rheological properties within tank 241-SY-101, this document will implement the test strategy defined in PNLMIT-041994, acquisition and Reduction of Data Obtained in Tank SY-101 with the Ball Rheometer. Instructions for all sequences are defined within the procedure. All safety requirements as defined in LA-UR-92-3196, A Safety Assessment for Proposed Mixing Operations to Mitigate Episodic Gas Releases in Tank 241-101-SY have been implemented into this procedure.

9641 (WHC-SD-WM-TP–227-Rev.1) **Tank 241-AX-102 tank characterization plan.** Schreiber, R.D. Westinghouse Hanford Co., Richland, WA (United States). 24 Jan 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006891. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, WHC 222-S Laboratory, and PNL 325 Analytical Chemistry Laboratory. The scope of this plan is to provide guidance for the sampling and analysis of samples from tank 241-AX-102.

9642 (WHC-SD-WM-TP–250) **Tank 241-B-103 tank characterization plan.** Carpenter, B.C. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Los Alamos Technical Associates, Inc., Kennewick, WA (United States). 23 Jan 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006905. Source: OSTI; NTIS; INIS; GPO Dep.

The Defense Nuclear Facilities Safety Board (DNFSB) has advised the US Department of Energy (DOE) to concentrate the near-term sampling and analysis activities on identification and resolution of safety issues. The data quality objective (DQO) process was chosen as a tool to be used to identify sampling and analytical needs for the resolution of safety issues. As a result, a revision in the Federal Facility Agreement and Consent Order (Tri-Party Agreement or TPA) milestone M-44-00 has been made, which states that "A Tank Characterization Plan (TCP) will also be developed for each double-shell tank (DST) and single-shell tank (SST) using the DQO process... Development of TCPs by the DQO process is intended to allow users (e.g., Hanford Facility user groups, regulators) to ensure their needs will be met and that resources are devoted to gaining only necessary information." This document satisfies that requirement for Tank 241-B-103 (B-103) sampling activities. Tank B-103 was placed on the Organic Watch List in January 1991 due to review of TRAC data that predicts a TOC content of 3.3 dry weight percent. The tank was classified as an assumed leaker of approximately 30,280 liters (8,000 gallons) in 1978 and declared inactive. Tank B-103 is passively ventilated with interim stabilization and intrusion prevention measures completed in 1985.

9643 (WHC-SD-WM-TP–254) **Tank 241-C-111 headspace gas and vapor sample results - August 1993 samples.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 14 Nov 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005475. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-C-111 is on the ferrocyanide Watch List. Gas and vapor samples were collected to assure safe conditions before planned intrusive work was performed. Sample analyses showed that hydrogen is about ten times higher in the tank headspace than in ambient air. Nitrous oxide is about sixty times higher than ambient levels. The hydrogen cyanide concentration was below 0.04 ppbv, and the average NO_x concentration was 8.6 ppmv.

9644 (WHC-SD-WM-TP–266) **Test plan for slow speed core sampling envelope test.** Ralston, G.L. Westinghouse Hanford Co., Richland, WA (United States). 27 Dec 1994. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95003944. Source: OSTI; NTIS; INIS; GPO Dep.

This plan describes the testing parameters used to establish an operating envelope for slow rotation core sampling without purge gas for cooling.

9645 (WHC-SD-WM-TP–268) **241-TX acoustic monitoring 114TX tank waste.** Hurley, J.V. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005639. Source: OSTI; NTIS; INIS; GPO Dep.

This test will involve raising and lowering a sound transmitter in one low and receiver hydrophones in another low at 0.5 ft. intervals over a 12 ft. depth, which is the depth of the waste. The soundings are recorded by equipment outside the tank farm fence.

9646 (WHC-SD-WM-TP–285) **Tank 241-C-101 tank characterization plan.** Schreiber, R.D. Westinghouse Hanford Co., Richland, WA (United States). 6 Dec 1994. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005132. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, WHC 222-S Laboratory, and PNL 325 Analytical Chemistry Laboratory. The scope of this plan is to provide guidance for the sampling and analysis of samples from tank 241-C-101.

9647 (WHC-SD-WM-TP–286-Rev.1) **Tank 241-AP-107 tank characterization plan. Revision 1.** Schreiber, R.D. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Los Alamos Technical Associates, Inc., Kennewick, WA (United States). 20 Jan 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005978. Source: OSTI; NTIS; INIS; GPO Dep.

Defense Nuclear Facilities Safety Board has directed the DOE to concentrate ear-term sampling and analysis activities on identification and resolution of issues (Conway 1993). The Data Quality Objective (DQO) process was chosen as a tool to be used in the resolution of safety issues. As a result, a revision in the Federal Facilities Agreement and Consent Order (Tri-Party Agreement) milestone M-44-00 has been made, which states that "A Tank Characterization Plan (TCP) will be developed for each double-shell tank (DST) and single-shell tank (SST) using the DQO process; Development of TCPs by the DQO process is intended to allow users (e.g., Hanford Facility user groups, regulators) to ensure their needs will be met and that resources are devoted to gaining only necessary information." This document satisfies that requirement for the tank 241-AP-107 (AP-107).

9648 (WHC-SD-WM-TP–288) **Tank 241-U-103 tank characterization plan.** Carpenter, B.C. Westinghouse Hanford Co., Richland, WA (United States). 24 Jan 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006898. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, Oak Ridge National Laboratory and PNL tank vapor program. The scope of this plan is to provide guidance for the sampling and analysis of vapor samples from tank 241-U-103.

9649 (WHC-SD-WM-TP–290) **Tank 241-C-107 tank characterization plan.** Schreiber, R.D. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Los Alamos Technical Associates, Inc.,

Kennewick, WA (United States). 6 Feb 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95007175. Source: OSTI; NTIS; INIS; GPO Dep.

The Defense Nuclear Facilities Safety Board (DNFSB) has advised the US Department of Energy (DOE) to concentrate the near-term sampling and analysis activities on identification and resolution of safety issues. The data quality objective (DQO) process was chosen as a tool to be used to identify sampling and analytical needs for the resolution of safety issues. As a result, a revision in the Federal Facility Agreement and Consent Order (Tri-Party Agreement or TPA) milestone M-44-00 has been made, which states that "A Tank Characterization Plan (TCP) will also be developed for each double-shell tank (DST) and single-shell tank (SST) using the DQO process... Development of TCPs by the DQO process is intended to allow users (e.g., Hanford Facility user groups, regulators) to ensure their needs will be met and that resources are devoted to gaining only necessary information." This document satisfies that requirement for the Tank 241-C-107 (C-107) sampling activities. Currently tank C-107 is categorized as a sound, low-heat load tank with partial isolation completed in December 1982. The tank is awaiting stabilization. Tank C-107 is expected to contain three primary layers of waste. The bottom layer should contain a mixture of the following wastes: ion exchange, concentrated phosphate waste from N-Reactor, Hanford Lab Operations, strontium semi-works, Battelle Northwest, 1C, TBP waste, cladding waste, and the hot semi-works. The middle layer should contain strontium recovery supernate. The upper layer should consist of non-complexed waste.

9650 (WHC-SD-WM-TP–294) **Test plan for qualification of the S-type fiberglass materials for use as the liquid observation well casing.** Parra, S.A. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005604. Source: OSTI; NTIS; INIS; GPO Dep.

This test plan presents the guidelines and requirements for acceptance of the S-type fiberglass material for use as the liquid observation well casing material. The plan for evaluating the physical properties of the candidate fiberglass materials when subjected to radiation, corrosive chemicals, and high temperatures typically found in the waste tanks are outlined. The tests also include tube connection evaluations. Finally, the test plan identifies the participants, their responsibilities, and the schedule for completion of the work.

9651 (WHC-SD-WM-TP–295) **Tank 241-T-107 tank characterization plan.** Homi, C.S. Westinghouse Hanford Co., Richland, WA (United States). 5 Jan 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005637. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, Oak Ridge National Laboratory, and PNL tank vapor program. The scope of this plan is to provide guidance for the sampling and analysis of vapor samples from tank 241-T-107.

9652 (WHC-SD-WM-TP–296) **Tank 241-BX-104 tank characterization plan.** Carpenter, B.C. Westinghouse Hanford Co., Richland, WA (United States). 14 Dec 1994. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005070. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, Oak Ridge National Laboratory, and PNL tank vapor program. The scope of this plan is to provide guidance for the sampling and analysis of vapor samples from tank 241-BX-104.

9653 (WHC-SD-WM-TP–302) **Tank 241-B-112 tank characterization plan.** Schreiber, R.D. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Los Alamos Technical Associates, Inc., Kennewick, WA (United States). 6 Feb 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95007180. Source: OSTI; NTIS; INIS; GPO Dep.

The Defense Nuclear Facilities Safety Board (DNFSB) has advised the US Department of Energy (DOE) to concentrate the near-term sampling and analysis activities on identification and resolution of safety issues. The data quality objective (DQO) process was chosen as a tool to be used to identify sampling and analytical needs for the resolution of safety issues. As a result, a revision in the Federal Facility Agreement and Consent Order (Tri-Party Agreement or TPA) milestone M-44-00 has been made, which states that "A Tank Characterization Plan (TCP) will also be developed for each double-shell tank (DST) and single-shell tank (SST) using the DQO process... Development of TCPs by the DQO process is intended to allow users (e.g., Hanford Facility user groups, regulators) to ensure their needs will be met and that resources are devoted to gaining only necessary information." This document satisfies that requirement for tank 241-B-112 (B-112). Tank B-112 is currently a non-Watch List tank; therefore, the only applicable DQO as of January 1995 is the Tank Safety Screening Data Quality Objective, which is described below. Tank B-112 is expected to have three primary layers. A bottom layer of sludge consisting of second-cycle waste, followed by a layer of BY saltcake and a top layer of supernate.

9654 (WHC-SD-WM-TPI–016-Rev.3) **Level maintenance for Tank 101-SY mitigation-by-mixing test.** Sobocinski, R.G. Westinghouse Hanford Co., Richland, WA (United States). 16 Nov 1994. 95p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005145. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the procedure to be followed to implement the requirements of the Mixer Pump Long-Term Operations Plan for Tank 241-SY-101 Mitigation, WHC-SD-WM-PLN-081. The test is divided into 2 distinct sequences, named Single Position Pump Run and Tank Sweep. Instructions for all sequences are defined within the procedure. All safety requirements as defined in LA-UR-92-3196, A Safety Assessment for Proposed Mixing Operations to Mitigate Episodic Gas Releases in Tank 241-101-SY have been implemented into this procedure.

9655 (WHC-SD-WM-TRP–211) **Mitigation of hydrogen by oxidation using nitrous oxide and noble metal catalysts.** Britton, M.D. Westinghouse Hanford Co., Richland, WA (United States). 19 Jan 1995. 110p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005979. Source: OSTI; NTIS; INIS; GPO Dep.

This test studied the ability of a blend of nuclear-grade, noble-metal catalysts to catalyze a hydrogen/nitrous oxide reaction in an effort to mitigate a potential hydrogen (H_2) gas buildup in the Hanford Site Grout Disposal Facility. For gases having H_2 and a stoichiometric excess of either nitrous oxide or oxygen, the catalyst blend can effectively catalyze the H_2 oxidation reaction at a rate exceeding 380 μmoles of H_2 per hour per gram of catalyst (μmol/h/g) and leave the gas with less than a 0.15 residual H_2 Concentration. This holds true in gases with up to 2.25% water vapor and 0.1% methane. This should also hold true for gases with up to 0.1% carbon monoxide (CO) but only until the catalyst is exposed to enough CO to block the catalytic sites and stop the reaction. Gases with ammonia up to 1% may be slightly inhibited but can have reaction rates greater than 250 μmol/h/g with less than a 0.20% residual H_2 concentration. The mechanism for CO poisoning of the catalyst is the chemisorption of CO to the active catalyst sites. The CO sorption capacity (SC) of the catalyst is the total amount of CO that the catalyst will chemisorb. The average SC for virgin catalyst was determined to be 19.3 $\pm$ 2.0 μmoles of CO chemisorbed to each gram of catalyst (μmol/g). The average SC for catalyst regenerated with air was 17.3 $\pm$ 1.9 μmol/g.

9656 (WHC-SD-WM-TRP–212) **Hydrogen recombiner catalyst test supporting data.** Britton, M.D. Westinghouse Hanford Co., Richland, WA (United States). 19 Jan 1995. 314p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006761. Source: OSTI; NTIS; INIS; GPO Dep.

This is a data package supporting the Hydrogen Recombiner Catalyst Performance and Carbon Monoxide Sorption Capacity Test Report, WHC-SD-WM-TRP-211, Rev 0. This report contains 10 appendices which consist of the following: Mass spectrometer analysis reports: HRC samples 93-001 through 93-157; Gas spectrometry analysis reports: HRC samples 93-141 through 93-658; Mass spectrometer procedure PNL-MA-299 ALO-284; Alternate analytical method for ammonia and water vapor; Sample log sheets; Job Safety analysis; Certificate of mixture analysis for feed gases; Flow controller calibration check; Westinghouse Standards Laboratory report on Bois flow calibrator; and Sorption capacity test data, tables, and graphs.

9657 (WHC-SD-WM-UM–019) **The grout/glass performance assessment code system (GPACS) with verification and benchmarking.** Piepho, M.G.; Sutherland, W.H.; Rittmann, P.D. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 138p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006889. Source: OSTI; NTIS; INIS; GPO Dep.

GPACS is a computer code system for calculating water flow (unsaturated or saturated), solute transport, and human doses due to the slow release of contaminants from a waste form (in particular grout or glass) through an engineered system and through a vadose zone to an aquifer, well and river. This dual-purpose document is intended to serve as a user's guide and verification/benchmark document for the Grout/Glass Performance Assessment Code system (GPACS). GPACS can be used for low-level-waste (LLW) Glass Performance Assessment and many other applications including other low-level-waste performance assessments and risk assessments. Based on all the cses presented, GPACS is adequate (verified) for calculating water flow and contaminant transport in unsaturated-zone sediments and for calculating human doses via the groundwater pathway.

9658 (WHC-SD-WM-UM–029) **241-A evaporator flowsheet users manual.** Larrick, A.P. Westinghouse Hanford Co., Richland, WA (United States). 22 Dec 1994. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005147. Source: OSTI; NTIS; INIS; GPO Dep.

This supporting document presents a description of the 242-A Evaporator flowsheet. Material balances are calculated for feed, slurry, and effluent streams based on input data for the feed stream.

9659 (WHC-SD-WM-VI–011) **Test plan for evaluation of plasma melter technology for vitrification of high-sodium content low-level radioactive liquid wastes.** McLaughlin, D.F.; Lahoda, E.J.; Gass, W.R.; D'Amico, N. (ed.). Westinghouse Hanford Co., Richland, WA (United States). 20 Oct 1994. 84p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005434. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides a test plan for the conduct of plasma arc vitrification testing by a vendor in support of the Hanford Tank Waste Remediation System (TWRS) Low-Level Waste (LLW) Vitrification Program. The vendor providing this test plan and conducting the work detailed within it [one of seven selected for glass melter testing under Purchase Order MMI-SVV-384212] is the Westinghouse Science and Technology Center (WSTC) in Pittsburgh, PA. WSTC authors of the test plan are D. F. McLaughlin, E. J. Lahoda, W. R. Gass, and N. D'Amico. The WSTC Program Manager for this test is D. F. McLaughlin. This test plan is for Phase I activities described in the above Purchase Order. Test conduct includes melting of glass frit with Hanford LLW Double-Shell Slurry Feed waste simulant in a plasma arc fired furnace.

9660 (WHC-SD-WM-WP–284) **Work plan for upgrade of SY-101 Hydrogen Mitigation Test Project Data Acquisition and Control Systemm (DACS-1).** Truitt, R.W. Westinghouse Hanford Co., Richland, WA (United States). Aug 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004971. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this effort is to upgrade the existing DACS-1 used for control and data acquisition in support of the hydrogen mitigation program for tank 101-SY. The planned upgrades will enhance the system capabilities to support additional mitigation projects and improve the system operability by implementing changes identified during operation of the system to date. Once the upgrades have been implemented, the DACS-1 system should operate as it did prior to the upgrade, but with greatly increased speed and capability. No retraining of Test Engineers will be required; the upgrade is designed to be transparent to those who operate it, with only a noticeable increase in the speed of the system. This work plan defines the tasks required for implementing the upgrade. It identifies deliverables, responsible organizations and individuals, interfaces, and schedule. This upgrade effort employs system engineering principles wherever applicable.

9661 (WHC-SD-WM-WP–287) **Work plan for SY Farm Integrated Data Acquisition and Control System (DACS-2a).** Conner, R.P.; Katz, R.S. Westinghouse Hanford Co., Richland, WA (United States). 17 Oct 1994. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002459. Source: OSTI; NTIS; INIS; GPO Dep.

The SY Farm currently has a temporary Data Acquisition & Control System (DACS) housed in a mobile trailer. The system is currently referred to as DACS-1. It was designed and configured to support engineers and scientists conducting the special performance evaluation and testing program for the safety mitigation test equipment located in waste tank 241-SY-101 (101-SY). It is currently being maintained and utilized by engineering personnel to monitor and control the 101-SY mitigation pump activities. Based upon the results of the mitigation testing program, some of the temporary test mitigation equipment (such as mixing pump) will be replaced with longer-term "operational" mitigation equipment. This is resulting in new requirements for the Data Acquisition and Control System which will be full-filled by a newer control facility referred to as the DACS-2. A teaming between Westinghouse Hanford Company (WHC) and Los Alamos National Laboratory (LANL) has been established for the SY farm mitigation program in order to develop and implement the "next generation" of the data acquisition and control system for the mitigation pump operations. The new system will be configured for use by the tank farm operational personnel. It will support the routine operations necessary for safety mitigation and the future waste retrieval of Project W-211. It is intended to replace the existing DACS-1 and provide the necessary control room space for future integration of W-211.

9662 (WHC-SD-WM-WP–295) **Engineering work plan for implementing the Process Condensate Recycle Project at the 242-A evaporator.** Haring, D.S. Westinghouse Hanford Co., Richland, WA (United States). 2 Feb 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006787. Source: OSTI; NTIS; INIS; GPO Dep.

The 242-A Evaporator facility is used to reduce the volume of waste stored in the Hanford double shell tanks. This facility uses filtered raw water for cooling, de-entrainment pad sprays, pump seal water, and chemical tank make-up. Some of these uses result in the introduction of filtered raw water into the process, thus increasing the volume of waste requiring evaporation and subsequent treatment by the 200 East Effluent Treatment Facility. The pump seal water and the de-entrainment pad spray systems were identified as candidates for a waste minimization upgrade. This work plan describes the activities associated with the design, installation, testing and initial operation of the process condensate recycle system. Implementation of the process condensate recycle system will permit the use of process condensate in place of raw water for the de-entrainment pad sprays and pump seals. This will reduce the amount of low-level liquid waste and generated during facility operation through source reduction and recycling.

9663 (WHC-SP–1139) **Westinghouse Hanford Company FY 1995 Materials Management Plan (MMP).** Higginson, M.C. Westinghouse Hanford Co., Richland, WA (United States). Oct 1994. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005635. Source: OSTI; NTIS; INIS; GPO Dep.

The safe and sound operation of facilities and storage of nuclear material are top priorities within Hanford's environmental management, site restoration mission. The projected materials estimates,

based on the Materials Management Plan (MMP) assumptions outlined below, were prepared for Department of Energy (DOE) use in long-range planning. The Hanford MMP covers the period FY 1995 through FY 2005, as directed by DOE. All DOE Richland Operations (RL) Office facilities are essentially funded by the Office of Transition and Facilities Management, Environmental Restoration and Waste Management (EM). These facilities include PUREX, the UO_3 plant, N-Reactor, T-Plant, K-Basins, FFTF, PFP and the 300 Area Fuel Fabrication facilities. Currently DP provides partial funding for the latter two facilities. Beginning in FY 1996 (in accordance with DOE-HQ MMP assumptions), EM will fund expenses related to the storage, monitoring, and safeguarding of all Special Nuclear Material (SNM) in the PFP. Ownership and costs related to movement and/or stabilization of that material will belong to EM programs (excluding NE material). It is also assumed that IAEA will take over inventory validation and surveillance of EM owned SNM at this time (FY 1996).

9664 (WHC-SP–1141) **General Counsel's office FY 1995 site support program plan WBS 6.10.5.** Moreno, S.R. Westinghouse Hanford Co., Richland, WA (United States). Sep 1994. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002231. Source: OSTI; NTIS; GPO Dep.

The General Counsel's office provides legal counsel to all levels of WHC management; administers the intellectual property program; coordinates all WHC investigative activity and supports WHC activities to ensure compliance with all applicable federal, state, and local laws, DOE directives, contractual provisions, and other requirements. In so doing, the Office of General Counsel supports the Hanford site mission of transforming the Hanford site into an environmentally attractive and economically sustainable community. This document briefs the FY95 site support plan.

9665 (WSRC-MS–94-0349) **Validation concerns for dry storage of foreign research reactor spent nuclear fuel.** Trumble, E.F. Westinghouse Savannah River Co., Aiken, SC (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-941207–7: Spent nuclear fuel meeting: challenges and initiatives, Salt Lake City, UT (United States), 14-16 Dec 1994). Order Number DE95001467. Source: OSTI; NTIS; INIS; GPO Dep.

Recent decisions by the Department of Energy have accelerated the need for storage options to support the return of foreign research reactor (FRR) fuel to the United States. Many of these returns consist of fuel types which contain highly enriched uranium and are aluminum clad. These attributes present many challenges not experienced in the fuel storage designs for commercial nuclear fuels where the fuels have lower enrichment and the cladding is more robust. Historically, returned FRR fuel has been stored for short periods in basins where it is cooled and then sent to be reprocessed. However, a severe lack of basin space and questionable availability of reprocessing facilities necessitates the development of other proposals. One proposed option is to store the FRR fuel in a dry state, thus reducing the corrosion problems associated with aluminum cladding. A drawback to this type of storage, however, is the lack of experimental data for this type of fuel under dry storage conditions. This lack of data has led to recent discussions over the accuracy of some of the current multigroup cross section libraries when applied to dry, fast systems of uranium and aluminum. This concern is evaluated for the specific case of Material Test Reactor (MTR) fuel (MTR is >60% of FRR fuel), a review of applicable experiments is presented and a new experiment is proposed.

9666 (WSRC-MS–94-0367) **Hot-wall corrosion testing of simulated high level nuclear waste.** Chandler, G.T.; Zapp, P.E.; Mickalonis, J.I. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950304–9: Corrosion '95: National Association of Corrosion Engineers (NACE) international annual conference and corrosion show, Orlando, FL (United States), 26-31 Mar 1995). Order Number DE95005007. Source: OSTI; NTIS; INIS; GPO Dep.

Three materials of construction for steam tubes used in the evaporation of high level radioactive waste were tested under heat flux conditions, referred to as hot-wall tests. The materials were type 304L stainless steel alloy C276, and alloy G3. Non-radioactive acidic and alkaline salt solutions containing halides and mercury simulated different high level waste solutions stored or processed at the United States Department of Energy's Savannah River Site. Alloy C276 was also tested for corrosion susceptibility under steady-state conditions. The nickel-based alloys C276 and G3 exhibited excellent corrosion resistance under the conditions studied. Alloy C276 was not susceptible to localized corrosion and had a corrosion rate of 0.01 mpy (0.25 μm/y) when exposed to acidic waste sludge and precipitate slurry at a hot-wall temperature of 150°C. Type 304L was susceptible to localized corrosion under the same conditions. Alloy G3 had a corrosion rate of 0.1 mpy (2.5 μm/y) when exposed to caustic high level waste evaporator solution at a hot-wall temperature of 220°C compared to 1.1 mpy (28.0 μ/y) for type 304L. Under extreme caustic conditions (45 weight percent sodium hydroxide) G3 had a corrosion rate of 0.1 mpy (2.5 μm/y) at a hot-wall temperature of 180°C while type 304L had a high corrosion rate of 69.4 mpy (1.8 mm/y).

9667 (WSRC-MS–94-0524) **Corrosion of aluminum-cald spent fuel in reactor basin water storage.** Howell, J.P. Westinghouse Savannah River Co., Aiken, SC (United States). [1994]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950304–1: Corrosion '95: National Association of Corrosion Engineers (NACE) international annual conference and corrosion show, Orlando, FL (United States), 26-31 Mar 1995). Order Number DE95001475. Source: OSTI; NTIS; INIS; GPO Dep.

Aluminum-clad fuel and target materials have been in reactor basin water storage at the Savannah River Site (SRS) for times exceeding five years. This extended storage is the result of decisions to suspend processing of nuclear materials for Defense at SRS and other Department of Energy locations. During this interim storage period, significant pitting corrosion of the aluminum clad has resulted in exposure of the uranium core leading to the release of cesium-137 and other fission products to the basin water. An aggressive Basin Management Program has been implemented at SRS in response to the corrosion issue. This intense effort to clean the basins, deionize the water, and control the cesium activity appears to be making positive progress. Basin corrosion tests underway in K-Disassembly Basin in 1994 show no corrosion of the aluminum clad after 6 months exposure to current basin conditions compared to tests in 1992 which showed corrosion penetrating the cladding in 45 days. Sim-ilar tests in P and L-Disassembly Basins show no corrosion after 8 months in basin water storage. This paper reviews the results of the corrosion test program and describes the changes implemented by the Basin Management Program leading to improvements in the interim storage of Spent Nuclear Fuel at SRS.

9668 (WSRC-MS–94-0541) **Hydrogen Evolution and Sludge Suspension During the Preparation of the First Batch of Sludge at the Savannah River Site.** Hay, M.S.; Lee, E.D. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–33: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95060090. Source: OSTI; NTIS; INIS; GPO Dep.

The first batch of High Level Radioactive Sludge for the Defense Waste Processing Facility is being prepared in two 4.9 million liter waste tanks. The preparation involves removing water soluble salts by washing (water addition, sludge suspension, settling and decantation). Sludge suspension is accomplished using long shafted slurry pumps that are mounted on rotating turntables. During the sludge suspension runs in 1993 and 1994, the slurry pumps' cleaning radius was determined to be less than that expected from previous determinations using synthetic sludge in a full size waste tank mockup. Hydrogen concentrations in the tanks' vapor space were monitored during the sludge suspension activities. As expected, the initial agitation of the sludge increased the hydrogen concentration, however, with the controls in place the hydrogen concentration was maintained below seven percent of the lower flammability limit.

9669 (WSRC-MS–94-0556) **A disposition strategy for highly enriched, aluminum-based fuel from research and test**

reactors. McKibben, J.M.; Gould, T.H.; McDonell, W.R.; Bickford, W.E. Westinghouse Savannah River Co., Aiken, SC (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-941207–14: Spent nuclear fuel meeting: challenges and initiatives, Salt Lake City, UT (United States), 14-16 Dec 1994). Order Number DE95002822. Source: OSTI; NTIS; INIS; GPO Dep.

The strategy proposed in this paper offers the Department of Energy an approach for disposing of aluminum-based, highly enriched uranium (HEU) spent fuels from foreign and domestic research reactors. The proposal is technically, socially, and economically sound. If implemented, it would advance US non-proliferation goals while also disposing of the spent fuel's waste by timely and proven methods using existing technologies and facilities at SRS without prolonged and controversial storage of the spent fuel. The fuel would be processed through 221-H. The radioactive fission products (waste) would be treated along with existing SRS high level waste by vitrifying it as borosilicate glass in the Defense Waste Processing Facility (DWPF) for disposal in the national geological repository. The HEU would be isotopically diluted, during processing, to low-enriched uranium (LEU) which can not be used to make weapons, thus eliminating proliferation concerns. The LEU can be sold to fabricators of either research reactor fuel or commercial power fuel. This proposed processing-LEU recycle approach has several important advantages over other alternatives, including: Lowest capital investment; lowest net total cost; quickest route to acceptable waste form and final geologic disposal; and likely lowest safety, health, and environmental impacts.

9670 (WSRC-MS–94-0567) **Metallography of pitted aluminum-clad, depleted uranium fuel.** Nelson, D.Z.; Howell, J.P. Westinghouse Savannah River Co., Aiken, SC (United States). [1994]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950304–6: Corrosion '95: National Association of Corrosion Engineers (NACE) international annual conference and corrosion show, Orlando, FL (United States), 26-31 Mar 1995). Order Number DE95003906. Source: OSTI; NTIS; INIS; GPO Dep.

The storage of aluminum-clad fuel and target materials in the L-Disassembly Basin at the Savannah River Site for more than 5 years has resulted in extensive pitting corrosion of these materials. In many cases the pitting corrosion of the aluminum clad has penetrated in the uranium metal core, resulting in the release of plutonium, uranium, cesium-137, and other fission product activity to the basin water. In an effort to characterize the extent of corrosion of the Mark 31A target slugs, two unirradiated slug assemblies were removed from basin storage and sent to the Savannah River Technology Center for evaluation. This paper presents the results of the metallography and photographic documentation of this evaluation. The metallography confirmed that pitting depths varied, with the deepest pit found to be about 0.12 inches (3.05 nun). Less than 2% of the aluminum cladding was found to be breached resulting in less than 5% of the uranium surface area being affected by corrosion. The overall integrity of the target slug remained intact.

9671 (WSRC-MS–94-0590) **Tests of Cs-137 removal from DWPF samples prior to analysis.** Dewberry, R.A.; Coleman, C.J. Westinghouse Savannah River Co., Aiken, SC (United States). 10 Nov 1994. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-940813–34: 208. American Chemical Society national meeting, Washington, DC (United States), 21-26 Aug 1994). Order Number DE95005006. Source: OSTI; NTIS; INIS; GPO Dep.

The Defense Waste Processing Facility (DWPF) will be used to encapsulate high-level radioactive waste into borosilicate glass at the Savannah River Site. To ensure that the process streams will be blended in the right proportions to produce durable glass, process control analyses will be performed in a laboratory in the DWPF. The high radioactivity of DWPF samples will require that sample preparation, including dissolution and dilution of samples, be performed in shielded cells. However the final analyses will be made with instruments and spectrometers contained in unshielded fume hoods. The primary radiation concern is the exposure to y-rays from the decay of Cs-137 after samples are removed from the shielded cells. Since there are several methods available for removing Cs-137 from samples, investigations were made into removing Cs-137 from DWPF samples prior to analysis in order to reduce worker exposure. Results are presented of the efficiency of various Cs-137 removal techniques and the effects of these techniques on analytical precision and accuracy.

9672 (WSRC-MS–94-0607) **Dynamic and quasi-static simulation and analysis of the plutonium oxide/metal containers subject to 30-foot dropping.** Gong, C.; Miller, R.F. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950439–3: SMS simulation multiconference: simulation as a critical technology, Phoenix, AZ (United States), 9-13 Apr 1995). Order Number DE95005010. Source: OSTI; NTIS; INIS; GPO Dep.

This analysis of the plutonium oxide/metal storage containers is in support of the design and testing project The results from the dynamic analysis show some important facts that have not been considered before. The internal bagless transfer can will have higher stress than the primary container. The quasi-static analysis provides a conservative solution. In both vertical upright drop (dynamic) and inclined upside down drop (quasi-static) the containers are structurally sound.

9673 (WSRC-MS–94-0612) **Recycle of radiologically contaminated austenitic stainless steels.** Imrich, K.J.; Leader, D.R.; Iyer, N.C.; Louthan, M.R. Jr. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95006464. Source: OSTI; NTIS; INIS; GPO Dep.

The United States Department of Energy owns large quantities of radiologically contaminated austenitic stainless steel which could by recycled for reuse if appropriate release standards were in place. Unfortunately, current policy places the formulation of a release standard for USA industry years, if not decades, away. The Westinghouse Savannah River Company, Idaho National Engineering Laboratory and various university and industrial partners are participating in initiative to recycle previously contaminated austenitic stainless steels into containers for the storage and disposal of radioactive wastes. This paper describes laboratory scale experiments which demonstrated the decontamination and remelt of stainless steel which had been contaminated with radionuclides.

9674 (WSRC-MS–94-0625) **A dynamic simulation model of the Savannah River Site high level waste complex.** Gregory, M.V. (and others); Aull, J.E.; Dimenna, R.A. Westinghouse Savannah River Co., Aiken, SC (United States). [1994]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–2: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95004804. Source: OSTI; NTIS; INIS; GPO Dep.

A detailed, dynamic simulation entire high level radioactive waste complex at the Savannah River Site has been developed using SPEEDUP(tm) software. The model represents mass transfer, evaporation, precipitation, sludge washing, effluent treatment, and vitrification unit operation processes through the solution of 7800 coupled differential and algebraic equations. Twenty-seven discrete chemical constituents are tracked through the unit operations. The simultaneous simultaneous simulation of concurrent batch and continuous processes is achieved by several novel, customized SPEEDUP(tm) algorithms. Due to the model's computational burden, a high-end work station is required: simulation of a years operation of the complex requires approximately three CPU hours on an IBM RS/6000 Model 590 processor. The model will be used to develop optimal high level waste (HLW) processing strategies over a thirty year time horizon. It will be employed to better understand the dynamic inter-relationships between different HLW unit operations, and to suggest strategies that will maximize available working tank space during the early years of operation and minimize overall waste processing cost over the long-term history of the complex. Model validation runs are currently underway with comparisons against actual plant operating data providing an excellent match.

9675 (WSRC-MS–94-0630) **Modeling of batch operations in the Defense Waste Processing Facility at the Savannah**

River Site. Smith, F.G. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950439–2: SMS simulation multiconference: simulation as a critical technology, Phoenix, AZ (United States), 9-13 Apr 1995). Order Number DE95005884. Source: OSTI; NTIS; INIS; GPO Dep.

A computer model is in development to provide a dynamic simulation of batch operations within the Defense Waste Processing Facility (DWPF) at the Savannah River Site (SRS). The DWPF will chemically treat high level waste materials from the site tank farm and vitrify the resulting slurry into a borosilicate glass for permanent disposal. The DWPF consists of three major processing areas: Salt Processing Cell (SPC), Chemical Processing Cell (CPC) and the Melt Cell. Separate models have been developed for each of these process units using the SPEEDUP™ software from Aspen Technology. Except for glass production in the Melt Cell, all of the chemical operations within DWPF are batch processes. Since the SPEEDUP software is designed for dynamic modeling of continuous processes, considerable effort was required to devise batch process algorithms. This effort was successful and the models are able to simulate batch operations and the dynamic behavior of the process. In this paper, we will describe the SPC model in some detail and present preliminary results from a few simulation studies.

9676 (WSRC-MS–94-0658) **Development of the stored waste autonomous mobile inspector (SWAMI II).** Peterson, K.D.; Ward, C.R. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–17: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95006463. Source: OSTI; NTIS; INIS; GPO Dep.

A mobile robot system called the Stored Waste Autonomous Mobile Inspector (SWAMI) is under development by the Savannah River Technology Center (SRTC) Robotics Group of Westinghouse Savannah River Company (WSRC) to perform mandated inspections of waste drums stored in warehouse facilities. The system will reduce personnel exposure to potential hazards and create accurate, high-quality documentation to ensure regulatory compliance and enhance waste management operations. Development work is coordinated among several Department of Energy (DOE), academic, and commercial entities in accordance with DOE's technology transfer initiative. The prototype system, SWAMI I, was demonstrated at Savannah River Site (SRS) in November, 1993. SWAMI II is now under development for field trials at the Fernald site.

9677 (WSRC-MS–95-0009) **Nitric-phosphoric acid oxidation of solid and liquid organic materials.** Pierce, R.A.; Smith, J.R.; Poprik, D.C. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–16: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95006462. Source: OSTI; NTIS; INIS; GPO Dep.

Nitric-phosphoric acid oxidation has been developed specifically to address issues that face the Savannah River Site, other defense-related facilities, private industry, and small-volume generators such as university and medical laboratories. Initially tested to destroy and decontaminate SRS solid, Pu-contaminated job-control waste, the technology has also exhibited potential for remediating hazardous and mixed-hazardous waste forms. The process is unique to Savannah River and offers a valuable alternative to other oxidation processes that require extreme temperatures and/or elevated pressures. To address the broad categories of waste, many different organic compounds which represent a cross-section of the waste that must be treated have been successfully oxidized. Materials that have been quantitatively oxidized at atmospheric pressure below 180°C include neoprene, cellulose, EDTA, tributylphosphate, and nitromethane. More stable compounds such as benzoic acid, polyethylene, oils, and resins have been completely decomposed below 200°C and 10 psig. The process uses dilute nitric acid in a concentrated phosphoric acid media as the main oxidant for the organic compounds. Phosphoric acid allow nitric acid to be retained in solution well above its normal boiling point. The reaction forms NOx vapors which can be reoxidized and recycled using air and water. The addition of 0.001M Pd(II) reduces CO generation to near 1% of the released carbon gases. The advantages of this process are that it is straightforward, uses relatively inexpensive reagents, operates at relatively low temperature and pressure, and produces final solutions which are compatible with stainless steel equipment. For organic wastes, all carbon, hydrogen, and nitrogen are converted to gaseous products. If interfaced with an acid recovery system which converts NOx back to nitric acid, the net oxidizer would be oxygen from air.

9678 (WSRC-MS–95-0010) **Determination of uranium distribution in the evaporation of simulated Savannah River Site waste.** Barnes, M.J.; Chandler, G.T. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–13: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95005482. Source: OSTI; NTIS; INIS; GPO Dep.

The results of an experimental program addressing the distribution of uranium in saltcake and supernate for two Savannah River Site waste compositions are presented. Successive batch evaporations were performed on simulated H-Area Modified Purex low-heat and post-aluminum dissolution wastes spiked with depleted uranium. Waste compositions and physical data were obtained for supernate and saltcake samples. For the H-Area Modified Purex low-heat waste, the product saltcake contained 42% of the total uranium from the original evaporator feed solution. However, precipitated solids only accounted for 10% of the original uranium mass; the interstitial liquid within the saltcake matrix contained the remainder of the uranium. In the case of the simulated post-aluminum dissolution waste; the product saltcake contained 68% of the total uranium from the original evaporator feed solution. Precipitated solids accounted for 52% of the original uranium mass; again, the interstitial liquid within the saltcake matrix contained the remainder of the uranium. An understanding of the distribution of uranium between supernatant liquid, saltcake, and sludge is required to develop a material balance for waste processing operations. This information is necessary to address nuclear criticality safety concerns.

9679 (WSRC-MS–95-0050) **Successful characterization of radioactive waste at the Savannah River Site.** Hughes, M.B. (Westinghouse Savannah River Co., Aiken, SC (United States)); Miles, G.M. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–14: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95006472. Source: OSTI; NTIS; INIS; GPO Dep.

Characterization of the low-level radioactive waste generated by forty five independent operating facilities at The Savannah River Site (SRS) experienced a slow start. However, the site effectively accelerated waste characterization based on findings of an independent assessment that recommended several changes to the existing process. The new approach included the development of a generic waste characterization protocol and methodology and the formulation of a technical board to approve waste characterization. As a result, consistent, detailed characterization of waste streams from SRS facilities was achieved in six months.

9680 (WSRC-MS–95-0057) **Applications of Atomistic Simulation to Radioactive and Hazardous Waste Glass Formulation Development.** Kielpinski, A.L. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–34: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95060092. Source: OSTI; NTIS; INIS; GPO Dep.

Glass formulation development depends on an understanding of the effects of glass composition on its processibility and product quality. Such compositional effects on properties in turn depend on the microscopic structure of the glass. Historically, compositional effects on macroscopic properties have been explored empirically, e.g., by measuring viscosity at various glass compositions. The

relationship of composition to structure has been studied by microstructural experimental methods. More recently, computer simulation has proved a fruitful complement to these more traditional methods of study. By simulating atomic interaction over a period of time using the molecular dynamics method, a direct picture of the glass structure and dynamics is obtained which can verify existing concepts as well as permit "measurement" of quantities inaccessible to experiment. Atomistic simulation can be of particular benefit in the development of waste glasses. As vitrification is being considered for an increasing variety of waste streams, process and product models are needed to formulate compositions for an extremely wide variety of elemental species and composition ranges. The demand for process and product models which can predict over such a diverse composition space requires mechanistic understanding of glass behavior; atomistic simulation is ideally suited for providing this understanding. Moreover, while simulation cannot completely eliminate the need for treatability studies, it can play a role in minimizing the experimentation on (and therefore contact handling of) such materials. This paper briefly reviews the molecular dynamics method, which is the primary atomistic simulation tool for studying glass structure. We then summarize the current state of glass simulation, emphasizing areas of importance for waste glass process/product modeling. At SRS, glass process and product models have been formulated in terms of glass structural concepts.

9681 (WSRC-RP–93-0878-Rev.1-Vol.2) **Economic evaluation of closure cap barrier materials study.** Serrato, M.G.; Bhutani, J.S.; Mead, S.M. USDOE Bartlesville Project Office, OK (United States). Sep 1993. 742p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95006355. Source: OSTI; NTIS; INIS; GPO Dep.

Volume II of the Economic Evaluation of the Closure Cap Barrier Materials, Revision I contains detailed cost estimates for closure cap barrier materials. The cost estimates incorporate the life cycle costs for a generic hazardous waste seepage basin closure cap under the RCRA Post Closure Period of thirty years. The economic evaluation assessed six barrier material categories. Each of these categories consists of several composite cover system configurations, which were used to develop individual cost estimates. The information contained in this report is not intended to be used as a cost estimating manual. This information provides the decision makers with the ability to screen barrier materials, cover system configurations, and identify cost-effective materials for further consideration.

9682 (WSRC-RP–94-396) **Nuclear criticality safety analysis summary report: The S-area defense waste processing facility.** Ha, B.C. Westinghouse Savannah River Co., Aiken, SC (United States). 21 Oct 1994. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95005484. Source: OSTI; NTIS; INIS; GPO Dep.

The S-Area Defense Waste Processing Facility (DWPF) can process all of the high level radioactive wastes currently stored at the Savannah River Site with negligible risk of nuclear criticality. The characteristics which make the DWPF critically safe are: (1) abundance of neutron absorbers in the waste feeds; (2) and low concentration of fissionable material. This report documents the criticality safety arguments for the S-Area DWPF process as required by DOE orders to characterize and to justify the low potential for criticality. It documents that the nature of the waste feeds and the nature of the DWPF process chemistry preclude criticality.

9683 (WSRC-RP–94-532) **Thirty-year solid waste generation forecast for facilities at SRS.** Westinghouse Savannah River Co., Aiken, SC (United States). Jul 1994. 93p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95006474. Source: OSTI; NTIS; INIS; GPO Dep.

The information supplied by this 30-year solid waste forecast has been compiled as a source document to the Waste Management Environmental Impact Statement (WMEIS). The WMEIS will help to select a sitewide strategic approach to managing present and future Savannah River Site (SRS) waste generated from ongoing operations, environmental restoration (ER) activities, transition from nuclear production to other missions, and decontamination and decommissioning (D&D) programs. The EIS will support project-level decisions on the operation of specific treatment, storage, and disposal facilities within the near term (10 years or less). In addition, the EIS will provide a baseline for analysis of future waste management activities and a basis for the evaluation of the specific waste management alternatives. This 30-year solid waste forecast will be used as the initial basis for the EIS decision-making process. The Site generates and manages many types and categories of waste. With a few exceptions, waste types are divided into two broad groups-high-level waste and solid waste. High-level waste consists primarily of liquid radioactive waste, which is addressed in a separate forecast and is not discussed further in this document. The waste types discussed in this solid waste forecast are sanitary waste, hazardous waste, low-level mixed waste, low-level radioactive waste, and transuranic waste. As activities at SRS change from primarily production to primarily decontamination and decommissioning and environmental restoration, the volume of each waste s being managed will change significantly. This report acknowledges the changes in Site Missions when developing the 30-year solid waste forecast.

9684 (WSRC-RP–95-0040) **Initial results from the canistered waste forms produced during the first campaign of the DWPF Startup Test Program.** Harbour, J.R. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–12: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95005480. Source: OSTI; NTIS; INIS; GPO Dep.

As part of the Defense Waste Processing Facility (DWPF) Startup Test Program, approximately 90 canisters will be filled with glass containing simulated radioactive waste during five separate campaigns. The first campaign is a facility acceptance test to demonstrate the operability of the facility and to collect initial data on the glass and the canistered waste forms. During the next four campaigns (the waste qualification campaigns) data will be obtained which will be used to demonstrate that the DWPF product meets DOE's Waste Acceptance Product Specifications (WAPS). Currently 12 of the 16 canisters have been filled with glass during the first campaign (FA-13). This paper describes the tests that have been carried out on these 12 glass-filled canisters and presents the data with reference to the acceptance criteria of the WAPS. These tests include measurement of canister dimensions prior to and after glass filling. dew point, composition, and pressure of the gas within the free volume of the canister, fill height, free volume, weight, leak rates of welds and temporary seals, and weld parameters.

9685 (WSRC-RP–993-0878-Rev.1-Vol.1) **Economic evaluation of closure CAP barrier materials Volume I and Volume II.** Serrato, M.G.; Bhutani, J.S.; Mead, S.M. Westinghouse Savannah River Co., Aiken, SC (United States). Sep 1993. 112p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95006354. Source: OSTI; NTIS; INIS; GPO Dep.

This study prepared by the Site Geotechnical Services (SGS) and Environmental Restoration (ER) departments of the WSRC evaluates a generic closure cover system for a hazardous waste site, using 10 different surface areas, ranging from 0.1 acre to 80 acres, and 12 barrier materials. This study presents a revision to the previous study (Rev. 0) published in June 1993, under the same title. The objective of this study was to revise the previous study by incorporating four additional site sizes into the evaluation process and identifying the most cost-effective barrier material for a given closure cover system at the SRS.

9686 (WSRC-TR–93-207-Rev.1) **Safety Evaluation of the ESP Sludge Washing Baselines Runs. Revision 1.** Gupta, M.K. Westinghouse Savannah River Co., Aiken, SC (United States). Aug 1994. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060097. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose is to provide the technical basis for the evaluation of Unreviewed Safety Question for the Extended Sludge Processing (ESP) Sludge Washing Baseline Runs. The Baseline runs are necessary: to ascertain the mechanical fitness of the equipment

and modifications not operated since 1988 and to resolve technical questions associated with process control; i.e., sludge suspension, sludge settling, heat transfer, and temperature control. These issues need to be resolved prior to resumption of normal ESP operations. The equipment used for the Baseline runs are Tanks 42H and 51H and their associated equipment.

9687 (WSRC-TR–94-0486) **Mixed Waste Management Facility groundwater monitoring report: Third quarter 1994.** Westinghouse Savannah River Co., Aiken, SC (United States). Dec 1994. 540p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95005972. Source: OSTI; NTIS; INIS; GPO Dep.

Currently, 125 wells monitor groundwater quality in the uppermost aquifer beneath the Mixed Waste Management Facility (MWMF) at the Savannah River Site. Samples from the wells are analyzed for selected heavy metals, herbicides/pesticides, indicator parameters, radionuclides, volatile organic compounds, and other constituents. As in previous quarters, tritium and trichloroethylene were the most widespread elevated constituents during third quarter 1994. Sixty-four (51%) of the 125 monitoring wells contained elevated tritium activities. Trichloroethylene concentrations exceeded the final PDWS in 22 (18%) wells. Chloroethene, 1,1-dichloroethylene, and tetrachloroethylene, elevated in one or more wells during third quarter 1994, also occurred in elevated levels during second quarter 1994. These constituents generally were elevated in the same wells during both quarters. Gross alpha, which was elevated in only one well during second quarter 1994, was elevated again during third quarter. Mercury, which was elevated during first quarter 1994, was elevated again in one well. Dichloromethane was elevated in two wells for the first time in several quarters.

9688 (WSRC-TR–94-0596) **Titanium for long-term tritium storage.** Heung, L.K. Westinghouse Savannah River Co., Aiken, SC (United States). Dec 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95006465. Source: OSTI; NTIS; INIS; GPO Dep.

Due to the reduction of nuclear weapon stockpile, there will be an excess of tritium returned from the field. The excess tritium needs to be stored for future use, which might be several years away. A safe and cost effective means for long term storage of tritium is needed. Storing tritium in a solid metal tritide is preferred to storing tritium as a gas, because a metal tritide can store tritium in a compact form and the stored tritium will not be released until heat is applied to increase its temperature to several hundred degrees centigrade. Storing tritium as a tritide is safer and more cost effective than as a gas. Several candidate metal hydride materials have been evaluated for long term tritium storage. They include uranium, La-Ni-Al alloys, zirconium and titanium. The criteria used include material cost, radioactivity, stability to air, storage capacity, storage pressure, loading and unloading conditions, and helium retention. Titanium has the best combination of properties and is recommended for long term tritium storage.

9689 (WSRC-TR–94-0620) **Subcontracting strategy for the decontamination and decommissioning of Savannah River Site's First Tritium Extraction Facility, 232-F.** Smith, C.W. Jr. (Westinghouse Savannah River Co., Aiken, SC (United States)); Dowd, A.S. Jr.; Hinds, S.S.; Johnson, S.V. Westinghouse Savannah River Co., Aiken, SC (United States). 30 Dec 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–15: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95006467. Source: OSTI; NTIS; INIS; GPO Dep.

The Savannah River Site (SRS) has been actively proceeding with the decontamination and decommissioning (D&D) of various facilities and structures which were instrumental in the success of past missions at the site. The most ambitious of these efforts involves the subcontracting of the complete D&D of the first SRS Tritium Extraction Facility, identified as building 232-F. This facility operated in the mid 1950's and discontinued operations permanently in 1958. The approach utilized for this effort attempts to invoke the novel principle of "As Commercial As Reasonably Achievable" or "ACARA". This concept of ACARA applies only the minimum essential requirements necessary to successfully perform the D&D task. Integral to this approach is the subcontractor provision for maximum flexibility in the identification of and adherence to the requirements of applicable DOE Orders, federal, state and local laws and regulations, as well as site specific procedures without violating the site contractual requirements. The technical specification prepared for this effort provides the basis for a competitively bid contract to perform the entire D&D evolution, including initial facility characterization, waste stream characterization and certification, D&D and waste disposal. Preparation and development of this specification and the subsequent Request For Proposal (RFP) was a successful team oriented endeavor. The schedule for this fast-track undertaking took three months to complete. Successful initiation of this task will be the first D&D of a facility containing both radioactive and hazardous material at an operating site within the DOE Weapons Complex. The strategy for preparing the D&D subcontract for the 232-F structure was facilitated by applying the ACARA principle. This approach resulted in the accelerated development of the specification and RFP documents, as well as minimized the complexities of proposal evaluations.

9690 (YJT–94-13) **Effects of glacial meltwater on corrosion of copper canisters.** Ahonen, L. (Geological Survey of Finland, Espoo (Finland)); Vieno, T. Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Aug 1994. 27p. Order Number DE95621966. Source: OSTI; NTIS; INIS.

The composition of glacial meltwater and its reactions in the bedrock are examined. The evidences that there are or should be from past intrusions of glacial meltwater and oxygen deep in the bedrock are also considered. The study is concluded with an evaluation of the potential effects of oxygenated meltwater on the corrosion of copper canisters. (46 refs., 3 figs., 2 tabs.).

9691 (ANL–94/38) **Analytical electron microscopy characterization of uranium-contaminated soils from the Fernald Site, FY1993 report.** Buck, E.C.; Cunnane, J.C.; Brown, N.R.; Dietz, N.L. Argonne National Lab., IL (United States). Oct 1994. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95006155. Source: OSTI; NTIS; INIS; GPO Dep.

A combination of optical microscopy, scanning electron microscopy with backscattered electron detection (SEM/BSE), and analytical electron microscopy (AEM) is being used to determine the nature of uranium in soils from the Fernald Environmental Management Project. The information gained from these studies is being used to develop and test remediation technologies. Investigations using SEM have shown that uranium is contained within particles that are typically 1 to 100 μm in diameter. Further analysis with AEM has shown that these uranium-rich regions are made up of discrete uranium-bearing phases. The distribution of these uranium phases was found to be inhomogeneous at the microscopic level.

9692 (BNL–52432) **Brookhaven National Laboratory site environmental report for calendar year 1993.** Naidu, J.R.; Royce, B.A. (eds.). Brookhaven National Lab., Upton, NY (United States). May 1994. 258p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95007527. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the results of the Environmental Monitoring Program at BNL and presents summary information about environmental compliance for 1993. To evaluate the effect of BNL operations on the local environment, measurements of direct radiation, and a variety of radionuclides and chemical compounds in ambient air, soil, sewage effluent, surface water, ground water and vegetation were made at the BNL site and at sites adjacent to the Laboratory. Brookhaven National Laboratory's compliance with all applicable guides, standards, and limits for radiological and nonradiological emissions to the environment were evaluated. Among

the permitted facilities, two instances, of pH exceedances were observed at recharge basins, possible related to rain-water run-off to these recharge basins. Also, the discharge from the Sewage Treatment Plant (STP) to the Peconic River exceeded on five occasions, three for residual chlorine and one each for iron and ammonia nitrogen. The chlorine exceedances were related to a malfunctioning hypochlorite dosing pump and ceased when the pump was repaired. While the iron and ammonia-nitrogen could be the result of disturbances to the sand filter beds during maintenance. The environmental monitoring data has identified site-specific contamination of ground water and soil. These areas are subject to Remedial Investigation/Feasibility Studies (RI/FS) under the Inter Agency Agreement (IAG). Except for the above, the environmental monitoring data has continued to demonstrate that compliance was achieved with applicable environmental laws and regulations governing emission and discharge of materials to the environment, and that the environmental impacts at BNL are minimal and pose no threat to the public or to the environment. This report meets the requirements of DOE Orders 5484. 1, Environmental Protection, Safety, and Health Protection Information reporting requirements and 5400.1, General Environmental Protection Programs.

9693 (DOE-HDBK–3010-94-Vol.1) **Airborne release fractions/rates and respirable fractions for nonreactor nuclear facilities. Volume 1, Analysis of experimental data.** USDOE, Washington, DC (United States). Dec 1994. 361p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95004712. Source: OSTI; NTIS; INIS; GPO Dep.

This handbook contains (1) a systematic compilation of airborne release and respirable fraction experimental data for nonreactor nuclear facilities, (2) assessments of the data, and (3) values derived from assessing the data that may be used in safety analyses when the data are applicable. To assist in consistent and effective use of this information, the handbook provides: identification of a consequence determination methodology in which the information can be used; discussion of the applicability of the information and its general technical limits; identification of specific accident phenomena of interest for which the information is applicable; and examples of use of the consequence determination methodology and airborne release and respirable fraction information.

9694 (DOE-HDBK–3010-94-Vol.2) **Airborne release fractions/rates and respirable fractions for nonreactor nuclear facilities. Volume 2, Appendices.** USDOE, Washington, DC (United States). Dec 1994. 253p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95004711. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains compiled data from the DOE Handbook on Airborne Release Fractions/Rates and Respirable Fractions for Nonreactor Nuclear facilities. Source data and example facilities utilized, such as the Plutonium Recovery Facility, are included.

9695 (DOE/NV/10872–T158) **A floristic survey of Yucca Mountain and vicinity, Nye County, Nevada.** Niles, W.E.; Leary, P.J.; Holland, J.S.; Landau, F.H. Nevada Univ., Las Vegas, NV (United States). Dec 1994. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC08-90NV10872. Order Number DE95007343. Source: OSTI; NTIS; INIS; GPO Dep.

A survey of the vascular flora of Yucca Mountain and vicinity, Nye County, Nevada, was conducted from March to June 1994. An annotated checklist of recorded taxa was compiled. Voucher plant specimens were collected and accessioned into the Herbarium at the University of Nevada, Las Vegas. Collection data accompanying these specimens were entered into that herbarium's electronic data base. Combined results from this survey and the works of other investigators reveal the presence of a total of 325 specific and intraspecific taxa within the area, these allocated to 162 genera and 53 families. Owing to drought conditions prevalent throughout the area, the annual floristic component was largely absent during the period of study, and it is likely much underrepresented in the tabulation of results. No taxon currently listed as threatened or endangered under the Endangered Species Act was encountered during this study. Several candidate species for listing under this Act were present, and distributional data for these were recorded. No change in the status of these candidate species is recommended as the result of this survey.

9696 (DOE/RL–94-36-3) **Quarterly report of RCRA groundwater monitoring data for period July 1 through September 30, 1994.** Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 405p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006800. Source: OSTI; NTIS; GPO Dep.

Hanford Site interim-status groundwater monitoring projects are conducted as either background, indicator parameter evaluation, or groundwater quality assessment monitoring programs as defined in the Resource Conservation and Recovery Act of 1976 (RCRA); and "Interim Status Standards for Owners and Operators of Hazardous Waste Treatment, Storage, and Disposal Facilities", as amended. Compliance with the 40 CFR 265 regulations is required by the Washington Administrative Code (WAC) 173-303. This report contains data from Hanford Site groundwater monitoring projects. Westinghouse Hanford Company (WHC) manages RCRA groundwater monitoring projects for federal facilities on the Hanford Site. Project management, specifying data needs, performing quality control (QC) oversight, managing data, and preparing project sampling schedules are all parts of this responsibility. Pacific Northwest Laboratory (PNL) administers the contract for analytical services and provides groundwater sampling services to WHC for the RCRA groundwater monitoring program. This quarterly report contains data received between August 20 and November 18, 1994, which are the cutoff dates for this reporting period. This report may contain not only data from the July through September quarter but also data from earlier sampling events that were not previously reported. The quarterly report is a means of reporting groundwater data that were collected from the previous quarter. No interpretation on the data is done during the quarterly reporting process. Interpretation of all data is presented in the Annual Report for RCRA Groundwater Monitoring Projects at the Hanford Site for that reporting year.

9697 (DOE/RW/00134–T16) **Yucca Mountain Site Characterization Project technical data catalog: Quarterly supplement.** TRW, Inc., Fairfax, VA (United States). 31 Dec 1994. 151p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-91RW00134. Order Number DE95007580. Source: OSTI; NTIS; GPO Dep.

The Department of Energy (DOE)/Nuclear Regulatory Commission (NRC) Site-Specific Procedural Agreement for Geologic Repository Site Investigation and Characterization Program requires the DOE to develop and maintain a catalog of data which will be updated and provided to the NRC at least quarterly. This catalog is to include a description of the data; the time (date), place, and method of acquisition; and where the data may be examined. The Yucca Mountain Site Characterization Project (YMP) Technical Data Catalog is published and distributed-in accordance with the requirements of the Site-Specific Agreement. The YMP Technical Data Catalog is a report based on reference information contained in the YMP Automated Technical Data Tracking System (ATDT). The reference information is provided by Participants for data acquired or developed in support of the YMP. The Technical Data Catalog is updated quarterly and distributed in the month following the end of each quarter. A complete revision to the catalog is published at the end of each fiscal year. Supplements to the end-of-year edition are published each quarter. These supplements provide information related to new data items not included in previous quarterly updates and data items affected by changes to previously published reference information. The Technical Data Catalog, dated September 30, 1994, should be retained as the baseline document for the supplements until the end-of-year revision is published and distributed in October 1995.

9698 (EGG-M–94173) **Pollution prevention opportunity assessment: Foundation of pollution prevention for waste management.** Damewood, R.W. Idaho National Engineering Lab., Idaho Falls, ID (United States). 24 Mar 1994. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9408204–1: 2. annual international conference on global business environment and strategies, Sun Valley, ID (United States), 11-13 Aug 1994). Order Number DE95005033. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper is to promote the Pollution Prevention Opportunity Assessment (PPOA) technique as a fundamental of

pollution prevention for waste management. All key elements of an effective PPOA program are presented. These key elements include impacts of environmental laws on pollution prevention, PPOA concepts and overview, waste minimization opportunities assessment, reporting and monitoring waste minimization progress, and PPOA program implementation. As environmental laws evolve the focus is shifting from end-of-pipe pollution control to front-end source reduction. Waste minimization was mistakenly interpreted to mean the reduction of hazardous waste after generation in the past. The Pollution Prevention Act of 1990 has clearly defined its requirement on resource reduction. Waste reduction can be viewed as a criterion to assess all industrial processes and operations. The fundamental approach of PPOA focuses on a mass balance concept. This concept deals with tracking of chemicals from the point of purchase, through storage, utilization in the process, and waste generation at the end of process. In other words, PPOA is a technique to analyze this input/output process. By applying PPOA techniques, the framework of applicable compliance requirements to the current operation process is established. Furthermore, documentation of PPOA itself can meet as documentation requirements for environmental compliance. In general, the PPOA process consists of two phases. The first phase involves input and output process description and waste characterization. The second phase is an opportunities assessment for waste minimization from input/output waste characterization. These two phases are explained in detail in the paper.

9699 (ES/ESH–47) **Oak Ridge Reservation, annual site environmental report for 1993.** Oak Ridge National Lab., TN (United States). Nov 1994. 330p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95006675. Source: OSTI; NTIS; INIS; GPO Dep.

The US DOE currently oversees activities on the Oak Ridge Reservation, a government-owned, contractor-operated facility. Three sites compose the reservation; Y-12, Oak Ridge National Laboratory, and K-25. This document contains a summary of environmental monitoring activities on the Oak Ridge Reservation (ORR) and its surroundings. The results summarized in this report are based on the data collected during calendar year (CY) 1993 and compiled in; Environmental Monitoring in the Oak Ridge Reservation: CY 1993 Results. Annual environmental monitoring on the ORR consists of two major activities: effluent monitoring and environmental surveillance. Effluent monitoring is the collection and analysis of samples or measurements of liquid, gaseous, or airborne effluents for the purpose of characterizing and quantifying contaminants and process stream characteristics, assessing radiation and chemical exposures to members of the public, and demonstrating compliance with applicable standards. Environmental surveillance is the collection and analysis of samples of air, water, soil, foodstuffs, biota, and other media from DOE sites and their environs and the measurement of external radiation for purposes of demonstrating compliance with applicable standards, assessing radiation and chemical exposures to members of the public, and assessing effects, if any, on the local environment.

9700 (ES/ESH–49) **Oak Ridge reservation, annual site environmental report summary for 1993.** Oak Ridge National Lab., TN (United States). Nov 1994. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95006674. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy requires annual site environmental reports from facilities that operate under its auspices. To fulfill that requirement, such an annual report is published for the Oak Ridge Reservation, which comprises three major sites, each of which has unique monitoring requirements in addition to many shared obligations. As a result, the report is complex and highly detailed. Annual site environmental reports are public documents that are read by government regulators, scientists, engineers, business people, special interest groups, and members of the public at large. For that reason, the reports need to be accessible to a variety of audiences in addition to being accurate and complete. This pamphlet summarizes environmental activities on the reservation, which for some readers may be adequate; for those who seek more detail, it will lend coherence to their approach to the report itself. The content of this summary was taken from Oak Ridge Reservation Annual Site Environmental Report for 1993. Results of the many environmental monitoring and surveillance activities are detailed in this report.

9701 (ES/ESH–51) **Portsmouth Gaseous Diffusion Plant Annual Site Environmental Report summary for 1993.** Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States); Portsmouth Gaseous Diffusion Plant, OH (United States). Nov 1994. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (POEF–3051). Order Number DE95006672. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains summaries of the environmental programs at Paducah Gaseous Diffusion Plant, environmental monitoring and the results, and the impact of operations on the environment and the public for 1993. The environmental monitoring program at Paducah includes effluent monitoring and environmental surveillance. Effluent monitoring is measurement of releases as they occur. Contaminants are released through either airborne emissions or liquids discharged from the plant. These releases occur as part of normal site operations, such as cooling water discharged from the uranium enrichment cascade operations or airborne releases from ventilation systems. In the event of system failure, this monitoring provides timely warning so that corrective action can be taken before releases reach an unsafe level. Environmental surveillance tracks the dispersion of materials into the environment after they have been released. This involves the collection of samples from various media, such as water, soil, vegetation, and food crops, and the analysis of these samples for certain radionuclides, chemicals, and metals.

9702 (ES/ESH–53) **Paducah Gaseous Diffusion Plant Annual Site Environmental Report for 1993.** Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States); Martin Marietta Energy Systems, Paducah, KY (United States). Oct 1994. 160p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ; AC05-76OR00001. (KY/ERWM–18). Order Number DE95006635. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to summarize effluent monitoring and environmental surveillance results and compliance with environmental laws, regulations, and orders at the Paducah Gaseous Diffusion Plant (PGDP). Environmental monitoring at PGDP consists of two major activities: effluent monitoring and environmental surveillance. Effluent monitoring is direct measurement or the collection and analysis of samples of liquid and gaseous discharges to the environment. Environmental surveillance is direct measurement or the collection and analysis of samples of air, water, soil, foodstuff, biota, and other media. Environmental monitoring is performed to characterize and quantify contaminants, assess radiation exposures of members of the public, demonstrate compliance with applicable standards and permit requirements, and detect and assess the effects (if any) on the local environment. Multiple samples are collected throughout the year and are analyzed for radioactivity, chemical content, and various physical attributes.

9703 (ES/ESH–54) **Paducah Gaseous Diffusion Plant Annual Site Environmental Report summary for 1993.** Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States); Martin Marietta Energy Systems, Paducah, KY (United States). Nov 1994. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ; AC05-76OR00001. (KY/ERWM–19). Order Number DE95006671. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains summaries of the environmental programs at Paducah Gaseous Diffusion Plant, environmental monitoring and the results, and the impact of operations on the environment and the public for 1993. The environmental monitoring program at Paducah includes effluent monitoring and environmental surveillance. Effluent monitoring is measurement of releases as they occur. Contaminants are released through either airborne emissions or liquids discharged from the plant. These releases occur as part of normal site operations, such as cooling water discharged from the uranium enrichment cascade operations or airborne releases from ventilation systems. In the event of system failure, this monitoring provides timely warning so that corrective action can be taken before releases reach an unsafe level. Environmental surveillance tracks the dispersion of materials into the environment after they

have been released. This involves the collection of samples from various media, such as water, soil, vegetation, and food crops, and the analysis of these samples for certain radionuclides, chemicals, and metals.

9704 (LA–12883-MS) **Geologic and hydrologic records of observation wells, test holes, test wells, supply wells, springs, and surface water stations in the Los Alamos area.** Purtymun, W.D. Los Alamos National Lab., NM (United States). Jan 1995. 339p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95007637. Source: OSTI; NTIS; INIS; GPO Dep.

Hundreds of holes have been drilled into the Pajarito Plateau and surrounding test areas of the Los Alamos National Laboratory since the end of World War II. They range in depth from a few feet to more than 14,000 ft. The holes were drilled to provide geologic, hydrologic, and engineering information related to development of a water supply, to provide data on the likelihood or presence of subsurface contamination from hazardous and nuclear materials, and for engineering design for construction. The data contained in this report provide a basis for further investigations into the consequences of our past, present, and future interactions with the environment.

9705 (PNL–10285) **Estimated recharge rates at the Hanford Site.** Fayer, M.J.; Walters, T.B. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95008084. Source: OSTI; NTIS; INIS; GPO Dep.

The Ground-Water Surveillance Project monitors the distribution of contaminants in ground water at the Hanford Site for the U.S. Department of Energy. A subtask called "Water Budget at Hanford" was initiated in FY 1994. The objective of this subtask was to produce a defensible map of estimated recharge rates across the Hanford Site. Methods that have been used to estimate recharge rates at the Hanford Site include measurements (of drainage, water contents, and tracers) and computer modeling. For the simulations of 12 soil-vegetation combinations, the annual rates varied from 0.05 mm/yr for the Ephrata sandy loam with bunchgrass to 85.2 mm/yr for the same soil without vegetation. Water content data from the Grass Site in the 300 Area indicated that annual rates varied from 3.0 to 143.5 mm/yr during an 8-year period. The annual volume of estimated recharge was calculated to be 8.47×10^9 L for the potential future Hanford Site (i.e., the portion of the current Site bounded by Highway 240 and the Columbia River). This total volume is similar to earlier estimates of natural recharge and is 2 to 10x higher than estimates of runoff and ground-water flow from higher elevations. Not only is the volume of natural recharge significant in comparison to other ground-water inputs, the distribution of estimated recharge is highly skewed to the disturbed sandy soils (i.e., the 200 Areas, where most contaminants originate). The lack of good estimates of the means and variances of the supporting data (i.e., the soil map, the vegetation/land use map, the model parameters) translates into large uncertainties in the recharge estimates. When combined, the significant quantity of estimated recharge, its high sensitivity to disturbance, and the unquantified uncertainty of the data and model parameters suggest that the defensibility of the recharge estimates should be improved.

9706 (PNL-SA–24355) **Declustering and stochastic simulation of ground-water tritium concentrations at Hanford, Washington.** Rossi, R.E.; Dresel, P.E. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950159–1: Workshop and symposium on geostatistics for geotechnical and environmental applications, Phoenix, AZ (United States), 26-27 Jan 1995). Order Number DE95007161. Source: OSTI; NTIS; INIS; GPO Dep.

Monitoring and characterization of radionuclides and hazardous chemicals in ground water are ongoing activities at the U.S. Department of Energy's (DOE) Hanford Site in south-central Washington State. These activities are conducted to assess the impacts of Site operations on public health and the environment, to comply with the Resource Conservation and Recovery Act (RCRA), and for characterization of sites under the Comprehensive Environmental Resource Compensation and Liability Act (CERCLA). Periodic measurement and sampling of approximately 720 wells provides site-specific information about hydraulic head and contaminant concentrations. These data are then used to infer ground-water flow directions and gradients for the interpretation of contaminant transport. Tritium, a by-product of nuclear materials production, is the most wide-spread radionuclide contaminant on site. Identification of tritium concentrations above the Drinking Water Standard (DWS) of 20,000 pCi/L are of particular concern. However, due to preferential location of monitoring wells near historical production sites, a, disproportionately large number of samples originate in higher concentration areas. Consequently, univariate as well as bivariate (spatial) statistics like the variogram need to be adjusted to account for the preferential sampling. Such "declustering" of the samples is necessary to appraise the actual proportions above or below any cutoff (e.g., the DWS) and to accurately map or simulate tritium at unsampled locations.

9707 (SAND–94-1293) **1993 Site environmental report Sandia National Laboratories, Albuquerque, New Mexico.** Culp, T.A. (and others); Cheng, C.F.; Cox, W.; Durand, N.; Irwin, M.; Jones, A.; Lauffer, F.; Lincoln, M.; McClellan, Y.; Molley, K. Sandia National Labs., Albuquerque, NM (United States). Nov 1994. 396p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95007891. Source: OSTI; NTIS; INIS; GPO Dep.

This 1993 report contains monitoring data from routine radiological and nonradiological environmental surveillance activities. Summaries of significant environmental compliance programs in progress, such as National Environmental Policy Act documentation, environmental permits, environmental restoration, and various waste management programs for Sandia National Laboratories in Albuquerque, New Mexico, are included. The maximum offsite dose impact was calculated to be 0.0016 millirem. The total population within a 50-mile (80 kilometer) radius of Sandia National Laboratories/New Mexico received an estimated collective dose of 0.027 person-rem during 1993 from the laboratories operations, As in the previous year, the 1993 operations at Sandia National Laboratories/New Mexico had no discernible impact on the general public or on the environment. This report is prepared for the U.S. Department of Energy in compliance with DOE Order 5400.1.

9708 (SREL–27) **Patterns of fish assemblage structure and dynamics in waters of the Savannah River Plant. Comprehensive Cooling Water Study final report.** Aho, J.M.; Anderson, C.S.; Floyd, K.B.; Negus, M.T.; Meador, M.R. Savannah River Ecology Lab., Aiken, SC (United States). Stress and Wildlife Ecology Div. Jun 1986. 233p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00819. Order Number DE95006762. Source: OSTI; NTIS; GPO Dep.

Research conducted as part of the Comprehensive Cooling Water Study (CCWS) has elucidated many factors that are important to fish population and community dynamics in a variety of habitats on the Savannah River Plant (SRP). Information gained from these studies is useful in predicting fish responses to SRP operations. The overall objective of the CCWS was (1) to determine the environmental effects of SRP cooling water withdrawals and discharges and (2) to determine the significance of the cooling water impacts on the environment. The purpose of this study was to: (1) examine the effects of thermal plumes on anadromous and resident fishes, including overwintering effects, in the SRP swamp and associated tributary streams; (2) assess fish spawning and locate nursery grounds on the SRP; (3) examine the level of use of the SRP by spawning fish from the Savannah River, this objective was shared with the Savannah River Laboratory, E.I. du Pont de Nemours and Company; and (4) determine impacts of cooling-water discharges on fish population and community attributes. Five studies were designed to address the above topics. The specific objectives and a summary of the findings of each study are presented.

9709 (WHC-EP–0394-9) **Groundwater maps of the Hanford Site, June 1994.** Serkowski, J.A.; Jordan, W.A.; Hartman, M.J. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006798. Source: OSTI; NTIS; INIS; GPO Dep.

This report is a continuation of reports (Kasza et al., 1994) that document the configuration of the uppermost unconfined aquifer beneath the Hanford Site. This series presents the results of the semiannual water level measurement program and the water table maps generated from these measurements. The reports document the changes in the groundwater level at the Hanford Site during the transition from nuclear material production to environmental restoration and remediation. In addition, these reports provide water level data to support the various site characterization and ground water monitoring programs currently in progress on the Hanford Site. This report highlights the three major operations areas (the 100, 200, and 300/1100 Areas) where wastes were discharged to the soil. Each area includes a summary discussion of the data, a well index map, and a contoured map of the water table surface.

9710 (WHC-EP–0835) **State of work for services provided by the Waste Sampling and Characterization Facility for effluent monitoring.** Gleckler, B.P. Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95007184. Source: OSTI; NTIS; INIS; GPO Dep.

This document defines the services the Waste Sampling and Characterization Facility (WSCF) shall provide Effluent Monitoring (EM) throughout the calendar year for analysis. The internal memo contained in Appendix A identifies the samples Em plans to submit for analysis in CY-1995. Analysis of effluent (liquid and air discharges) and environmental (air, liquid, animal, and vegetative) samples is required using standard laboratory procedures, in accordance with regulatory and control requirements. This report describes regulatory reporting requirements and WSCF services and data quality objectives.

9711 (WHC-SD-EN-DP–090) **Borehole data package for the 100-K area ground water wells, CY 1994.** Williams, B.A. Westinghouse Hanford Co., Richland, WA (United States). 27 Dec 1994. 523p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005628. Source: OSTI; NTIS; INIS; GPO Dep.

Borehole, hydrogeologic and geophysical logs, drilling, as-built diagrams, sampling, and well construction information and data for RCRA compliant groundwater monitoring wells installed in CY 1994 at the 100-K Basins.

9712 (WHC-SD-EN-TI–253) **Geophysical survey for proposed boreholes, 199-K-109A, 199-K-110A, and 199-K-111A, 100K Area.** Mitchell, T.H. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005099. Source: OSTI; NTIS; INIS; GPO Dep.

A survey was conducted to locate subsurface obstructions that may affect the drilling of three proposed boreholes in the 100K Area. Drill sites with the least likelihood of encountering obstructions were identified by the method of ground-penetrating radar. These results are presented in this document.

9713 (WHC-SD-EN-TP–050) **1995 Study and evaluation of fugitive and diffuse emissions from the 200 East Area at the Hanford Site.** Schmidt, J.W.; Gleckler, B.P. Westinghouse Hanford Co., Richland, WA (United States). 3 Jan 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005134. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this study is to evaluate Hanford's major diffuse emission sources in the 200 East Area and evaluate the effectiveness of monitoring these sources collectively. The results from this evaluation may also be utilized to demonstrate Westinghouse's compliance status with the applicable air emissions regulations and determine if additional studies and/or evaluations are necessary. Air sampling will be conducted downwind of the 200 East Area. This site has been chosen as being representative of most large diffuse sources located on the Hanford waste sites. A review of the 1993 ambient air data indicated that ^{137}C was detectable in this area. This study will take place during February to August of 1995. This time period will enable the collection of sufficient data to assess diffuse radionuclide emissions from the 200 East Area waste sites. This study will use existing ambient air monitoring stations supplemented with temporary air monitoring stations. Plots of the 1993 average concentrations of ^{137}Cs and ^{90}Sr collected from the existing stations may be found in Appendix A. Upon completion of this evaluation a recommendation will be made to perform additional sampling studies, or to discontinue further data gathering based on the evaluation's results.

9714 (WHC-SD-SQA-TA–20015-Rev.1) **Technical assessment of TRUSAF for compliance with work place air sampling. Revision 1.** Butler, J.D. Westinghouse Hanford Co., Richland, WA (United States). 23 Jan 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006792. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this Technical Work Document is to satisfy WHC-CM-1-6, the "WHC Radiological Control Manual." This first revision of the original Supporting Document covers the period from January 1, 1994 to December 31, 1994. WHC-CM-1-6 is the primary guidance for radiological control at Westinghouse Hanford Company (WHC). As such, it complies with Title 10, Part 835 of the Code of Federal Regulations. In addition to WHC-CM-1-6, there is HSRCM-1, the "Hanford Site Radiological Control Manual" and several Department of Energy (DOE) Orders, national consensus standards, and reports that provide criteria, standards, and requirements for workplace air sampling programs. This document provides a summary of these, as they apply to WHC facility workplace air sampling programs. this document also provides an evaluation of the compliance of the TRUSAF workplace air sampling program to the criteria, standards, and requirements and documents. Where necessary, it also indicates changes needed to bring specific locations into compliance.

9715 (WHC-SD-WM-CM–012) **Configuration management plan for the GENII software.** Rittmann, P.D. Westinghouse Hanford Co., Richland, WA (United States). 12 Dec 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005163. Source: OSTI; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020 (United States); INIS; GPO Dep.

The GENII program calculates doses from radionuclides released into the environment for a variety of possible exposure scenarios. The user prepares an input data file with the necessary modelling assumptions and parameters. The program reads the user's input file, computes the necessary doses and stores these results in an output file. The output file also contains a listing of the user's input and gives the title lines from the data libraries which are accessed in the course of the calculations. The purpose of this document is to provide users of the GENII software with the configuration controls which are planned for use by WHC in accordance with WHC-CM-3-10. The controls are solely for WHC employees. Non-WHC individuals are not excluded, but no promise is made or implied that they will be informed of errors or revisions to the software. The configuration controls cover the GENII software, the GENII user's guide, the list of GENII users at WHC, and the backup copies. Revisions to the software must be approved prior to distribution in accordance with this configuration management plan.

9716 (WHC-SD-WM-ER–399-Rev.) **Technical description of stack 296-B-10.** Ridge, T.M. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005616. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a technical description of the systems associated with the 296-B-10 stack.

9717 (WHC-SD-WM-TP–147) **Evaluating airborne radionuclide concentrations in the tank farms.** Gleckler, B.P. Westinghouse Hanford Co., Richland, WA (United States). 6 May 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005595. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this study is to determine, through the collection of grab sampling data, that an in-depth resuspension study should or should not be performed. Currently there is not enough data available to determine if a potential health hazard exists due to

resuspended contamination in the tank farms. A detailed resuspension study is currently not justified, because the limited quantity of air sample data collected does not indicate the existence of a potential health hazard.

9718 (WHC-SP–1149) **Status of outdoor radioactive contamination at the Hanford Site.** McKinney, S.M.; Markes, B.M. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005599. Source: OSTI; NTIS; INIS; GPO Dep.

This document summarizes the status of outdoor radioactive contamination near Hanford Site facilities and disposal sites. It defines the nature and areal extend of the radioactively contaminated areas and describes the historical, ongoing, and planned radiological monitoring and control activities. Radioactive waste has been disposed of to the soil column since shortly after the reactors and production facilities began operating. Radioactive liquid wastes were placed directly into the ground via liquid discharges to cribs, ponds, ditches, and reverse wells. Solid wastes were placed in trenches, burial vaults, and caissons. Although the Hanford Site covers 1,450 km^2, the radioactively contaminated area is only about 36 km^2 or 2.5% of the original site. Over time, contamination has migrated from some of the waste management sites through various vectors (e.g., burrowing animals, deep-rooted vegetation, erosion, containment system failure) or has been deposited to the surface soil via spills and unplanned releases (e.g., line leaks/breaks, tank leaks, and stack discharges) and created areas of outdoor radioactivity both on and below the surface. Currently 26 km^2 are posted as surface contamination and 10 km^2 are posted as underground contamination.

9719 (WSRC-MS–94-013) **Technetium-99, Iodine-129 and tritium in the waters of the Savannah River Site.** Beals, D.M.; Hayes, D.W. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9409282–1: The science of the total environment, Leeds (United Kingdom), 19-23 Sep 1994). Order Number DE95004803. Source: OSTI; NTIS; INIS; GPO Dep.

Surface water samples were collected from streams on and around the Savannah River Site, (SRS) to assess current ^{3}H, ^{99}Tc, and ^{129}I concentrations in the water. The SRS is a nuclear facility operated by Westinghouse Savannah River Company for the US Department of Energy. Water quality parameters were measured at the time of collection using field portable instrumentation. The tritium activity was determined by liquid scintillation spectrometry. The isotopes, ^{99}Tc and ^{129}I, were determined by isotope dilution/inductively coupled plasma-mass spectrometry. Elevated activities of ^{3}H, ^{99}Tc, and ^{129}I were found in some surface streams of the SRS, principally due to migration of ground water from beneath old seepage basins, however the levels in the waters leaving the SRS are well below any regulatory guidelines.

9720 (WSRC-RP–90-1127) **Criticality assessment of TRU burial ground culverts.** Winn, W.G. Westinghouse Savannah River Co., Aiken, SC (United States). 26 Sep 1990. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95005483. Source: OSTI; NTIS; INIS; GPO Dep.

An effort to assess the criticality risks of ^{239}Pu in TRU Burial Ground Culverts has been underway for several years. The concern arose from discrepancies in two types of monitors that have been used to assay the ^{239}Pu waste prior to storage in 55-gallon drums that are placed in the culverts. One type is the solid waste monitor (SWM), which is based on gamma-ray measurements; the other is the neutron coincidence monitor, which is based on neutron measurements. The NCC was put into routine service after 1985 and has generally yielded higher 239 Pu assays than the SWM. Culverts with pre-1986 waste only had SWM assays of ^{239}Pu; thus, it was questioned whether their actual ^{239}Pu loadings could be high enough to pose criticality concerns. Studies to characterize the culvert criticality potential have included appraisal of NCC vs SWM, neutron measurements atop the culverts, gamma-ray measurements atop the culverts, and probabilistic risk analyses. Overall, these studies have implied that the culverts are critically safe; however, their results have not been examined collectively. The present report uses the collective information of the preceding studies to arrive at a more complete assessment of the culvert criticality aspects. A conservative k_{eff} is estimated for an individual suspicious culvert and a PRA is evaluated for its "worst" drum. These two pieces of information form the basis of the appraisal, but other evidence is also included as support.

9721 (WSRC-TR–94-0225) **Quarterly sampling of the wetlands along the old F-Area effluent ditch: March 1994.** Dixon, K.L.; Cummins, C.L.; Rogers, V.A. Westinghouse Savannah River Co., Aiken, SC (United States). May 1994. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95006460. Source: OSTI; NTIS; INIS; GPO Dep.

In March 1994, well point water and near surface water (bucket) samples were collected to further characterize tritium and volatile organic compounds (VOC) in the wetlands along the old F-Area effluent ditch south of 643-E (old burial ground). Groundwater flow paths suggest that compounds detected in water table wells around 643-E would migrate towards the old F-Area effluent ditch and Fourmile Branch. Recent analytical results from near surface water sampling in the wetlands that comprise the old F-Area effluent ditch have shown that tritium and small quantities of VOCs are outcropping in the area. Results of the March 1994 sampling event further support findings that tritium and volatile organic compounds originating from 643-E are outcropping in the wetlands near the old F-Area effluent ditch. Six different analytes were detected in the well points at least once at concentrations greater than the method detection limit: d 1,2-dichloroethylene, acetone, methyl ethyl ketone, tetrachloroethylene, trichloroethylene, and tritium. 1,2-dichloroethylene, tetrachloroethylene, trichloroethylene, and tritium were detected at levels above Primary Drinking Water Standards or Maximum Contaminant Levels list. Four analytes, 1,2-dichloroethylene, trichloroethylene, tritium, and vinyl chloride, were detected at least once at concentrations greater than the method detection limit and least once at concentrations above the PDWS or the MCL. Based on differences in tritium concentrations at each location, it was determined that the sampling devices intercepted different groundwater flow paths. This negated direct comparison of analytical results between devices. However, when VOC concentrations measured at each well point and bucket location were normalized, resulting well point and bucket VOC concentrations were comparable in most cases. These results suggest that volatilization losses of VOCs from the buckets were negligible.

9722 (ANL/EA/SUMM–84626) **Activities of HPS standards committee in environmental remediation.** Stencel, J.R. (Princeton Univ., NJ (United States). Plasma Physics Lab.); Chen, S.Y. Princeton Univ., NJ (United States). Plasma Physics Lab. [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38 ; AC02-76CH03073. (CONF-941102–Summ.: Winter meeting of the American Nuclear Society, Washington, DC (United States), 13-18 Nov 1994; PPPL-CFP–3088; PPPL-CFP–3178). Order Number DE95004661. Source: OSTI; NTIS; INIS; GPO Dep.

The Health Physics Society (HPS) develops American National Standards in the area of radiation protection using methods approved by the American National Standards Institute (ANSI). Two of its sections, Environmental Health Physics and Contamination Limits, have ongoing standards development which are important to some environmental remediation efforts. This paper describes the role of the HPS standards process and indicates particular

standards under development which will be of interest to the reader. In addition, the authors solicit readers to participate in the voluntary standards process by either joining active working groups (WG) or suggesting appropriate and relevant topics which should be placed into the standards process.

9723 (CONF-940386–5) **Risk based guideline values and the development of preliminary remediation goals.** Brothers, R.A.; Cox, D.M.; Guty, J.L.; Miller, D.B.; Motheramgari, K.; Stinnette, S.E. Oak Ridge National Lab., TN (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Cost efficient acquisition and utilization of data in the management of hazardous waste sites; Herndon, VA (United States); 23-25 Mar 1994. Order Number DE95007009. Source: OSTI; NTIS; GPO Dep.

Risk managers at federal facilities often need a risk-based tool to rapidly assess the possible human health risks of large numbers of sites before completing a baseline risk assessment. Risk-based concentrations, based on Preliminary Remediation Goal (PRG) development methodology, can be used as screening guideline values. We have developed a set of guideline values (GVs) for the Mound Facility at Miamisburg, Ohio, that are risk based, decision-making tools. The GVs are used (with regulatory approval) to rapidly assess the possibility that sites may be considered for "no action" decisions. The GVs are neither PRGs nor final remedial action levels. Development of the GVs on a facilitywide basis incorporated known contaminants of potential concern, physical and chemical characteristics of contaminated media, current and potential future land uses, and exposure pathway assumptions. Because no one site was used in the development process, the GVs can be applied (after consideration of the land use and exposure potential) to any site on the facility. The facilitywide approach will streamline the PRG development process by minimizing the efforts to develop site-specific PRGs for each operable unit at a considerable saving of time and effort.

9724 (DOE/EA–0339-Draft) **Environmental assessment of remedial action at the Slick Rock uranium mill tailings sites Slick Rock, Colorado. Draft.** USDOE Albuquerque Operations Office, NM (United States). Uranium Mill Tailings Remedial Action Project Office; Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jun 1993. 114p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE93041026. Source: OSTI; NTIS; INIS; GPO Dep.

The Uranium Mill Tailings Radiation Control Act of 1978 (UMTRCA) authorized the US Department of Energy (DOE) to clean up two uranium mill tailings processing sites near Slick Rock, Colorado, in San Miguel County. The purpose of the cleanup is to reduce the potential health effects associated with the radioactive materials remaining on the sites and on vicinity properties (VP) associated with the sites. The US Environmental Protection Agency (EPA) promulgated standards for the UMTRCA that contained measures to control the contaminated materials and to protect the groundwater from further degradation. Remedial actions at the Slick Rock sites must be performed in accordance with these standards and with the concurrence of the US Nuclear Regulatory Commission (NRC).

9725 (DOE/EA–0990) **Environmental assessment for the offsite commercial cleaning of controlled and routine laundry from the Savannah River Site.** USDOE Savannah River Operations Office, Aiken, SC (United States). Dec 1994. 20p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006845. Source: OSTI; NTIS; GPO Dep.

This Environmental Assessment (EA) has been prepared by the U. S. Department of Energy (DOE) to assess the potential environmental impacts associated with the offsite commercial cleaning of controlled and routine laundry from the Savannah River Site (SRS) near Aiken, South Carolina. Controlled laundry consists of protective clothing and respirator equipment potentially containing radioactive contamination resulting from activities at SRS facilities. Routine laundry includes uncontaminated protective clothing. The aging onsite SRS laundry facility does not comply with current low hazard nuclear facility standards in DOE Order 6430.1. Constructing a new facility on site or upgrading the existing facility have prohibitive costs. The option to seek a commercial offsite vendor was selected as a viable alternative.

9726 (DOE/EIS–0195-D) **Final record of decision for remedial actions at Operable Unit 4.** USDOE Fernald Field Office, OH (United States). Dec 1994. 624p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006843. Source: OSTI; NTIS; INIS; GPO Dep.

This decision document presents the selected remedial action for Operable Unit 4 of the Fernald Site in Fernald, Ohio. This remedial action was selected in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), as amended by the Superfund Amendments and Reauthorization Act of 1986 (SARA), and to the extent practicable 40 Code of Federal Regulations (CFR) Part 300, the National Oil and Hazardous Substances Pollution Contingency Plan (NCP). For Operable Unit 4 at the FEMP, DOE has chosen to complete an integrated CERCLA/NEPA process. This decision was based on the longstanding interest on the part of local stakeholders to prepare an Environmental Impact Statement (EIS) on the restoration activities at the FEMP and on the recognition that the draft document was issued and public comments received. Therefore, this single document is intended to serve as DOE's Record of Decision (ROD) for Operable Unit 4 under both CERCLA and NEPA; however, it is not the intent of the DOE to make a statement on the legal applicability of NEPA to CERCLA actions.

9727 (DOE/EM–0200) **Albuquerque Operations Office, Albuquerque, New Mexico: Technology summary.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Office of Technology Development. Aug 1994. 213p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95002324. Source: OSTI; NTIS; INIS; GPO Dep.

This document has been prepared by the Department of Energy's (DOE) Environmental Management (EM) Office of Technology Development (OTD) in order to highlight research, development, demonstration, testing, and evaluation (RDDT&E) activities funded through the Albuquerque Operations Office. Technologies and processes described have the potential to enhance DOE's cleanup and waste management efforts, as well as improve US industry's competitiveness in global environmental markets. The information has been assembled from recently produced OTD documents that highlight technology development activities within each of the OTD program elements. These integrated program summaries include: Volatile Organic Compounds in Non-Arid Soils, Volatile Organic Compounds in Arid Soils, Mixed Waste Landfill Integrated Demonstration, Uranium in Soils Integrated Demonstration, Characterization, Monitoring, and Sensor Technology, In Situ Remediation, Buried Waste Integrated Demonstration, Underground Storage Tank, Efficient Separations and Processing, Mixed Waste Integrated Program, Rocky Flats Compliance Program, Pollution Prevention Program, Innovation Investment Area, and Robotics Technology.

9728 (DOE/EM–0222) **Oakland Operations Office, Oakland, California: Technology summary.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of the Deputy Assistant Secretary for Technology Development. Nov 1994. 99p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95003622. Source: OSTI; NTIS; INIS; GPO Dep.

DOE's Office of Technology Development manages an aggressive national program for applied research, development, demonstration, testing, and evaluation. This program develops high, payoff technologies to clean up the inventory of DOE nuclear component manufacturing sites and to manage DOE-generated waste faster, safer, and cheaper than current environmental cleanup technologies. OTD programs are designed to make new, innovative, and more effective technologies available for transfer to users through progressive development. Projects are demonstrated, tested, and evaluated to produce solutions to current problems. Transition of technologies into more advanced stages of development is based upon technological, regulatory, economic, and institutional criteria. New technologies are made available for use in eliminating radioactive, hazardous, and other wastes in compliance with regulatory mandates. The primary goal is to

protect human health and prevent further contamination. OTD technologies address three specific problem areas: (1) groundwater and soils cleanup; (2) waste retrieval and processing; and (3) pollution prevention.

9729 (DOE/RL–93-46) **RCRA Facility investigation/corrective measures study work plan for the 100-DR-2 operable unit, Hanford Site, Richland, Washington.** USDOE Richland Operations Office, WA (United States). Nov 1994. 258p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95007092. Source: OSTI; NTIS; INIS; GPO Dep.

This work plan establishes the operable unit setting and the objectives, approach, tasks, and schedule for conducting the Resource Conservation Recovery Act facility investigation/corrective measure study (RFI/CMS) for the 100-DR-2 Operable Unit in the 100 Area of the Hanford Site. This work plan is intended to cover the entire RFI/CMS program, but it is focused on limited field investigation (LFI) activities. The 100 Area is one of four areas at the Hanford Site that are on the U.S. Environmental Protection Agency's (EPA) National Priorities List under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980. The 100-DR-2 Operable Unit is one of two remaining source operable units in the 100 D/DR Area. Source operable units are those that contain facilities and unplanned release sites that are potential sources of hazardous substance contamination. In order to more efficiently manage the environmental restoration of the 100 D/DR Area, 100-DR-3 was incorporated into 100-DR-2. The 100-DR-2 contains liquid, sludge, and solid waste units that were used to support the operation of the DR Reactor. The 100-DR-3 mainly consists of solid waste burial grounds, which are presently on the interim remedial measure (IRM) pathway. The approach described in this work plan is based on the Hanford Past-Practice Strategy. This strategy streamlines the past-practice remedial action process with a bias for action through optimizing the use of interim actions. This approach culminates with decisions of final remedies on both an operable unit and 100 Area scale. The pathway selected during the scoping process for the high-priority liquid waste sites and solid waste burial grounds in the 100-DR-2 Operable Unit is the IRM pathway.

9730 (DOE-STD–1083-95) **Requesting and granting exemptions to nuclear safety rules.** USDOE, Washington, DC (United States). Feb 1995. 13p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95007451. Source: OSTI; NTIS; INIS; GPO Dep.

This standard provides an acceptable process for requesting and granting exemptions to DOE Nuclear Safety rules. The provisions of 10 CFR Part 820.63 allow DOE to determine the procedures to be used to comply with the responsibilities regarding exemption relief from DOE nuclear safety rules. The procedure in this standard defines an acceptable method for meeting these responsibilities.

9731 (ES/ER/TM–35/R1) **An introductory guide to uncertainty analysis in environmental and health risk assessment. Environmental Restoration Program.** Hammonds, J.S.; Hoffman, F.O.; Bartell, S.M. Senes Oak Ridge, Inc., TN (United States). Dec 1994. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95008097. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents guidelines for evaluating uncertainty in mathematical equations and computer models applied to assess human health and environmental risk. Uncertainty analyses involve the propagation of uncertainty in model parameters and model structure to obtain confidence statements for the estimate of risk and identify the model components of dominant importance. Uncertainty analyses are required when there is no a priori knowledge about uncertainty in the risk estimate and when there is a chance that the failure to assess uncertainty may affect the selection of wrong options for risk reduction. Uncertainty analyses are effective when they are conducted in an iterative mode. When the uncertainty in the risk estimate is intolerable for decision-making, additional data are acquired for the dominant model components that contribute most to uncertainty. This process is repeated until the level of residual uncertainty can be tolerated. A analytical and numerical methods for error propagation are presented along with methods for identifying the most important contributors to uncertainty. Monte Carlo simulation with either Simple Random Sampling (SRS) or Latin Hypercube Sampling (LHS) is proposed as the most robust method for propagating uncertainty through either simple or complex models. A distinction is made between simulating a stochastically varying assessment endpoint (i.e., the distribution of individual risks in an exposed population) and quantifying uncertainty due to lack of knowledge about a fixed but unknown quantity (e.g., a specific individual, the maximally exposed individual, or the mean, median, or 95%-tile of the distribution of exposed individuals). Emphasis is placed on the need for subjective judgement to quantify uncertainty when relevant data are absent or incomplete.

9732 (FEMP–2357) **Utilization of a hydraulic barrier to control migration of a uranium plume.** Brettschneider, D.J. (Fernald Environmental Management Project, Cincinnati, OH (United States)); Simmons, R.A. Jr.; Kappa, J.D.; Stover, J.A. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. 25 Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950216–30: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95006752. Source: OSTI; NTIS; INIS; GPO Dep.

A uranium plume emanating from the U.S. Department of Energy's Fernald Environmental Management Project (FEMP) in Fernald, Ohio had migrated off site and the leading edge of the plume had already mixed with an organic and inorganic plume emanating from two industries south of the FEMP. A method was needed to prevent the further southern migration of the plume, minimize any impacts to the geometry, concentrations, distribution or flow patterns of the organic and inorganic plumes emanating from the off-site industries, while meeting the ultimate cleanup goals for the FEMP. This paper discusses the use of a hydraulic barrier created to meet these goals by pumping a five well recovery system and the problems associated with the disposition of over 2 million gallons per day of water with low concentrations of uranium.

9733 (FEMP–2364) **A change in strategy for a CERCLA Removal Action Demolition Project in progress results in overall project enhancements.** Albertin, M.; Nichols, R.M.; Edwards, D.T. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. 25 Jan 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950216–2: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95007212. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discusses changes made in a demolition project at the Fernald Environmental Management Project (FEMP), a site on the National Priorities list (NPL), owned by the Department of Energy. The project, to demolish fourteen uranium ore silos and their structure, was based on a Removal Action Work Plan, submitted and approved by the United States Environmental Protection Agency (USEPA), that integrated Comprehensive Environmental Response Compensation and Liability Act (CERCLA) requirements to remove the source of contamination and threat to public health and the environment. After the demolition contractor defaulted at 30% complete, completion of the project by the USEPA deadline was threatened. The recovery plan included re-evaluation of project documents in addition to the schedule. It was determined that reinterpretation of the removal action criteria, including design and Removal Action Work Plan, would eliminate road-blocks, and optimize resources, resulting in project completion by the original deadline even after lost-time in mobilizing another contractor. This presentation will discuss the "lessons learned" by the project team and illustrate how simplification of construction methods resulted in enhancements to the environmental controls, improved material handing, and created a safer work environment.

9734 (FEMP–2376) **Celebrating success at Fernald.** Ofte, D.; Baublitz, J.E.; Chaney, K.; Hansen, R. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. 30 Jan 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE

Contract AC24-92OR21972. (CONF-950216–25: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95006753. Source: OSTI; NTIS; INIS; GPO Dep.

Restoration of the Fernald Environmental Management Project is now moving from the environmental investigation stage to real, tangible remediation progress. Using a variety of programmatic innovations, DOE and FERMCO continue to strengthen an effective partnership that supports a mutually-developed mission of safe, least-cost, earliest final remediation of the Fernald Site while complying with all applicable DOE Orders, regulatory requirements and commitments and addressing the concerns of the many stakeholders who have an interest in how remediation at Fernald progresses. The progress that is occurring at Fernald is testimony to a productive DOE/FERMCO partnership that will continue to be an essential part of the difficult environmental restoration task at this site.

9735 (FEMP–2379) **Accelerating D&D at Fernald: The fast track remediation design/bid package.** Houser, S.M.; Albertin, M.F.; Borgman, T.D.; Zebick, W.A. Fermi National Accelerator Lab., Batavia, IL (United States). 31 Jan 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950216–24: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95006756. Source: OSTI; NTIS; GPO Dep.

The Fernald Environmental Management Project is a Department Of Energy (DOE) facility near Cincinnati, Ohio which provided high purity uranium metal products to support United States defense programs. Production operations were halted in 1989 to focus available resources on environmental restoration activities at the facility. Operable Unit 3 (OU3) is the designation given to the production area and production-associated facilities and equipment, including, but not limited to, all above and below ground structures, equipment, and utilities. In late spring of 1994, two decisions were made that established the long range strategy on how remedial designs (RD) and the bidding of remedial actions (RA) are approached for the decontamination and decommissioning (D&D) of the Fernald facilities. The first was to fast track the remediation design and bidding process for the first three D&D packages; and the second was to use standard performance specifications to streamline the decontamination and decommissioning process. This paper describes these strategies, identifies the key elements involved, and discusses the lessons learned that were associated with the approaches. A brief synopsis of these elements follows: (1) A facility complex grouping facilities into blocks of work was used for bid packages. (2) A task force approach involving required functional organizations was used to fast track the design and bidding process. (3) Standard Performance Specifications have been developed for each task to establish minimum acceptable criteria and provide the subcontractor flexibility. This approach also dramatically decreases costs for future D&D packages. (4) A key feature of value engineering has been the use of construction methods and techniques to drive the D&D cost significantly lower. (5) The bid package was structured around a modified IFB approach. This provides the successful bidder the opportunity to incorporate innovative ideas within the performance.

9736 (FEMP–2380) **Technology development and applications at Fernald.** Pettit, P.J. (Fermco, Cincinnati, OH (United States)); Skriba, M.C.; Warner, R.D. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950216–26: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95006757. Source: OSTI; NTIS; INIS; GPO Dep.

At the Fernald Environmental Management Project (FEMP) northwest of Cincinnati, Ohio, the U.S. Department of Energy and contractor Fernald Environmental Restoration Management Corporation (FERMCO) are aggressively pursuing both the development and the application of improved, innovative technology to the environmental restoration task. Application of emerging technologies is particularly challenging in a regulatory environment that places pressure on operational managers to develop and meet tight schedules. The regulatory and operational needs make close communication essential between technology developers and technology users (CERCLA/RCRA Unit managers). At Fernald this cooperation and communication has led, not only to the development and demonstration of new technologies with applications at other sites, but also to application of new technologies directly to the Fernald clean up. New technologies have been applied to improve environmental safety and health, improve the effectiveness of restoration efforts, and to cut restoration costs. The paper will describe successful efforts to develop and apply new technologies at the FEMP and will emphasize those technologies that have been applied and are planned for use in the clean up of this former uranium production facility.

9737 (LA–12899-MS) **Radionuclide concentrations in fish collected from Jemez, Nambe, and San Ildefonso Tribal Lakes.** Fresquez, P.R.; Armstrong, D.R.; Salazar, J.G. Los Alamos National Lab., NM (United States). Feb 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95007724. Source: OSTI; NTIS; INIS; GPO Dep.

Radionuclide concentrations (^{90}Sr, ^{137}Cs, ^{238}Pu, ^{239}Pu,and total uranium) were determined in fish collected from Jemez, Nambe, and San Ildefonso tribal lakes. With the exception of ^{137}Cs, all other radionuclides were not significantly different in (stocked) rainbow trout collected from Jemez and Nambe as compared with game fish collected from Abiquiu, Heron, and El Vado Reservoirs. Although ^{137}Cs levels in trout from Jemez (3.2×10^{-2} pCi per dry gram) and Nambe (7.5×10^{-2} pCi per dry gram) were significantly higher than ^{137}Cs concentrations in fish from Abiquiu, Heron, and El Vado, they were still well below the regional statistical (worldwide fallout) reference level (i.e., $< 28 \times 10^{-2}$ pCi per dry gram). Game and nongame fish collected from San Ildefonso contained higher and significantly higher concentrations of uranium, respectively, as compared with fish collected from Abiquiu, Heron, and El Vado. The higher uranium concentrations in fish from San Ildefonso as compared with fish from Abiquiu, Heron, and El Vado were attributed to the higher natural soil uranium contents in the area as compared with the geology of the area upstream of San Ildefonso. The effective (radiation) dose equivalent (EDE) from consuming 46 lb of game fish from Jemez, Nambe, and San Ildefonso lakes, after natural background has been subtracted, was 0.013 (±0.002), 0.019 (±0.012), and 0.017 (±0.028) mrem/yr, respectively. Similarly, the EDE from consuming nongame fish from San Ildefonso was 0.0092 (±0.0084) mrem/yr. The highest calculated dose, based on the mean + 2 standard deviation (95% confidence level), was 0.073 mrem/yr; this was <0.08% of the International Commission on Radiological Protection permissible dose limit for protecting members of the public.

9738 (LA-UR–93-4029-Rev.) **Grading standards, prepared by the Configuration Management Office.** Cort, G.; Donahue, S.; Frank, J.; Perkins, B.; Wrye, J. Los Alamos National Lab., NM (United States). 28 Jan 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95005583. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the grading methodology used by the organization to determine the required levels of configuration management for all controlled elements that are part of the nuclear facility and its operation. The goal is to have a flexible grading system that accurately reflects the overall operational environment. The grading methodology should identify which items, processes, and information should be incorporated into facility baselines as controlled elements; and specify the level of formality that should be applied to activities that employ or impact these controlled elements. Evaluation categories include the following: radiological damage to workers; toxicological damage to workers; industrial safety; environmental damage; property damage; facility availability; cost effect; reputation; and commitments.

9739 (LA-UR–95-212) **Citizen advisory boards: An empirical model for choosing goals and methods.** Kunsberg, P. Los Alamos National Lab., NM (United States). Dec 1994. 85p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006292. Source: OSTI; NTIS; INIS; GPO Dep.

This is a study of Citizen Advisory Boards (CABS) undertaken for the Department of Energy (DOE) to draw practical insights from the accumulated experience of CAB members and agency officials who have worked with these boards over many years. Hence the main research tool is in-depth interviews of these individuals. In addition, the study relies on field observations of CABs at work, historical documentation of individual boards, and a large body of academic, professional, and government literature. The DOE is in the process of establishing Site Specific Advisory Boards (SSABs) at most of its major facilities in order to provide for community involvement in the DOE environmental restoration and environmental management programs, but these boards initiated by DOE do not yet have enough of a track-record for a study of this type. Consequently, the study focused on CABs at six other federal agencies which have had substantial experience with boards that are similar in composition and purpose to the SSABs. The study examined common problem that confront virtually every CAB in its organization and its decision-making process. For example, each board faces difficult issues in defining its goals and representational responsibilities, selection of members, selection of issues, reaching agreement on recommendations to the parent agency, getting responsive action from the parent agency, and evaluating the board's success over time. An effort was made to identify solutions or best approaches to these fundamental problems such that the recommended approach has broad application to citizen advisory boards concerned with environmental issues. The conclusions of the study are summarized in a model which incorporates the optimal approaches discovered with respect to each of the critical issues. While acknowledging that the particular circumstances of a CAB may call for individual variations, the model provides a fairly comprehensive description of recommended features of a CAB.

9740 (NUREG/CR–6310) **An analysis of potassium iodide (KI) prophylaxis for the general public in the event of a nuclear accident.** Behling, H. (S. Cohen & Associates, Inc., McLean, VA (United States)); Behling, K.; Amarasooriya, H.; Kotsch, J. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Technology; Cohen (S.) and Associates, Inc., McLean, VA (United States); SCIENTECH, Inc., Rockville, MD (United States). Feb 1995. 210p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS.

A generic difficulty encountered in cost-benefit analyses is the quantification of major elements that define the costs and the benefits in commensurate units. In this study, the costs of making KI available for public use, and the avoidance of thyroidal health effects predicted to be realized from the availability of that KI (i.e., the benefits), are defined in the commensurate units of dollars.

9741 (ORNL/ENG/TM–52) **Correlation of heat transfer in a cylinder containing uranium hexafluoride engulfed in a fire.** Anderson, J.C. Oak Ridge National Lab., TN (United States). Aug 1994. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. USECHQ-93-C-0001. Order Number DE95001382. Source: OSTI; NTIS; GPO Dep.

Transient heat transfer/stress analysis models are currently being developed to evaluate the response of cylinders containing uranium hexafluoride (UF_6) to fire accident scenarios. In order to accurately predict temperatures within the cylinder, and ultimately elapsed time to failure, the heat transfer to and within the cylinder must be well characterized. This report contains a complete set of heat transfer correlations required for such a model. Correlations are presented for predicting heat transfer rates over the cylinder exterior (radiative exchange and natural convection), from the cylinder interior to the various phases of UF_6 (solid, liquid, and vapor) in the cylinder, between UF_6 phases in the cylinder, and during UF_6 liquid boiling. The heat transfer coefficients predicted by these correlations were chosen based on best engineering judgement and have not yet been compared to data from actual cylinder fire tests.

9742 (ORNL/TM–12772) **In situ treatment of mixed contaminants in groundwater: Review of candidate processes.** Korte, N.E. (ed.) (Oak Ridge National Lab., Grand Junction, CO (United States)); Siegrist, R.L. (ed.); Ally, M. Oak Ridge National Lab., TN (United States). Oct 1994. 112p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ESD–4290). Order Number DE95002442. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division Publication No. 4290.

This document describes the screening and preliminary evaluation of candidate treatment for use in treating mixed contaminants volatile organic compounds (VOCs) and radionuclides in groundwater. Treating mixed contaminants presents unusual difficulties. Typically, VOCs are the most abundant contaminants, but the presence of radionuclides results in additional health concerns that must be addressed, usually by a treatment approach different from that used for VOCs. Furthermore, the presence of radionuclides may yield mixed solid wastes if the VOCs are treated by conventional means. These issues were specifically addressed in the evaluation of candidate treatment processes for testing in this program. Moreover, because no research or early development of a particular process would be performed, the technology review also focused on technologies that could be readily adapted and integrated for use with mixed contaminants. The objective is to couple emerging or available processes into treatment modules for use in situ. The three year project, to be completed in September 1996, includes a full-scale field demonstration. The findings reported in this document encompass all activities through the treatment process evaluations.

9743 (PNL–10190) **Evaluation of unit risk factors in support of the Hanford Remedial Action Environmental Impact Statement.** Strenge, D.L.; Chamberlain, P.J. II. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 248p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95004187. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the generation of unit risk factors for use with the Graphical Information System (GIS) being developed by Advanced Sciences, Inc. for the Hanford Remedial Action Environmental Impact Statement. The GIS couples information on source inventory and environmental transport with unit risk factors to estimate the potential risk from contamination at all locations on the Hanford Site. The major components of the effort to generate the unit risk factors were: determination of pollutants to include in the study, definition of media of concern, and definition of exposure assessment scenarios, methods, and parameters. The selection of pollutants was based on inventory lists which indicated the pollutants likely to be encountered at the known waste sites. The final pollutants selected included 47 chemical pollutants and 101 radionuclides. Unit risk factors have been generated for all 148 pollutants per unit initial concentration in five media: soil (per unit mass), soil (per unit area), air, groundwater, and surface water. The exposure scenarios were selected as the basis for the unit risk factor generation. The endpoint in the exposure assessment analysis is expressed as risk of developing cancer for radionuclides and carcinogenic chemicals. For noncarcinogenic chemicals, the risk endpoint is the hazard quotient. The cancer incidence and hazard quotient values are evaluated for all exposure pathways, pollutants, and scenarios. The hazard index values and unit risk values are used by the GIS to produce maps of risk for the Hanford Site.

9744 (PNL–10423) **Environmental surveillance master sampling schedule.** Bisping, L.E. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 82p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95007635. Source: OSTI; NTIS; INIS; GPO Dep.

Contains one map.

Environmental surveillance of the Hanford Site and surrounding areas is conducted by the Pacific Northwest Laboratory (PNL) for the U.S. Department of Energy (DOE). This document contains the planned 1994 schedules for routine collection of samples for the Surface Environmental Surveillance Project (SESP), Drinking Water Project, and Ground-Water Surveillance Project. Samples are routinely collected for the SESP and analyzed to determine the quality of air, surface water, soil, sediment, wildlife, vegetation, foodstuffs, and farm products at Hanford Site and surrounding communities. The responsibility for monitoring onsite drinking water falls outside the scope of the SESP. PNL conducts the drinking water monitoring project concurrent with the SESP to promote efficiency and consistency, utilize expertise developed over the years, and reduce

costs associated with management, procedure development, data management, quality control, and reporting. The ground-water sampling schedule identifies ground-water sampling .events used by PNL for environmental surveillance of the Hanford Site. Sampling is indicated as annual, semi-annual, quarterly, or monthly in the sampling schedule. Some samples are collected and analyzed as part of ground-water monitoring and characterization programs at Hanford (e.g. Resources Conservation and Recovery Act (RCRA), Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), or Operational). The number of samples planned by other programs are identified in the sampling schedule by a number in the analysis column and a project designation in the Cosample column. Well sampling events may be merged to avoid redundancy in cases where sampling is planned by both-environmental surveillance and another program.

9745 (PNL-SA–24002) **Field test of six-phase soil heating at the Savannah River Site.** Gauglitz, P.A. (and others); Roberts, J.S.; Bergsman, T.M. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941124–11: 33. Hanford symposium on health and the environment: symposium on in-situ remediation–scientific basis for current and future technologies, Richland, WA (United States), 7-11 Nov 1994). Order Number DE95007167. Source: OSTI; NTIS; INIS; GPO Dep.

Six-Phase Soil Heating (SPSH) was demonstrated as a viable technology for heating low permeability soils containing volatile organic contaminants as part of the Volatile Organic Compounds in Non-Arid Soils Integrated Demonstration (VOC Non-Arid ID) at the Savannah River Site. The soil at the integrated demonstration site is contaminated with perchloroethylene (PCE) and trichloroethylene (TCE); the highest soil contamination occurs in clay rich zones that are ineffectively treated by conventional soil vapor extraction due to the very low permeability of the clay. The SPSH demonstration sought to heat the clay zone and enhance the performance of conventional soil vapor extraction. Thermocouples at 30 locations quantified the areal and vertical heating within the treated zone. Results show successful heating of the targeted clay zone that contained the higher levels of soil contamination. The clay-zone temperatures increased to 1,000 C after 8 days of heating and were maintained near 1,000 C for 17 days. Electrical heating removed 17,000 gal of water from the soil as steam, with peak removal rate of 1,500 gpd of condensed steam.

9746 (PNL-SA–24239) **Modular risk analysis for assessing multiple waste sites.** Whelan, G. (Pacific Northwest Lab., Richland, WA (United States)); Buck, J.W.; Nazarali, A. Pacific Northwest Lab., Richland, WA (United States). Jun 1994. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9406226–2: DOE integrated workshop from strategic planning to baseline and other objectives, Golden, CO (United States), 1-2 Jun 1994). Order Number DE95004972. Source: OSTI; NTIS; INIS; GPO Dep.

Human-health impacts, especially to the surrounding public, are extremely difficult to assess at installations that contain multiple waste sites and a variety of mixed-waste constituents (e.g., organic, inorganic, and radioactive). These assessments must address different constituents, multiple waste sites, multiple release patterns, different transport pathways (i.e., groundwater, surface water, air, and overland soil), different receptor types and locations, various times of interest, population distributions, land-use patterns, baseline assessments, a variety of exposure scenarios, etc. Although the process is complex, two of the most important difficulties to overcome are associated with (1) establishing an approach that allows for modifying the source term, transport, or exposure component as an individual module without having to re-evaluate the entire installation-wide assessment (i.e., all modules simultaneously), and (2) displaying and communicating the results in an understandable and useable maimer to interested parties. An integrated, physics-based, compartmentalized approach, which is coupled to a Geographical Information System (GIS), captures the regional health impacts associated with multiple waste sites (e.g., hundreds to thousands of waste sites) at locations within and surrounding the installation. Utilizing a modular/GIS-based approach overcomes difficulties in (1) analyzing a wide variety of scenarios for multiple waste sites, and (2) communicating results from a complex human-health-impact analysis by capturing the essence of the assessment in a relatively elegant manner, so the meaning of the results can be quickly conveyed to all who review them.

9747 (PNL-SA–24315) **Innocuous oil as an additive for reductive reactions involving zero valence iron.** Cary, J.W.; Cantrell, K.J. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941124–12: 33. Hanford symposium on health and the environment: symposium on in-situ remediation–scientific basis for current and future technologies, Richland, WA (United States), 7-11 Nov 1994). Order Number DE95007159. Source: OSTI; NTIS; INIS; GPO Dep.

Reductive reactions involving zero valence iron appear to hold promise for in situ remediation of sites containing chlorinated hydrocarbon solvents and certain reducible metals and radionuclides. Treatment involves the injection of metallic iron and the creation of low levels of dissolved oxygen in the aqueous phase through oxidation of the metallic iron. The use of a biodegradable immiscible and innocuous organic liquid such as vegetable oil as an additive offers several intriguing possibilities. The oil phase creates a large oil-water interface that is immobile with respect to flow in the aqueous phase. This phase will act as a trap for chlorinated hydrocarbons and could potentially increase the reaction efficiency of reductive dehalogenation of chlorinated hydrocarbons by the metallic iron. When iron particles are suspended in the oil before injection they are preferentially held in the oil phase and tend to accumulate at the oil-water interface. Thus oil injection can serve as a mechanism for creating a stable porous curtain of metallic iron in the vadose to maintain a low oxygen environment which will minimize the consumption of the iron by molecular oxygen.

9748 (PNL-SA–24455) **Developmental issues in environmental reporting protocols.** Schrock, D.W. (Pacific Northwest Lab., Richland, WA (United States)); Stoops, J.L.; Meier, A.K.; Vine, E.L.; Solomon, B.D. Pacific Northwest Lab., Richland, WA (United States). Aug 1994. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9408169–4: American Council for Energy-Efficient Economy (ACEEE) summer conference, Asilomar, CA (United States), 28 Aug - 3 sep 1994). Order Number DE95004955. Source: OSTI; NTIS; GPO Dep.

In this paper, we review the policy differences and associated reporting and verification protocols between three energy and/or environmental reporting programs in the United States, specifically the Conservation Verification Protocols (CVP) - a voluntary set of procedures for reporting acid rain reductions from energy conservation, the Greenhouse Gas Voluntary Reporting Program (GGVRP) to acknowledge greenhouse gas-reducing activities, and a national database on energy efficiency programs (DEEP) an informational database on utility demand-side management (DSM) programs. The most important lesson learned in developing these reporting programs is that the accuracy of the program for reporting energy savings activities is dependent upon both the estimation and verification protocols used in the program and the mapping procedures used to generate emission impacts from energy savings. Additionally, the types of protocols that may be used in the program depend upon who is participating in the program. The free market can also be a useful tool in determining how much money reporting entities want to spend on energy savings and emissions reductions estimation and verification protocols by placing a dollar value on atmospheric emissions. After such programs are implemented, the program managers should ensure that an iterative, quality control process is utilized. The reporters of such information must be made aware that their numbers will be reviewed carefully and will be questioned for accuracy. Finally, the accuracy and confidence of the reported information should be reviewed on a periodic basis to ensure that the goals and expectations of the program and the reporting entities are being met.

9749 (PNL-SA–24675) **Physical chemistry and the environment.** Dunning, T.H. Jr.; Garrett, B.C.; Kolb, C.E. Jr.; Shaw, R.W.; Choppin, G.R.; Wagner, A.F. Pacific Northwest Lab., Richland, WA (United States). Aug 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830.

(CONF-930802–23: 206. American Chemical Society (ACS) national meeting, Chicago, IL (United States), 22-27 Aug 1993). Order Number DE95005723. Source: OSTI; NTIS; INIS; GPO Dep.

From the ozone hole and the greenhouse effect to plastics recycling and hazardous waste disposal, society faces a number of issues, the solutions to which require an unprecedented understanding of the properties of molecules. We are coming to realize that the environment is a coupled set of chemical systems, its dynamics determining the welfare of the biosphere and of humans in particular. These chemical systems are governed by fundamental molecular interactions, and they present chemists with an unparalleled challenge. The application of current concepts of molecular behavior and of up-to-date experimental and computational techniques can provide us with insights into the environment that are needed to mitigate past damage, to anticipate the impact of current human activity, and to avoid future insults to the environment. Environmental chemistry encompasses a number of separate, yet interlocking, areas of research. In all of these areas progress is limited by an inadequate understanding of the underlying chemical processes involved. Participation of all chemical approaches – experimental, theoretical and computational – and of all disciplines of chemistry – organic, inorganic, physical, analytical and biochemistry – will be required to provide the necessary fundamental understanding. The Symposium on "Physical Chemistry and the Environment" was designed to bring the many exciting and challenging physical chemistry problems involved in environmental chemistry to the attention of a larger segment of the physical chemistry community.

9750 (PNL-SA–24683) **Transport of radioactive ions in soil by electrokinetics.** Buehler, M.F.; Surma, J.E.; Virden, J.W. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941016–4: Materials week '94, Rosemont, IL (United States), 3-7 Oct 1994). Order Number DE95004911. Source: OSTI; NTIS; INIS; GPO Dep.

An electrokinetic approach is being evaluated for in situ soil remediation at the Hanford Site in Richland, Washington. This approach uses an applied electric field to induce transport of both radioactive and hazardous waste ions in soil. The work discussed in this paper involves the development of a new method to monitor the movement of the radioactive ions within the soil during the electrokinetic process. A closed cell and a gamma counter were used to provide iii situ measurements of ^{137}Cs and ^{60}Co movement in Hanford soil. Preliminary results show that for an applied potential of 200 V over approximately 200 hr, ^{137}Cs and $^{60}60$ were transported a distance of 4 to 5 in. The monitoring technique demonstrated the feasibility of using electrokinetics for soil separation applications.

9751 (PNL-SA–25469) **Remediation of contaminated subsurface materials by a metal-reducing bacterium.** Gorby, Y.A.; Amonette, J.E.; Fruchter, J.S. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941124–10: 33. Hanford symposium on health and the environment: symposium on in-situ remediation–scientific basis for current and future technologies, Richland, WA (United States), 7-11 Nov 1994). Order Number DE95004924. Source: OSTI; NTIS; INIS; GPO Dep.

A biotic approach for remediating subsurface sediments and groundwater contaminated with carbon tetrachloride (CT) and chromium was evaluated. Cells of the Fe(iii)-reducing bacterium strain BrY were added to sealed, anoxic flasks containing Hanford groundwater, natural subsurface sediments, and either carbon tetrachloride, CT, or oxidized chromium, Cr(VI). With lactate as the electron donor, BrY transformed CT to chloroform (CF), which accumulated to about 1 0 % of the initial concentration of CT. The remainder of the CT was transformed to unidentified, nonvolatile compounds. Transformation of CT by BrY was an indirect process Cells reduced solid phase Fe(ill) to chemically reactive FE(II) that chemically transformed the chlorinated contaminant. Cr(VI), in contrast, was reduced by a direct enzymatic reaction in the presence or absence of Fe(III)-bearing sediments. These results demonstrate that Fe(ill)-reducing bacteria provide potential for transforming CT and for reducing CR(VI) to less toxic Cr(III). Technologies for stimulating indigenous populations of metal-reducing bacteria or for introducing specific metal-reducing bacteria to the subsurface are being investigated.

9752 (RFP–4900) **Adsorption study for uranium in Rocky Flats groundwater.** Laul, J.C. (EG and G Rocky Flats, Inc., Golden, CO (United States)); Rupert, M.C.; Harris, M.J.; Duran, A. EG and G Rocky Flats, Inc., Golden, CO (United States). Jan 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90RF62349. (CONF-950570–7: International high-level radioactive waste management conference: progress toward understanding, Las Vegas, NV (United States), 1-5 May 1995). Order Number DE95006141. Source: OSTI; NTIS; INIS; GPO Dep.

Six adsorbents were studied to determine their effectiveness in removing uranium in Rocky Flats groundwater. The bench column and batch (Kd) tests showed that uranium can be removed (>99.9%) by four adsorbents. Bone Charcoal (R1O22); F-1 Alumina (granular activated alumina); BIOFIX (immobilized biological agent); SOPBPLUS (mixed metal oxide); Filtrasorb 300 (granular activated carbon); and Zeolite (clinoptilolite).

9753 (SAND–94-2364) **Proceedings of the High Consequence Operations Safety Symposium.** Sandia National Labs., Albuquerque, NM (United States). Dec 1994. 551p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-940788–: High consequence operations safety symposium, Albuquerque, NM (United States), 12-14 Jul 1994). Order Number DE95004959. Source: OSTI; NTIS; GPO Dep.

Many organizations face high consequence safety situations where unwanted stimuli due to accidents, catastrophes, or inadvertent human actions can cause disasters. In order to improve interaction among such organizations and to build on each others' experience, preventive approaches, and assessment techniques, the High Consequence Operations Safety Symposium was held July 12–14, 1994 at Sandia National Laboratories, Albuquerque, New Mexico. The symposium was conceived by Dick Schwoebel, Director of the SNL Surety Assessment Center. Stan Spray, Manager of the SNL System Studies Department, planned strategy and made many of the decisions necessary to bring the concept to fruition on a short time scale. Angela Campos and about 60 people worked on the nearly limitless implementation and administrative details. The initial symposium (future symposia are planned) was structured around 21 plenary presentations in five methodology-oriented sessions, along with a welcome address, a keynote address, and a banquet address. Poster papers addressing the individual session themes were available before and after the plenary sessions and during breaks.

9754 (SAND–95-0014C) **Environmental Measurement-While-Drilling system for real-time field screening of contaminants.** Lockwood, G.J.; Normann, R.A.; Bishop, L.B.; Floran, R.J.; Williams, C.V. Sandia National Labs., Albuquerque, NM (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9504114–1: North American no-dig '95, Toronto (Canada), 30 Apr - 3 may 1995). Order Number DE95005428. Source: OSTI; NTIS; INIS; GPO Dep.

Sampling during environmental drilling is essential to fully characterize the spatial distribution and migration of near surface contaminants. However, the analysis of these samples is not only expensive, but can take weeks or months when sent to an off-site laboratory. In contrast, measurement-while-drilling (MWD) screening capability could save money and valuable time by quickly distinguishing between contaminated and uncontaminated areas. Real-time measurements provided by a MVM system would enable on-the-spot decisions to be made regarding sampling strategies, enhance worker safety, and provide the added flexibility of being able to "steer" the drill bit in or out hazardous zones. During measurement-while-drilling, down-hole sensors are located behind the drill bit and linked by a rapid data transmission system to a computer at the surface. As drilling proceeds, data are collected on the nature and extent of the subsurface contamination in real-time. The down-hole sensor is a Geiger-Mueller tube (GMT) gamma radiation detector. In addition to the GMT signal, the MWD system monitors these required down-hole voltages and two temperatures

associated with the detector assembly. The Gamma Ray Detection System (GRDS) and electronics package are discussed in as well as the results of the field test. Finally, our conclusions and discussion of future work are presented.

9755 (SAND–95-0070C) **Innovative site characterization demonstration saves time and money.** Floran, R.J. (Sandia National Labs., Albuquerque, NM (United States)); Bujewski, G.E.; Johnson, R.L. Sandia National Labs., Albuquerque, NM (United States); Argonne National Lab., IL (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950216–18: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95006225. Source: OSTI; NTIS; INIS; GPO Dep.

A technology demonstration that optimizes sampling strategies and real-time data collection was carried out at the Kirtland Air Force Base RB-11 Radioactive Burial Site, Albuquerque, New Mexico in August 1994. The project, which was funded by the Strategic Environmental Research and Development Program (SERDP), involved the application of a geostatistical-based "smart sampling" methodology and software with on-site field screening of soils for radiation, organic compounds and metals. The software, known as Plume™, was developed at Argonne National Laboratory as part of the DOE/OTD-funded Mixed Waste Landfill Integrated Demonstration (MWLID). The objective of the investigation was to compare an innovative Adaptive Sampling approach that stressed real-time decision-making with a conventional RCRA-driven site characterization carried out by the Air Force. The latter investigation used a standard drilling and sampling plan as mandated by the EPA. To make the comparison realistic, the same contractors and sampling equipment (Geoprobe® soil samplers) were used. In both investigations, soil samples were collected at several depths at numerous locations adjacent to burial trenches that contain low-level radioactive waste and animal carcasses. Neither study revealed the presence of contaminants appreciably above risk based action levels, indicating that minimal to no migration has occurred away from the trenches. The combination of Adaptive Sampling with field screening achieved a similar level of confidence compared to the RCRA investigation regarding the potential migration of contaminants at the site. By comparison, the Adaptive Sampling program drilled 28 locations (vs. 36 for the conventional investigation), collected 81 samples (vs. 163), and sent 15 samples (vs. 163) off-site for laboratory analysis. In addition, the field work took 3 1/2 days compared to 13 days for the RCRA investigation.

9756 (UCRL-CR–116511-94-4) **Use of international data sets to evaluate and validate pathway assessment models applicable to exposure and dose reconstruction at DOE Facilities. Progress report, June 1994–September 1994.** Hoffman, F.O. (SENES Oak Ridge Inc., TN (United States). Center for Risk Analysis). Lawrence Livermore National Lab., CA (United States). 1 Nov 1994. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95006142. Source: OSTI; NTIS; GPO Dep.

The purpose of this work is to evaluate and validate pathway assessment models applicable to exposure and dose reconstruction at DOE facilities through the use of international data sets. This report contains summaries of progress made in the months of June, July, August, and September, 1994.

9757 (WHC-MR–0487) **Type B investigation of electrical fault in 351 Substation, December 4, 1994.** Debban, H.L. (ICF Kaiser Hanford Co., Richland, WA (United States)); Shearer, C.A.; Boger, R.M.; McDonald, G.P.; Eyre, L.E.; Dell, L.D.; Kelly, D.S. Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 259p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95007183. Source: OSTI; NTIS; INIS; GPO Dep.

On December 4, 1994, at 2132:10 hours, an electrical failure of a cable-tapping splice resulted in a fire in the 300 Area of the DOE Hanford Site. The fire occurred in the yard of Substation 351 in electrical Vault R122V, where the cable-tapping splice was located. The fire incinerated all cables passing to and through the vault causing them to fail. The failure of the cables resulted in a power outage to twenty customers in the 300 Area. The vault was electrically isolated, and power was restored to the electrical distribution system at 2311 hours. This report contains the accident scenario, accident analysis, direct cause and root and contributing causes.

9758 (WHC-SA–2745) **Lessons learned during the development and conduct of exercise Fermont.** Faulk, S.M. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950430–3: 5. ANS topical meeting on emergency preparedness and response, Savannah, GA (United States), 18-21 Apr 1995). Order Number DE95004973. Source: OSTI; NTIS; INIS; GPO Dep.

On September 22–23, 1993, the DOE, Richland Operations Office (RL) in Richland, Washington conducted a major field exercise named Fremont. This exercise tested the ability of the Site emergency organization and the State and local emergency organizations in both Washington and Oregon to take the appropriate actions to mitigate a major emergency and to protect the citizens of the region. The exercise involved initial emergency activities as well as intermediate and late phase actions including relocation and ingestion activities. A major element of the exercise was the participation of the Federal Radiological Monitoring and Assessment Center (FRMAC). This was the first major exercise that a DOE site requested a full FRMAC participation in a nonclassified environment.

9759 (WHC-SD-CP-ANAL–010) **Attachments for fire modeling for Building 221-T, T Plant canyon deck and railroad tunnel.** Oar, D.L. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Hughes Associates, Inc., Columbia, MD (United States). 23 Jan 1995. 166p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006711. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this attachment is to provide historical information and documentation for Document No. WHC-SD-CP-ANAL-008 Rev 0, "Fire Modeling for Building 221-T–T Plant Canyon Deck and Railroad Tunnel", dated September 29, 1994. This data compilation contains the following: Resumes of the Technical Director, Senior Engineer and Junior Engineer; Review and Comment Record; Software Files; CFAST Input and Output Files; Calculation Control Sheets; and Estimating Sprinkler Actuation Time in the Canyon and Railroad Tunnel. The T Plant was originally a fuel reprocessing facility. It was modified later to decontaminate and repair PuRex process equipment.

9760 (WHC-SD-CP-HSP–002) **PUREX Deactivation Health and Safety documentation.** Dodd, E.N. III. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 130p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005082. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the PUREX Deactivation Project is to establish a passively safe and environmentally secure configuration of PUREX at the Hanford Site, and to preserve that configuration for a 10-year horizon. The 10-year horizon is used to predict future maintenance requirements and represents they typical time duration expended to define, authorize, and initiate the follow-on Decontamination and Decommissioning (D&D) activities. This document was prepared to increase attention to worker safety issues during the deactivation project and, as such, identifies the documentation and programs associated with PUREX Deactivation Health and Safety.

9761 (WHC-SD-CP-SA–027) **Seismic analysis of safety class 1 incinerator glovebox in building 232-Z 200 W Area.** Ocoma, E.C. Westinghouse Hanford Co., Richland, WA (United States). Sep 1994. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005280. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the seismic evaluation for the existing safety class 1 incinerator glovebox in 232Z Building. The glovebox is no longer in use and most of the internal mechanical equipment have been removed. However, the insulation firebricks are still in the glovebox for proper disposal.

9762 (WHC-SD-CP-TR–006) **Engineering Phase 2 and Phase 3 certification programs – PUREX deactivation.** Waiser,

R.L. Westinghouse Hanford Co., Richland, WA (United States). 13 Dec 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005133. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the training programs required to become a Phase 2 and Phase 3 certified engineer at PUREX during deactivation. With the change in mission, the PUREX engineering/certification training program is being revamped as discussed below. The revised program will be administered by PUREX Technical Training using existing courses and training materials. The program will comply with the requirements of the Department of Energy (DOE) order 5480.20A, "Personnel Selection, Qualification, Training, and Staffing Requirements at DOE Reactor and Non-Reactor Nuclear Facilities."

9763 (WHC-SD-EN-RA–007) **Qualitative risk assessment for the 100-HR-3 groundwater operable unit.** Vukelich, S.E. (Golder Associates, Inc., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Golder Associates, Inc., Richland, WA (United States). 22 Sep 1994. 173p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005405. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides the qualitative risk assessment for the 100-HR-3 operable unit on the Hanford Reservation. 100-HR-3 is a ground water unit. The purpose of the QRA at the 100-HR-3 operable unit is to focus on a predefined set of human and environmental exposure scenarios in order to provides sufficient information that will assist the Tri-Party signatories (Washington State Department of Ecology, EPA and US DOE) in making defensible decisions on the necessity of Interim Remedial Measures. Frequent- and occasional-use exposure scenarios are evaluated in the human health risk assessment to provide bounding estimates of risk. The ecological risk assessment consists of an evaluation of the risks to riparian and aquatic receptors which live in or near the Columbia River.

9764 (WHC-SD-FF-PSE–002) **Preliminary safety evaluation (PSE) for Sodium Storage Facility at the Fast Flux Test Facility.** Bowman, B.R. Westinghouse Savannah River Co., Aiken, SC (United States). 30 Sep 1994. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95001541. Source: OSTI; NTIS; INIS; GPO Dep.

This evaluation was performed for the Sodium Storage Facility (SSF) which will be constructed at the Fast Flux Test Facility (FFTF) in the area adjacent to the South and West Dump Heat Exchanger (DHX) pits. The purpose of the facility is to allow unloading the sodium from the FFTF plant tanks and piping. The significant conclusion of this Preliminary Safety Evaluation (PSE) is that the only Safety Class 2 components are the four sodium storage tanks and their foundations. The building, because of its imminent risk to the tanks under an earthquake or high winds, will be Safety Class 3/2, which means the building has a Safety Class 3 function with the Safety Class 2 loads of seismic and wind factored into the design.

9765 (WHC-SD-GN-ER–30034) **Photos of deficiencies found during roof inspection.** McCoy, R.M. Westinghouse Hanford Co., Richland, WA (United States). 13 Sep 1994. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005162. Source: OSTI; NTIS; INIS; GPO Dep.

This report shows photos of roof deficiencies noted during roof inspections conducted since 1992 at the Hanford Site.

9766 (WHC-SD-GN-FHA–30001) **Fire hazards analysis and safety analysis report requirements.** Evans, C.B. Westinghouse Hanford Co., Richland, WA (United States). 4 Oct 1994. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95003057. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides technical criteria for the development of Fire Hazards Analyses for WHC-managed facilities, particularly those facilities which require safety analysis documentation.

9767 (WHC-SD-L097-ATP–005) **Project 93L-EWL-097, fire alarm system improvements, 300 Area.** Scott, M.V. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005608. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains the Acceptance Test Procedure (ATP) which will demonstrate that the modifications to the Fire Protection systems in the 338 Building function as intended. The ATP will test the fire alarm control panel, flow alarm pressure switch, post indicator valve tamper switch, heat detectors, flow switches, and fire alarm signaling devices.

9768 (WHC-SD-RE-SEL–001-Rev.2) **Purex plant safety equipment list for deactivation. Revision 2.** Walser, R.L. Westinghouse Hanford Co., Richland, WA (United States). 30 Nov 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004484. Source: OSTI; NTIS; GPO Dep.

This document provides a list of equipment and/or systems essential to the continuing safety of the PUREX facility during DEACTIVATION. The basis for the safety equipment list (SEL) is provided in WHC-SD-RD-022 Rev 1. Equipment selection is based on WHC-CM-1-3, MRP 5.46 as implemented by WHC-CM-4-46, Section 9.0. Format: The safety equipment list is divided into two sections: (1) Process Equipment and (2) Process Instrumentation. Only section (1) is included in this document.

9769 (WHC-SD-SNF-ATP–006) **Acceptance test procedure for the MO-293 (1722) 10-wide mobile office.** Wallace, S.C. Westinghouse Hanford Co., Richland, WA (United States). 28 Dec 1994. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006791. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance Test Procedure has been prepared to demonstrate that the Fire Protection System functions as required by project criteria. The test results will be issued as an acceptance test report after all the testing is complete. This facility is part of the Spent Nuclear Fuel Project. An appendix is provided as a checklist of activities to be performed by the fire alarm system installer to ensure proper installation and operation.

9770 (WHC-SD-SNF-ES–006) **An assessment of KW Basin radionuclide activity when opening SNF canisters.** Bergmann, D.W. (Westinghouse Hanford Co., Richland, WA (United States)); Mollerus, F.J.; Wray, J.L. Westinghouse Hanford Co., Richland, WA (United States); Mollerus Engineering Corp., Los Gatos, CA (United States). 6 Feb 1995. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95007173. Source: OSTI; NTIS; INIS; GPO Dep.

N Reactor spent fuel is being stored in sealed canisters in the KW Basin. Some of the canisters contain damaged fuel elements. There is the potential for release of Cs 137, Kr 85, H3, and other fission products and transuranics (TRUs) when canisters are opened. Canister opening is required to select and transfer fuel elements to the 300 Area for examination as part of the Spent Nuclear Fuel (SNF) Characterization program. This report estimates the amount of radionuclides that can be released from Mark II spent nuclear fuel (SNF) canisters in KW Basin when canisters are opened for SNF fuel sampling as part of the SNF Characterization Program. The report also assesses the dose consequences of the releases and steps that can be taken to reduce the impacts of these releases.

9771 (WHC-SD-SNF-RA–001) **K Basin safety analysis.** Porten, D.R.; Crowe, R.D. Westinghouse Hanford Co., Richland, WA (United States). 16 Dec 1994. 128p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005100. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this accident safety analysis is to document in detail, analyses whose results were reported in summary form in the K Basins Safety Analysis Report WHC-SD-SNF-SAR-001. The safety analysis addressed the potential for release of radioactive and non-radioactive hazardous material located in the K Basins and their supporting facilities. The safety analysis covers the hazards associated with normal K Basin fuel storage and handling

operations, fuel encapsulation, sludge encapsulation, and canister clean-up and disposal. After a review of the Criticality Safety Evaluation of the K Basin activities, the following postulated events were evaluated: Crane failure and casks dropped into loadout pit; Design basis earthquake; Hypothetical loss of basin water accident analysis; Combustion of uranium fuel following dryout; Crane failure and cask dropped onto floor of transfer area; Spent ion exchange shipment for burial; Hydrogen deflagration in ion exchange modules and filters; Release of Chlorine; Power availability and reliability; and Ashfall.

9772 (WHC-SD-SNF-SARR–002-Rev.3) **Safety assessment of discharge chute isolation barrier preparation and installation activities. Revision 3.** Meichle, R.H. Westinghouse Hanford Co., Richland, WA (United States). 8 Nov 1994. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005292. Source: OSTI; NTIS; INIS; GPO Dep.

This revision adds a section addressing impacts of dropping surfacing tool and rack cutter on the basin floor, and corrects typographical errors. The safety assessment is made for the activities for the preparation and installation of the discharge chute isolation barriers. The safety assessment includes a hazard assessment and comparisons of potential accidents/events to those addressed by the current safety basis documentation. No significant hazards were identified. An evaluation against the USQ evaluation questions was made and the determination made that the activities do not represent a USQ. Hazard categorization techniques were used to provide a basis for readiness review classifications.

9773 (WHC-SD-SNF-TA–005) **Safety evaluation – Spent water treatment system components inventory release.** Dodd, E.N. Jr. Westinghouse Hanford Co., Richland, WA (United States). 24 Jan 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006793. Source: OSTI; NTIS; INIS; GPO Dep.

Over the past few years various impediments to shipment of generated spent basin water treatment system components have resulted in the accumulation of quantities of these waste items at 100K. Specifically, there are (as of 01/01/95) 13 grout/culvert packaged cartridge filters (CF), four unpackaged cartridge filters, 60 spent ion exchange columns (IXC) and seven ion exchange modules (IXM) at 100K awaiting shipment for final waste disposal. As a result of the accumulation of this waste, the question has arisen regarding the consequences of potential releases of the inventory of radionuclides in these waste items relative to the K Area safety envelope. The purpose of this paper is to address this question. The initial step evaluating the consequences of potential release of material from the spent water treatment system components was to determine the individual and total radionuclide inventories of concern. Generally the radioisotopes of concern to the dose consequences were Sr/Y-90, Cs-137, and the transuranic (TRU) isotopes. The loading of these radioisotopes needed to be determined for each of the components of the total number of accumulated IXCs, IXMs and CFs. This evaluation examines four potential releases of material from the spent water treatment system components. These releases are: the release of material from all 39 IXCs stored in 183-KW; the release of material from the IXCs, IXMs and CFs at 105-KE and 105-KW; the release of material from the 13 CFs stored behind 105-KE; and the non-mechanistic release of the total stored waste inventory.

9774 (WHC-SD-W025-RPT–003) **Interim safety basis compliance matrix for Trenches 31 and 34.** Ames, R.R. Westinghouse Hanford Co., Richland, WA (United States). 30 Dec 1994. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005137. Source: OSTI; NTIS; INIS; GPO Dep.

The tables provided in this document identify the specific requirements and basis for the administrative controls established in the Westinghouse Hanford Company (WHC) Solid Waste Burial Ground (SWBG) Interim Safety Basis (ISB) for operation of the Project W-025, Mixed Waste Lined Landfill (Trenches 31 and 34). The tables document the necessary controls and implementing procedures to ensure compliance with the requirements of the ISB. These requirements provide a basis for future Unreviewed Safety Questions (USQ) screening of applicable procedure changes, proposed physical modifications, tests, experiments, and occurrences. Table 1 provides the SWBG interim Operational Safety Requirements administrative controls matrix. The specific assumptions and commitments used in the safety analysis documents applicable to disposal of mixed wastes in Trenches 31 and 34 are provided in Table 2. Table 3 is provided to document the potential engineered and administrative mitigating features identified in the Preliminary Hazard Analysis (PHA) for disposal of mixed waste.

9775 (WHC-SD-W272-HC–001-Rev.1) **Special case waste hazard categorization. Revision 1.** Armstrong, D.L. Westinghouse Hanford Co., Richland, WA (United States). 2 Feb 1995. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95007221. Source: OSTI; NTIS; INIS; GPO Dep.

In this document, the hazard categorization is determined for activities associated with Project W-272, Special Case Waste (SWC) Storage Modules that will be placed on concrete slabs in the Solid Waste Operations Complex (SWOC) in the 200 West Area of the Hanford site. In this categorization, the activities that take place within the boundaries of the SWOC are addressed; therefore, only the receipt, offloading, handling, and storing of the Special Case Waste at the SWOC are of concern. This revision updates the radioactive material inventory, reverses the assumption that the SCW meets the criteria of Packaging and Transportation of Radioactive Materials (10 CFR 71), Section 71.75, Qualification of Special Form Radioactive Material, and evaluates the project based upon the criteria and guidance provided by US Department of Energy (DOE)-STD-1027-92, Hazard Categorization and Accident Analysis Techniques for Compliance with DOE Order 5480.23, Nuclear Safety Analysis Reports. The Pacific Northwest Laboratory Building 324 B-Cell waste inventory consists of reactor fuel, irradiated fuel, fuel cladding, and vitrified forms of these fuel elements. The waste contains no toxic chemicals or hydrogenous materials. The proposed storage method is placement of the SCW in special waste overpacks (SWOs) that are then placed in a vendor-provided canister that is then placed in prefabricated, reinforced-concrete structures. These structures meet the requirements of Licensing Requirements for the Independent Storage of Spent Nuclear Fuel and High-Level Radioactive Waste (10 CFR 72) and serve as a monitored retrievable storage (MRS) installation.

9776 (WHC-SD-WM-OTR–172) **B-Plant canyon fire foam supply. Report.** Gainey, T. Westinghouse Hanford Co., Richland, WA (United States). 26 Jan 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006903. Source: OSTI; NTIS; INIS; GPO Dep.

A new raw water supply was installed for the B-Plant fire foam system. This document details tests which were performed to demonstrate that the system can function as designed. The tests included: verification of the operation of the automatic valves at the cells; measurement of water flow and pressure downstream of the proportioner; production of foam, and measurement of foam concentration. Included as an appendix is a copy of the work package resolution (J4 and J4a) which has been signed off as completed.

9777 (WHC-SD-WM-SARR–031) **Safety analysis for push-mode and rotary-mode core sampling.** Milliken, N.J.; Geschke, G.R. Westinghouse Hanford Co., Richland, WA (United States). 30 Jan 1995. 107p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006909. Source: OSTI; NTIS; INIS; GPO Dep.

This safety analysis analyzes using the push-mode core sampling truck in the push-mode and the rotary-mode core sampling trucks in both the push- and rotary-modes to retrieve core samples that, once taken and analyzed, will yield waste characterization data for the hazardous waste tanks at the Hanford Site. Operation of the core sampling trucks in both the push- and rotary-modes was reviewed to determine whether the release of radioactive materials could occur during operation. It was concluded that there are three credible scenarios: a sample spill outside of the tank, a steam release event, and an unfiltered release to the environment during continuous exhauster operation. The probability of a sample spill was found to be 10^{-4}/event, the probability of a steam release event was determined to fall in the unlikely range (10^{-2}/

event to 10^{-4}/event), and the probability of an unfiltered release was calculated to be 5×10^{-3}/year. Typically, events with probabilities of 10^{-6}/event or less are not considered to be risk significant, and the consequences usually are not analyzed. The three accident scenarios were analyzed to calculate the dose consequences. It was determined that the steam release event is the bounding accident. The onsite and offsite dose consequences for this event are calculated to be 0.24 Sv (24 rem) and 3.2×10^{-4} Sv (32 mrem), respectively. These consequences are below the risk acceptance guidelines for an unlikely event, as established in WHC-CM-4-46, Nonreactor Facility Safety Analysis Manual. With the design features and the use of the controls presented in Section 8.0, this operation represents a minimal risk.

9778 (WHC-SD-WM-TI-638) **Preliminary flowsheet: Ion exchange for separation of cesium from Hanford tank waste using resorcinol-formaldehyde resin.** Penwell, D.L. Westinghouse Hanford Co., Richland, WA (United States). 28 Dec 1994. 169p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005101. Source: OSTI; NTIS; INIS; GPO Dep.

This preliminary flowsheet document describes an ion exchange process which uses resorcinol-formaldehyde (R-F) resin to remove cesium from Hanford tank waste. The flowsheet describes one possible equipment configuration, and contains mass balances based on that configuration with feeds of Neutralized Current Acid Waste, and Double Shell Slurry Feed. The flowsheet also discusses process alternatives, unresolved issues, and development needs associated with the ion exchange process. It is expected that this flowsheet will evolve as open issues are resolved and progress is made on development needs. This is part of the Tank Waste Remediation Program at Hanford. 26 refs, 6 figs, 25 tabs.

9779 (WHC-SD-WM-WP-174-Rev.1) **Engineering work plan for tank 241-C-103 vapor phase characterization (ECN 613188). Revision 1.** Conrad, R.B. Westinghouse Hanford Co., Richland, WA (United States). 5 Oct 1994. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002157. Source: OSTI; NTIS; GPO Dep.

The tasks described by this work plan have been completed. The purpose of this revision it to document what actually occurred during the performance of this work plan. The scope was and is limited to phases 1 and 2 as described in the program plan, revision 1. Phases 1 and 2 include the tank 241-C-103 (C-103) vapor. For economic and as low as reasonably achievable (ALARA) reasons, we will limit our scope to characterize the C-103 vapor phase for the categories that could be expected to impact facility worker safety from a toxicological and flammability standpoint. In anticipation that a vapor treatment system may be required, categories necessary for design will also be included. It will be the intent of the C-103 vapor characterization program to: (1) identify the substances from the above list of categories that are applicable to the issues involving C-103, and (2) implement a phased plan which will develop the organic vapor phase characterization method and then characterize the organics and the other selected substances to the required quantitative certainty.

9780 (WHC-SD-WM-WP-292) **Video requirements plan for the HMT equipment removal system.** Vargo, G.F. Jr. Westinghouse Hanford Co., Richland, WA (United States). 1 Feb 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006783. Source: OSTI; NTIS; INIS; GPO Dep.

This document is the plan defining the video coverage requirements for the equipment removal event of the Hydrogen Mitigation Test (HMT) mixer pump currently installed in high level nuclear waste storage Tank 241-SY-101. When the mixer pump fails the removal and installation of a spare pump will be a time critical event. Since the success of the HMT mixer pump has resolved the DOE safety issue it is absolutely essential that mixing be restored to the tank in a short as time possible. Therefore, the removal of the failed pump and the installation of the spare pump must be anticipated and planned well in advance. The removal, containment, transporting, and storage of the failed pump is a very complex and hazardous task. The successful completion of this task will require careful planning and monitoring. Certain events, during the removal and subsequent installation of the new pump, will require video observation and storage for safety, documenting, training, and promotional use. Furthermore, certain events will require close monitoring and observation by the event directors and key supervisory personnel for the execution of specific tasks during the equipment removal event.

9781 (WSRC-MS-94-0522) **Smart implementation of worker safety emergency preparedness programs at DOE non-nuclear facilities.** O'Kula, K.R.; Lightner, J.W.; Salaymeh, S.R. Westinghouse Savannah River Co., Aiken, SC (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950430–1: 5. ANS topical meeting on emergency preparedness and response, Savannah, GA (United States), 18-21 Apr 1995). Order Number DE95001894. Source: OSTI; NTIS; GPO Dep.

The Westinghouse Savannah River Company (WSRC), as a management and operations contractor for the US Department of Energy (DOE), operates a number of non-reactor facilities at the Savannah River Site (SRS) for the separation, processing, storage, and disposition of nuclear materials. In many SRS facilities, chemicals are present alone or in proximity to nuclear inventories, so that the associated emergency preparedness planning for these facilities must also consider the hazards posed by collateral chemical inventories. Recent process safety management and environmental protection elements have been established by the Occupational Safety and Health Administration (OSHA) and the Environmental Protection Agency (EPA), including those requiring emergency planning and response to mitigate the consequences of catastrophic releases. Although DOE non-nuclear facilities are not bound by outside agency rulemaking, the adoption of OSHA standards is prescribed by DOE Orders 5480.4 and 5483.IA and is mandatory for DOE chemical processes affected by the process safety management rule (PSM rule). This paper presents an overview of key strategies to comply with the emergency management PSM element for non-nuclear facilities. The approach uses the graded approach philosophy (DOE-STD-3009-94) and Hazard Classification Guidelines (DOE Order 5481.1 B) to cost effectively meet compliance criteria. Key strategies include: (1) hazard analysis team consolidation; (2) best estimate chemical dispersion code calculations; and, where valid, (3) knowledge-based decision analysis modeling to more accurate follow accident progression in complex, multi-barrier non-nuclear facilities.

9782 (WSRC-MS-94-0595) **Radiological consequences of a propagated fire accident in a radiochemical separations facility.** Hope, E.P.; Ades, M.J. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950439–4: SMS simulation multiconference: simulation as a critical technology, Phoenix, AZ (United States), 9-13 Apr 1995). Order Number DE95005485. Source: OSTI; NTIS; INIS; GPO Dep.

A radiological consequence analysis of a propagated fire accident in a Savannah River Site (SRS) radiochemical separations facility has been performed. This analysis supports the safety documentation for the SRS plutonium reprocessing facility. Included are the evaluation of the doses resulting from the exposure to the radioactive airborne release for co-located facility worker and the off-site individual receptors. Atmospheric dispersion calculations using qualified five-year (1987-1991) meteorological data were performed with the computer code AXAIR89Q, a validated computer code for radiological dose calculations. Radioactive source term estimates and assumptions of material composition and isotope distribution were based on existing permissible storage levels as defined in approved safety documentation. The fire accident scenario assumes that the fire propagates in the entire facility on four structural levels. Approximately 97% of the radioactive materials released occurs from levels three and four of the facility, which are not included in the ventilation pathway to the sand trap filter. Radiological analysis results indicate that the doses to co-located worker and off-site individual receptors are equal to 4.4 rem and 3.3 rem, respectively. Accident mitigators that were identified include provision for filtration capacity from levels three and four of the facility, and relocation of stored radioactive materials. Provision

for filtration capacity would reduce the source term from an unfiltered activity of 53.6 Ci to a filtered activity of 2.0 Ci. Relocation of stored radioactive materials would result in a source term reduction from 53.6 Ci to 20 Ci. Limitations exist, however, that may make implementation of the identified mitigators difficult or prohibitive.

9783 (WSRC-MS–94-0641) **Incineration of Low Level Radioactive Vegetation for Waste Volume Reduction.** Malik, N.P.S.; Rucker, G.G.; Looper, M.G. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–36: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95060089. Source: OSTI; NTIS; INIS; GPO Dep.

The DOE changing mission at Savannah River Site (SRS) are to increase activities for Waste Management and Environmental Restoration. There are a number of Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) locations that are contaminated with radioactivity and support dense vegetation, and are targeted for remediation. Two such locations have been studied for non-time critical removal actions under the National Contingency Plan (NCP). Both of these sites support about 23 plant species. Surveys of the vegetation show that radiation emanates mainly from vines, shrubs, and trees and range from 20,000 to 200,000 d/m beta gamma. Planning for removal and disposal of low-level radioactive vegetation was done with two principal goals: to process contaminated vegetation for optimum volume reduction and waste minimization, and for the protection of human health and environment. Four alternatives were identified as candidates for vegetation removal and disposal: chipping the vegetation and packing in carbon steel boxes (lined with synthetic commercial liners) and disposal at the Solid Waste Disposal Facility at SRS; composting the vegetation; burning the vegetation in the field; and incinerating the vegetation. One alternative 'incineration' was considered viable choice for waste minimization, safe handling, and the protection of the environment and human health. Advantages and disadvantages of all four alternatives considered have been evaluated. For waste minimization and ultimate disposal of radioactive vegetation incineration is the preferred option. Advantages of incineration are that volume reduction is achieved and low-level radioactive waste are stabilized. For incineration and final disposal vegetation will be chipped and packed in card board boxes and discharged to the rotary kiln of the incinerator. The slow rotation and longer resident time in the kiln will ensure complete combustion of the vegetative material.

9784 (WSRC-MS–95-0056) **Development of Plasma Vitrification Technology for Contaminated Soil at the Savannah River Site.** Kielpinski, A.L. (Westinghouse Savannah River Co., Aiken, SC (United States)); Marra, J.C.; Rogers, V.; Schumacher, R.F.; Etheridge, J.; Kirkland, R. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–35: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95060091. Source: OSTI; NTIS; INIS; GPO Dep.

The Mixed Waste Integrated Program (MWIP) of the United States Department of Energy's Office of Technology Development is developing treatment technologies for a wide variety of materials containing mixed low-level waste, i.e., having low levels of radioactivity along with hazardous constituents. Vitrification is a promising treatment technology for many of these wastes, including contaminated soil such as that found at the Savannah River Site. Proof-of-principle tests were performed to demonstrate the feasibility of both ex-situ and in-situ vitrification of contaminated soil by means of a plasma torch. A mixture of 89 percent as-excavated Savannah River Site sandy clay loam with 11 percent lime addition was tested. Vitrification of a mixture of this feed, in a 10 in. diameter crucible with a non-transferred arc plasma torch at a nominal 160 kW, was successful. The process produced homogeneous glass (albeit with local compositional variations), surrounded by a skull of incompletely reacted feed. Characterization of the resultant product durability using the Product Consistency Test showed elemental leaching well below the Environmental Assessment glass (which is often used as a minimum standard of glass acceptability in high-level waste glass assessment) for both the glass and the skull regions. Future tests should include doping the soil with hazardous constituents to enable further verification of the wasteform integrity via the Toxic Characteristic Leaching Procedure. In-situ operation was mimicked in the test crucible by segregating the lime additive from the soil within the crucible. Making full use of the available torch maneuvering capabilities (which would likely exceed those of a torch used in-situ) failed to produce a homogeneous melt. Therefore, intimate mechanical mixture of the additive with the soil appears crucial to the success of SRS soil vitrification, and must be included in design considerations for in-situ operation.

9785 (WSRC-RP–93-1155) **Federal Facility Agreement progress report.** Westinghouse Savannah River Co., Aiken, SC (United States). Oct 1993. 108p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95002666. Source: OSTI; NTIS; INIS; GPO Dep.

The (SRS) Federal Facility Agreement (FFA) was made effective by the US. Environmental Protection Agency Region IV (EPA) on August 16, 1993. To meet the reporting requirements in Section XXV of the Agreement, the FFA Progress Report was developed. The FFA Progress Report is the first of a series of quarterly progress reports to be prepared by the SRS. As such this report describes the information and action taken to September 30, 1993 on the SRS units identified for investigation and remediation in the Agreement. This includes; rubble pits, runoff basins, retention basin, seepage basin, burning pits, H-Area Tank 16, and spill areas.

9786 (WSRC-TR–94-0538) **Determination of frequencies of contamination and fire related incidents for DWPF SAR.** Hovis, G.L.; Harvel, C.D.; Abear, J.W.; Sims, C.H. Westinghouse Savannah River Co., Aiken, SC (United States). 15 Nov 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95005481. Source: OSTI; NTIS; INIS; GPO Dep.

At the request of the Risk Analysis group (RAG), and in support of the DWPF SAR, the Safety Information Management and Analysis group (SIMA) determined specific frequency and unavailability values dealing with contamination and fire related incidents. All results summarized herein are based upon actual facility operating data from the 200-Area Fault Tree Data Bank. The SAS statistical package was utilized to compute annual frequencies from appropriate event data. All calculations have been technically reviewed to ensure that they are accurate mathematical representations of actual operating history as recorded in the data bank.

9787 (WSRC-TR–95-0009) **Decontamination Study for Mixed Waste Storage Tanks RCRA Closure.** Leaphart, D.M. (Bechtel Savannah River, Inc., Aiken, SC (United States)); Reed, S.R.; Rankin, W.N. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–50: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95060094. Source: OSTI; NTIS; INIS; GPO Dep.

Customer called 1/18/95, due date was typed incorrectly (2/25/95), should have been 1/25/95-notified DOE.tb.

The Savannah River Site (SRS) plans to close six underground tanks storing mixed waste under RCRA regulations. In support of this closure effort, a study was performed to determine the optimal method of decontaminating these tanks to meet the closure requirements. Items consaidered in the evaluation of the decontamination methods included effectiveness, compatibility with existing waste residues, possible cleaning solution disposal methods, and cost.

0550 Safeguards, Inspection, and Accountability

9788 (LA-UR–94-3750) **Independent technical review of the Mound Plant.** Los Alamos National Lab., NM (United States). Jun 1994. 253p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95003728. Source: OSTI; NTIS; GPO Dep.

This report documents an Independent Technical Review (ITR) of the facilities, organizations, plans, and activities required to transition particular elements of the Mound Plant from Defense Program (DP) funded operation as appropriate either to community developed reuse or safe deactivation leading to decontamination and decommissioning (D&D). The review was conducted at the request of the Dr. Willis Bixby, Deputy Assistant Secretary, U.S. Department of Energy EM-60, Office of Facility Transition and Management and is a consensus of the nine member ITR Team. Information for the review was drawn from documents provided to the ITR Team by the Miamisburg Area Office (MB) of the DOE, EG&G, the City of Miamisburg, and others; and from presentations, discussions, interviews, and facility inspections at the Mound Plant during the weeks of March 14 and March 28, 1994. During the week of April 25, 1994, the ITR Team met at Los Alamos, New Mexico to develop consensus recommendations. A presentation of the core recommendations was made at the Mound Plant on May 5, 1994. This is an independent assessment of information available to, and used by, the Mound Plant personnel. Repetition of the information is not meant to imply discovery by the ITR Team. Team members, however, acting as independent reviewers, frequently assess the information from a perspective that differs significantly from that of the Mound Plant personnel. The report is based on information obtained and conditions observed during the March 1994 review interval. The ITR process and normal site work often initiate rapid, beneficial changes in understanding and organization immediately following the review. These changes frequently alter conditions observed during the review, but the report does not address changes subsequent to the review interval.

9789 (NUREG–1497) **Interim licensing criteria for physical protection of certain storage of spent fuel.** Dwyer, P.A. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Fuel Cycle Safety and Safeguards. Nov 1994. 12p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

This document presents interim criteria to be used in the physical protection licensing of certain spent fuel storage installations. Installations that will be reviewed under this criteria are those that store power reactor spent fuel at decommissioned power reactor sites; independent spent fuel storage installations located outside of the owner controlled area of operating nuclear power reactors; monitored retrievable storage installations owned by the Department of Energy, designed and constructed specifically for the storage, of spent fuel; the proposed geologic repository operations area; or permanently shutdown power reactors still holding a Part 50 license. This criteria applies to both dry cask and pool storage. However, the criteria in this document does not apply to the storage of spent fuel within the owner-controlled area of operating nuclear power reactors.

9790 (SAND–93-1834C) **Portable reconfigurable line sensor (PRLS) and technology transfer.** MacKenzie, D.P. (Air Force Electronic Systems Center, Hanscom AFB, MA (United States)); Buckle, T.H.; Blattman, D.A. Sandia National Labs., Albuquerque, NM (United States); Electronic Systems Div., L.G. Hanscom Field, MA (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789 ; AI04-79AL11812. (CONF-9308223–2: 1. annual symposium on coupling technology to national needs, Albuquerque, NM (United States), 23-27 Aug 1993). Order Number DE95006863. Source: OSTI; NTIS; INIS; GPO Dep.

The Portable Reconfigurable Line Sensor (PRLS) is a bistatic, pulsed-Doppler, microwave intrusion detection system developed at Sandia National Laboratories for the US Air Force. The PRLS is rapidly and easily deployed, and can detect intruders ranging from a slow creeping intruder to a high speed vehicle. The system has a sharply defined detection zone and will not falsely alarm on nearby traffic. Unlike most microwave sensors, the PRLS requires no alignment or calibration. Its portability, battery operation, ease of setup, and RF alarm reporting capability make it an excellent choice for perimeter, portal, and gap-filler applications in the important new field of rapidly-deployable sensor systems. In October 1992, the US Air Force and Racon, Inc., entered into a Cooperative Research and Development Agreement (CRADA) to commercialize the PRLS, jointly sharing government and industry resources. The Air Force brings the user's perspective and requirements to the cooperative effort. Sandia, serving as the technical arm of the Air Force, adds the actual PRLS technology to the joint effort, and provides security systems and radar development expertise. Racon puts the Air Force requirements and Sandia technology together into a commercial product, making the system meet important commercial manufacturing constraints. The result is a true "win-win" situation, with reduced government investment during the commercial development of the PRLS, and industry access to technology not otherwise available.

9791 (WHC-SD-C217-ES–001) **Plutonium finishing plant safeguards and security systems replacement study.** Klear, P.F.; Humphrys, K.L. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 227p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006658. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the preferred alternatives for the replacement of the Safeguards and Security systems located at the Hanford Plutonium Finishing Plant.

9792 (WHC-SD-CP-TI–194) **UO_3 plant turnover - facility description document.** Clapp, D.A. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005075. Source: OSTI; NTIS; INIS; GPO Dep.

This document was developed to provide a facility description for those portions of the UO_3 Facility being transferred to Bechtel Hanford Company, Inc. (BHI) following completion of facility deactivation. The facility and deactivated state condition description is intended only to serve as an overview of the plant as it is being transferred to BHI.

9793 (WHC-SD-WM-FHA–003) **Fire hazards analysis for the uranium oxide (UO_3) facility.** Wyatt, D.M. Westinghouse Hanford Co., Richland, WA (United States). 6 Dec 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005138. Source: OSTI; NTIS; INIS; GPO Dep.

The Fire Hazards Analysis (FHA) documents the deactivation end-point status of the UO_3 complex fire hazards, fire protection and life safety systems. This FHA has been prepared for the Uranium Oxide Facility by Westinghouse Hanford Company in accordance with the criteria established in DOE 5480.7A, Fire Protection and RLID 5480.7, Fire Protection. The purpose of the Fire Hazards Analysis is to comprehensively and quantitatively assess the risk from a fire within individual fire areas in a Department of Energy facility so as to ascertain whether the objectives stated in DOE Order 5480.7, paragraph 4 are met. Particular attention has been paid to RLID 5480.7, Section 8.3, which specifies the criteria for deactivating fire protection in decommission and demolition facilities.

9794 (WSRC-MS–94-0489) **In-bed accountability of tritium in production scale metal hydride storage beds.** Klein, J.E. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950506–1: 5. topical meeting on tritium technology in fission, fusion and isotopic applications, Ispra (Italy), 28 May - 3 jun 1995). Order Number DE95006459. Source: OSTI; NTIS; INIS; GPO Dep.

An "in-bed accountability" (IBA) flowing gas calorimetric measurement method has been developed and implemented to eliminate the need to remove tritium from production scale metal hydride storage beds for inventory measurement purposes. Six-point tritium IBA calibration curves have been completed for two, 390 gram tritium metal hydride storage beds. The calibration curves for the two tritium beds are similar to those obtained from the "cold" test program. Tritium inventory errors at the 95 percent confidence level ranged from $\pm$ 7.3 to 8.6 grams for the cold test results compared to $\pm$ 4.2 to 7.5 grams obtained for the two tritium calibrated beds.

9795 (EGG-M–94302) **Overview of commercial low-level radioactive waste disposal in the United States.** Smith, P. Idaho National Engineering Lab., Idaho Falls, ID (United States). 1994. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-940748–98: 35. annual meeting of the Institute of Nuclear Materials Management (INMM), Naples, FL (United States), 17-20 Jul 1994). Order Number DE95005024. Source: OSTI; NTIS; INIS; GPO Dep.

Disposal of commercial low-level radioactive waste (LLW) is a critical part of the national infrastructure needed to maintain the health of American businesses, universities, and hospitals. Currently only 19 States (located in the Northwest and Southeast) have access to operating disposal facilities; all other States are storing their LLW until they open new disposal facilities on their own or in concert with other States through regional compact agreements. In response to recommendations from the National Governors Association, Congress assigned the burden for LLW disposal to all States, first in 1980 through Public Law 96-573, the "Low-level Radioactive Waste Policy Act", and again in 1986 through Public Law 99-240, the "Low-Level Radioactive Waste Policy Amendments Act of 1985". As directed by Congress, the Department of Energy provides technical assistance to States and compact regions with this task. After almost 14 years, nine compact regions have been ratified by Congress; California, Texas, North Carolina, and Nebraska have submitted license applications; California has issued an operating license; and the number of operating disposal facilities has decreased from three to two.

9796 (IAEA-INFCIRC–92(mod.2)) **The text of the safeguards transfer agreement relating to the bilateral agreement between Spain and the United States of America.** International Atomic Energy Agency, Vienna (Austria). Feb 1994. 14p. (In Chinese, English, French, Russian, Spanish Order Number DE95623460. Source: OSTI; NTIS (US Sales Only); INIS.

The text of the Protocol suspending the application of safeguards pursuant to the Safeguards Transfer Agreement of 9 December 1966, as amended, between the Agency, Spain and the United States of America is reproduced in this document for the information of all Members. The Protocol entered into force, pursuant to Section 3 thereof, on 15 October 1993.

9797 (IAEA-INFCIRC–225(rev.3)) **The physical protection of nuclear material.** International Atomic Energy Agency, Vienna (Austria). Sep 1993. 177p. (In Arabic, Chinese, English, French, Russian, Order Number DE95623455. Source: OSTI; NTIS (US Sales Only); INIS.

Technical Committee met 21-25 June 1993 to consider changes to INFCIRC/225/Rev.2. The revised document, INFCIRC/225/Rev.3, reflects the Technical Committee recommendations for changes to the text as well as other modifications determined necessary to advance the consistency of the Categorization Table in INFCIRC/225/Rev.2 with the categorization table contained in The Convention of the Physical Protection of Nuclear Material and to reflect additional improvements presented by the experts. The recommendations presented in this IAEA document reflect a broad consensus among Member States on the requirements which should be met by systems for the physical protection of nuclear materials and facilities. It is hoped that they will provide helpful guidance for Member States.

9798 (IAEA-INFCIRC–433(mod.1)) **Agreement with the government of India for the application of safeguards to all nuclear material subject to Agency safeguards under INFCIRC/154, part I and the agreements between India and the IAEA contained in exchanges of letters dated 1 October and 1 December 1993.** International Atomic Energy Agency, Vienna (Austria). Nov 1994. 33p. (In Arabic, Chinese, English, French, Russian, Order Number DE95623456. Source: OSTI; NTIS (US Sales Only); INIS.

The text of the Exchange of Letters, constituting the amendment to the Agreement with the Government of India for the Application of Safeguards to all nuclear material subject to Agency safeguards under INFCIRC/154, Part I, and the Agreements between India and the IAEA contained in Exchanges of Letters dated 1 October and 1 December 1993, is reproduced in this document for the information of all Members. The amendment to the Agreement was approved by the Agency's Board of Governors on 12 September 1994. The amendment to the Agreement entered into force, pursuant to the Exchange of Letters, on 12 September 1994.

9799 (INIS-mf–14457, pp. 37-41) **The rules of licensing of the radio-sterilized materials for medical use.** Achmatowicz, T. (Instytut Lekow, Warsaw (Poland)). Institute of Nuclear Chemistry and Technology, Warsaw (Poland). 1993. 127p. (In Polish). (CONF-9311284–: Autumn school on sterilization of medical materials: actual state and development perspectives, new international regulations, Warsaw (Poland), 18-19 Nov 1993). In *Autumn school. Radiation of medical materials. Actual state and development perspectives, new international regulations. 18-19 November 1993.* Order Number DE95620176. Source: OSTI; NTIS; INIS.

Requirements and procedure for licensing the radiation sterilized materials from the view point of Polish regulations have been described. The Institute of Pharmacy is the institution responsible for that process. A number of control test should be performed before the material is permitted for medical use. This problem has been discussed for different kinds of sterilized materials. 1 tab.

9800 (INIS-mf–14457, pp. 43-48) **International recommendations connected with radiosterilization.** Kaluska, I. (Institute of Nuclear Chemistry and Technology, Warsaw (Poland)). The actual state of international legislation process connected with rules of radiation sterilization have been presented. The International Organization for Standardization is responsible for this process and elaboration of proper documents. The document entitled "Sterilization of health care products - requirement for validation and routine control -radiation sterilization" being a result of the Working Group 2 of ISO Technical Committee activity has been presented. The internationally accepted recommendations and licensing procedure have been described. Differences in rules and standards obliged locally up to now in different countries have been also discussed. 1 fig.

9801 (INIS-mf–14469, pp. 23-48) **On the implementation of 1990 ICRP recommendations.** Gomaa, M.A.; Elnaggar, A.M. Atomic Energy Establishment, Cairo (Egypt). 1991. 106p. (CONF-9110549–: 2. radiation protection and Civil Defence Department Conference, Cairo (Egypt), 7-16 Oct 1991). In *Radiation Protection and Civil defence Department Conference.* Order Number DE95617966. Source: OSTI; NTIS (US Sales Only); INIS.

The international commission on radiological protection (ICRP) adopted new recommendations on radiation protection in November 1990. These recommendations are based on the latest radiation risk estimates derived from the reanalysis of the atomic bomb survivor data and other epidemiological studies. These recommendations are published in 1991 as ICRP publication 60. Based on biological aspects, the commission adopted a multidimensional concept of 'detriment', and assessed the distribution of detriment in organs and tissues. This introduced new terminologies and some changes in tissue weighting factors. The important feature of the new ICRP recommendations is the introduction of new dose limits for the control of Occupational exposure, and control of public exposure. This treatise presents a concise review of the fundamental features of the new ICRP recommendations, the biological criteria, and the developed conceptual framework of 'individual dose, and risk limits' to replace the previous concept of system of dose limitation in the ALARA triad. Speculative proposals

of amendments to the egyptian regulatory authorities based on the new ICRP publication 60 recommendations are discussed. 8 tabs.

Highly monoenergetic photon beams in the energy range 5 to 10 MeV obtained from thermal neutron capture on metallic elements such as iron, chromium, nickel, manganese, and copper are used for generating monoenergetic fast neutrons from the (γ,n) reactions on various elements. The later are resonance reactions based on a chance overlap between a γ line of the photon source and a nuclear level in the target. Both the incident γ lines and the nuclear levels are Doppler broadened where the broadening is caused by thermal motion and by the strong binding forces of the metallic state and is of the order of 10 eV for energies of around 8 MeV. 9803 (CONF-941041–2) **Status of stable enrichment and services at the Oak Ridge National Laboratory.** Aaron, W.S.; Tracy, J.G. Oak Ridge National Lab., TN (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 17. biennial world conference of the International Nuclear Target Development Society: targets, research materials and related topics of hadron physics; Bloomington, IN (United States); 17-21 Oct 1994. Order Number DE95007005. Source: OSTI; NTIS; INIS; GPO Dep.

Enriched stable and radioactive isotopes have played a significant role in the progress of mankind with most of that progress occurring in the last 50 years. The Oak Ridge National Laboratory (ORNL) has been a major contributor to that progress by developing production methods and supplying enriched isotopes to research, medical and commercial users world-wide. The only alternate major source for these materials, especially the stable isotopes, is located in Russia. Over this time period, many changes in the content and form of this function have occurred in response to scientific, commercial, and political influences. Many of these changes have been positive, while some have had a negative impact on the supply and availability of enriched isotopes. What has not changed, however, is the importance of these special materials to virtually all aspects of life.

9804 (DESY–94-71(prepr.)) **Separation of actinide-made transurania by a gas-filled magnetic separator.** Ninov, V. (Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany)); Armbruster, P.; Hessberger, F.P.; Hofmann, S.; Muenzenberg, G.; Fujita, Y. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Nov 1994. 27p. Order Number DE95745902. Source: OSTI; NTIS (US Sales Only); INIS.

The performance of the gas-filled magnetic separator HECK at the UNI-LAC at GSI Darmstadt is described. The system consists of a 30 -dipole magnet and a quadrupole doublet of wide aperture. The separator is operated with helium at pressures between (0.1-1) hPa. It is used to investigate heavy ion induced fusion products in-flight. The recoils emerging from a thin target are separated with high efficiency of (10-50)%. The suppression factor of primary beam particles and transfer products is (10^{15}) and (10^{3}), respectively. In this application of a gas-filled separator to synthesize transuranium elements using ^{238}U-targets, isotopes of the elements fermium and nobelium were identified in irradiations with ^{16}O- and ^{20}Ne-beams. (orig.)

9805 (INIS-mf–14471, pp. 4-7) **Production of no-carrier added ^{73}Se and ^{75}Se via the ^{75}As(p,3n) and ^{75}As(p,n) reactions using Cu_3As alloy as a high current target material Thermochromatographic separation of radioselenium from irradiated Cu_3As-target.** Lavi, N. (Tel Aviv Univ. (Israel)); Blessing, G.; Qaim, M.; Stocklin, G. Israel Nuclear Society, Yavne (Israel); Israel Radiation Protection Association (Israel); Radiation Research Society of Israel (Israel); Israel Society of Medical Physics (Israel). Israel Nuclear Society, Yavne (Israel). Nov 1994. Sponsored by Technion Research and Development Foundation Ltd., Haifa (Israel);Israel Electricity Co., Tel Aviv (Israel);Israel Atomic Energy Commission, Tel Aviv (Israel);Ministry of Energy and Infrastructure, Jerusalem (Israel). (CONF-9411188–: 1994 joint meeting of the nuclear societies of Israel, Tel Aviv (Israel), 28-29 Nov 1994). In *Transactions of the nuclear societies of Israel Joint meeting 1994.* 234p. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

The feasibility of applying Cu_3As-alloy as a high-current material for the routine production of ^{13}Se ($T_{1/2}$ = 7.1 h) and ^{75}Se ($T_{1/2}$ = 120 d) via the ^{75}As(p,3n) and ^{75}As(p,n)-reactions was experimentally investigated. A two-step thermochromatographic method using O_2 as the purging gas was developed to separate radioselenium which was taken up in 6M HCl. The experimental thick target yields of ^{73}Se and ^{75}Se were found to be 166.5 MBq (4.5 mCi)/μAh and 444 kBq (12 μCi)/μAh, respectively, corresponding to about 50 and 60%, respectively, of the theoretical value, taking into account that the As concentration in the Cu_3As alloy is 28%. The product was a high radionuclidic purity and predominantly consisted of SeO_3^{-2} (selenite).

9806 **Process and apparatus for producing tritium.** Hart, M.M. 1992. Filed date 28 Oct 1992. U.S. Patent Application 7-967,477. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95006137. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of an apparatus and process for the production of tritium in the reaction $n + He^3 \rightarrow p + H^3$. Helium-3 is placed in a container and subjected to neutron radiation. The He^3 reacts with the neutrons to form tritium, which is separated by selective diffusion through a tritium-permeable, helium-impermeable atomic sieve. The container may be placed in or near a power reactor to be later withdrawn for batch operation, or may be connected to a source of helium-3 and a withdrawing tank for tritium for continuous operation.

9807 **Composition for catalyzing hydrogen isotope exchange.** Heung, L.K.; Wicks, G.G. 1992. Filed date 28 Oct 1992. U.S. Patent Application 7-967,653. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95006131. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of a stable, highly porous metal oxide hydroxide-based composition for hydrogen isotope exchange. The composition is made by a sol-gel process. The starting material is an organometal of the form $M(OR)_x$, where M is an oxide-forming, metal, R is an organic ligand of the form C_nH_{2n+1}, and n and x are integers. A homogeneous, aqueous solution of the starting material is prepared, the pH of the solution is adjusted, the solution is hydrolyzed, and a catalyst is added. The catalyst is a transition metal in powder form, a salt or an organo-metallic compound of a transition metal in solution form. Other additives such as foaming agents and stabilizers may also be added. The resulting sol solution is polymerized and dried. The final product is a composition containing a uniformly dispersed catalyst in an inert, stable and highly porous matrix with a large number of surface OH groups. When a tritium-containing stream contacts the matrix, the catalyst facilitates

the exchange of the protium atoms of the surface OH groups with the tritium atoms of the stream in a reversible reaction.

The fruit fly, Dacus zonatus (Saunders) is a major pest of fruits in Thailand. The problem of ethylene dibromide (EDB) fumigant ban for disinfestation of fruit flies in fresh fruits and injury to many fruits by cold storage have led to interest in the use of gamma irradiation for disinfecting export commodities. The purposes of this experiment are to determine the optimum dose of radiation for disinfestation of fruit fly, D. zonatus eggs and larvae in Hom Tong banana, Nang Klangwan mango and papaya. The results of this experiment are as follows: 1) The LD_{50} for 20-hour-old eggs in banana, mango and papaya at 3 days after irradiation were 0.17, 0.15 and 0.14 kGy respectively. The dose of 0.3 kGy caused 100% mortality of eggs and larvae hatching from eggs irradiated at 0.05 and 0.15 kGy were unable to pupae and emerge as adults respectively, 2) the LD_{50} for 1-2-day-old larvae in banana, mango and papaya at 3 days after irradiation were 0.64, 0.47 and 0.49 kGy respectively. The dose of 0.6 and 0.3 kGy were required to prevent pupation and emergence respectively, 3) the LD_{50} for 3-4-day-old larvae in banana, mango and papaya at 3 days after irradiation were 1.0, 1.0 and 0.77 kGy respectively. The dose of 1.2 and 0.3 kGy were required to prevent pupation and emergence respectively.

9810 (INIS-mf–14445, pp. 1-13, PAPER A-3) **Neutron scattering cross sections from 12C at 14 MeV using associated alpha particle time of flight technique.** Vilaithong, T. (Chiang Mai Univ., Faculty of Science, Physics Dept. (Thailand)); Pairsuwan, W.; Suwanakachorn, D.; Singkarat, S. Office of Atomic Energy for Peace, Bangkok (Thailand). 1988. 440p. (In Thai). In *Proceedings of the second nuclear science and technology conference no. 2.* Order Number DE95619740. Source: OSTI; NTIS (US Sales Only); INIS.

Neutron scattering cross sections were measured for ^{12}C at incident neutron energy of 14 MeV using an associated-alpha particle time-of-flight technique. Angular distribution for ^{12}C elastic scattering and inelastic scattering to the 4.43 MeV excited state were obtained between 15 and 150 deg in 5 deg increments. The data were corrected for neutron multiple scattering in the sample using a Monte Carlo simulation code. These results are compared to previous measurements and the recommended values.

Source: OSTI; NTIS (US Sales Only); INIS.

The n-p interaction in polyethylene is used to convert 14 MeV neutrons into lower energy neutron groups. By using a pulsed neutron generator and polyethylene scattering rings, neutron time-of-flight and pulse-height data are acquired together in a two-parameter data acquisition system. This method can be used for the testing of neutron detectors.

Dept. of Nuclear Technology). Office of Atomic Energy for Peace, Bangkok (Thailand). 1988. 440p. (In Thai). (CONF-8804346–: 2. Nuclear science and technology conference, Bangkok (Thailand), 19-22 Apr 1988). In *Proceedings of the second nuclear science and technology conference no. 2.* Order Number DE95619740. Source: OSTI; NTIS (US Sales Only); INIS.

This paper is the summary of experiences in research and development initiated at Chulalongkorn University, during the past 3 years, in the field of nuclear science and technology. The project began with only a handful of people and very limited resources. The project consists of pre planned research programs with a common goal: to be a research and development unit using nuclear techniques for industrial applications.

9813 (INIS-mf–14445, pp. E-6, 1-21) **Effectiveness of construction materials and some minerals used as radiation shielding.** Khunarak, P.; Bunnak, S. Office of Atomic Energy for Peace, Bangkok (Thailand). 1988. 440p. (In Thai). (CONF-8804346–: 2. Nuclear science and technology conference, Bangkok (Thailand), 19-22 Apr 1988). There are many kinds of ores in Thailand, some large amount of them are cheap and easy to obtain possess shielding properties for gamma radiation. These ores are baryte, ilmenite, galena, scheelite, wolframite pyrite, cerrusite. Besides, building structure materials are also introduced for shielding properties study by using Co-60, Cs-137 and Ra-226 as gamma radiation sources in the experiments. The results turn out that those high density ores will possess a better shielding property than the low density ores. Radiation measurement equipment is G.M. tube connected to rate meter.

Organization rules of production process at the sterilization facility have been described. Proper manners for packing and storage of the sterilized products have been also presented. Dose requirements for different kinds of sterilized materials as well as methods of their control have been shown and discussed.

9817 (INIS-mf–14460) **The assessment of the basic movement parameters for marine sediments by means of radiotracer investigations.** Pruszak, Z. (Polska Akademia Nauk, Gdansk (Poland). Inst. Budownictwa Wodnego); Wierzchnicki, R. No corporate text available. 1994. 9p. (In Polish). (CONF-9409288–: Marine hydro-engineering and environment, Gdansk (Poland), 15-16 Sep 1994). Order Number DE95618624. Source: OSTI; NTIS (US Sales Only); INIS.

Interest and practical engineering activity is most often focused on the region of the coastal zone stretching from the shoreline to a depth of the order of several metres. Sediment transport in this region was the object of intensive and complex field studies with the use of radioisotopic tracers. Taking into account the natural features of the sand, glass beads with a diameter of D=0.02-0.025 cm and mass density of 2668 kg/m^3 were prepared. The beads were labelled with Ir-192, with a half time of 74,4 days. The results of analyses lead to the conclusion that the bead load transport most often occurs in a relatively thin layer, exceeding 2 cm only in storm conditions. In the case of weak wave motion this layer has a thickness of several grain diameters, while it may be even 4-6 cm thick in storm conditions. It has been found that for an oblique direction of wave to the shoreline, the local intensity of sediment transport can attain a rate of 40-100 kg/m·hour. The global sediment transport rate has been summed up for the entire surf zone, yielding 7 m^3/s and much more in storm conditions. (author). 2 refs, 5 figs.

9818 (INIS-mf–14461) **Radiotracer method for investigations of marine sediment movement.** Wierzchnicki, R. (Institute of Nuclear Chemistry and Technology, Warsaw (Poland)). Source: OSTI; NTIS (US Sales Only); INIS.

The subject of the paper is presentation of the general principles of study of marine bed load transport using the radioactive tracer technique. Experimental field work has been concluded on the Polish coast (Baltic Sea) since 1983. Artificial sand including radioactive Ir-192 was used as a tracer. Injection and detection methods are described in this paper. Analyses of results were performed using balance of count rate. The parameters obtained i.e. velocity and layer thickness were used to estimate the bed load transport rate. (author). 5 refs, 3 figs.

Many situations occur in radiotherapy where irradiation of irregularly shaped electron fields or fields not in the central axis is required, as for example in head and neck tumors, apex of file lung in certain breast treatments and several types of superficial tumors. The clinical dosimetry of these small and irregular electron beams remains a difficult problem despite several empirical and analytical models developed in recent years. The present work is the first part of an extensive research that try to give a complete solution to the problem of output factor calculation for the above mentioned fields . A practical method based on the calculation of an equivalent square field, in terms of range parameters derived from the PDD curve, for output factor calculation of small and irregular fields is proposed. In order to shorten the dosimetry procedure, film dosimetry was used. (authors). 5 refs.

9821 (NEI-DK–1762) **In-situ calibration of large heat meters in district heating plants by means of radioisotope flow measuring methods.** Moerch, E. (FORCE Instituttet, Broendby (Denmark)); Thrane, M. FORCE Insts., Copenhagen (Denmark). Sep 1994. [57p.] (In Danish). Contract ENS-1323/90-0015. Order Number DE95620278. Source: OSTI; NTIS; INIS.

EFP-90.

The growing use of district heating network requires a reliable system of calibrated heat meters. Radioactive tracer techniques enable such control and calibration. The standardized methods of liquid flow measuring by means of radioisotope injection are described in ISO Standards 2975/VII and 555/3. The measurement consists in isotope dilution determination in hot water samples, rather than in determination of the flow rate which requires a long distance between the injection and testing point on the heat distribution pipeline. The development project aims at modification and construction of specialized equipment for radioisotopic calibration measurements of large heat meters according to the flow-rate method and dilution method. Testing of the method efficiency is based on comparison with reference measurements of the Danish Technological Institute. Instrumentation is described in detail in the Appendix. All the stages from tracer dosing for injections to the determination of the tracer in the final extracted sample are automatically controlled by a PC software, not included in this report. (EG).

9822 (ORNL/TM–12505) **Conceptual design of a high-intensity positron source for the Advanced Neutron Source.**

Hulett, L.D.; Eberle, C.C. Oak Ridge National Lab., TN (United States). Dec 1994. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95006359. Source: OSTI; INIS; NTIS; GPO Dep.

The Advanced Neutron Source (ANS) is a planned new basic and applied research facility based on a powerful steady-state research reactor that provides neutrons for measurements and experiments in the fields of materials science and engineering, biology, chemistry, materials analysis, and nuclear science. The useful neutron flux will be at least five times more than is available in the world's best existing reactor facility. Construction of the ANS provides a unique opportunity to build a positron spectroscopy facility (PSF) with very-high-intensity beams based on the radioactive decay of a positron-generating isotope. The estimated maximum beam current is 1000 to 5000 times higher than that available at the world's best existing positron research facility. Such an improvement in beam capability, coupled with complementary detectors, will reduce experiment durations from months to less than one hour while simultaneously improving output resolution. This facility will remove the existing barriers to the routine use of positron-based analytical techniques and will be a giant step toward realization of the full potential of the application of positron spectroscopy to materials science. The ANS PSF is based on a batch cycle process using ^{64}Cu isotope as the positron emitter and represents the status of the design at the end of last year. Recent work not included in this report, has led to a proposal for placing the laboratory space for the positron experiments outside the ANS containment; however, the design of the positron source is not changed by that relocation. Hydraulic and pneumatic flight tubes transport the source material between the reactor and the positron source where the beam is generated and conditioned. The beam is then transported through a beam pipe to one of several available detectors. The design presented here includes all systems necessary to support the positron source, but the beam pipe and detectors have not been addressed yet.

9823 (PSI–95-02) **The PSI radon chamber model.** Butterweck, G. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Schuler, C. Paul Scherrer Inst. (PSI), Villigen (Switzerland). Feb 1995. 59p. Order Number DE95621480. Source: OSTI; NTIS; INIS.

For a better understanding of the behaviour of radon and its progeny in the PSI radon chamber, a numerical model has been developed. Existing models have been extended to take into account different diffusion constants of the ultrafine clusters of the unattached radon progeny. The influence of air filtering for measurements is also included. The resulting differential equations have been solved in detail. For the chamber operation, three modes have been checked numerically, the first using a continuous flow through radon source and radon chamber into the exhaust system. The second mode consists of pumping an amount of radon into the chamber, which is then sealed, and the third mode uses a continuous radon measurement and a controlling device which activates source or exhaust flows. The dependence of the radon progeny on air filtering for measurements was studied in comparison to undisturbed conditions. Compared to an atmosphere without sampling, 4% deviation of the total radon progeny activity concentration has to be taken into account, if in a 11 m^3 radon chamber air is filtered during 10 minutes with a flowrate of 40 l min^{-1}. The influence of deviations of the attachment rate of the unattached fraction between the radon decay products has been studied. The unattached fraction f_p decreases to half its value, if the diffusion constant of the primary radon daughter ^{218}Po increases by a factor of 2.5 compared to the diffusion of the other radon progeny ^{214}Pb and ^{214}Bi. 9826 (ENEA-RT-ENERG–92-05) **Advanced electrolysers supplied by photovoltaic power systems.** Ciancia, A. (ENEA, Casaccia (Italy). Area Energetica). ENEA, Casaccia (Italy). Area Energetica. Sep 1993. 39p. (In Italian). (RT/ENERG–92-05). Order Number DE95749709. Source: OSTI; NTIS (US Sales Only).

In this report the variables of the efficiency are analyzed togheter with the main characteristics of conventional and advanced electrolysers. To provide specifications for hydrogen purification equipment, the gas purity required by several storage and utilization systems are reviewed with respect to the quality provided by the electrolytic technology. Finally, the specifications of advanced electrolysers suitable for photovoltaic operation are derived with reference to the characteristics of solar source and photovoltaic hydrogen system.

9827 (NREL/TP–430-7752) **Hydrogen program summary Fiscal Year 1994.** National Renewable Energy Lab., Golden, CO (United States). Mar 1995. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004033. Source: OSTI; NTIS; GPO Dep.

The annual program summary provides stakeholders within the hydrogen community with a snapshop of important advances that have occurred in the National Hydrogen Program over the fiscal year, including industry interactions and cooperation. The document will also be used to encourage additional potential industrial partners to join the Hydrogen Program Team. Fiscal Year 1994 marked a turning point for the Hydrogen Program, with a budget that grew significantly. The focus of the program was broadened to include development of hydrogen production technologies using

municipal solid waste and biomass, in addition to an increased emphasis on industrial involvement and near-term demonstration projects. In order to maintain its near- and long-term balance, the Hydrogen Program will continue with basic, fundamental research that provides the long-term, high-risk, high-payoff investment in hydrogen as an energy carrier.

9828 **Hydrogen absorption/desorption method and apparatus.** Heung, L.K. 1992. Filed date 28 Oct 1992. U.S. Patent Application 7-967,491. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95006134. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of an apparatus and method for recovering hydrogen and separating its isotopes. The apparatus includes a housing bearing at least a fluid inlet and a fluid outlet. A baffle is disposed within the housing, attached thereto by a bracket. A hollow conduit is coiled about the baffle, in-spaced relation to the baffle and the housing. The coiled conduit is at least partially filled with a hydride. The hydride can be heated to a high temperature and cooled to a low temperature quickly by circulating a heat transfer fluid in the housing. The spacing between the baffle and the housing maximizes the heat exchange rate between the fluid in the housing and the hydride in the conduit. The apparatus can be used to recover hydrogen isotopes (protium, deuterium and tritium) from gaseous mixtures, or to separate hydrogen isotopes from each other.

9830 (NEI-DK–1868) **Resources of wastes for combustion 1993 and 2000.** Ramboell, Hannemann og Hoejlund A/S, Copenhagen (Denmark). Nov 1994. 133p. (in Danish). Order Number DE95755103. Source: OSTI; NTIS.

The report illustrates which type, and what amounts, of waste from Danish waste incineration plants can be expected to be available as fuel for the country's district heating and cogeneration plants during the year 2000. Of the wastes produced during 1993, 23% originated from primary sources, 29% of this was incinerated at municipal-waste combustion plants and 47% was re-used. The policy of the Danish government in this respect is that 16% of wastes from primary sources should be deposited, 31% should be incinerated and 53% re-used, based on the assumption that the same amount of waste is produced in 2000 as in 1993. It is shown that the rules against dumping of burnable rubbish should reduce dumping needs by 505 tons annually so that wastes from primary sources that need to be dumped will be ca. 1 million tons. The consequences of the initiatives taken under the government plan for the management and re-use of wastes would be that 30% of total waste production will be from primary sources, answering to 2,099 thousand tons annually which could be used as fuel in district heating and cogeneration plants at municipal waste combustion plants. The intent of this pamphlet is to share information with others who are interested in useful protocols for cotton cytogenetics and cytology. The protocols described are a beginning effort and they are expected to be improved. All methods, results and data given pertain to cultivar MD 51ne. We are not satisfied with our results of in situ hybridization.

9833 (DOE/PC/93204–T3) **Systems and economic analysis of microalgae ponds for conversion of CO_2 to biomass. Fourth quarterly technical progress report, June 16, 1994–September 15, 1994.** Benemann, J.R.; Oswald, W.J. California Univ., Berkeley, CA (United States). Dept. of Civil Engineering. 28 Dec 1994. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93204. Order Number DE95007655. Source: OSTI; NTIS; GPO Dep.

The threat of global warming, mounting concerns about air and water pollution, prospective food shortages, and declining reserves of low-cost fossil fuels, have spawned a burgeoning interest in photobiological processes using microalgae as a method of large-scale utilization of CO_2 for the production of fuels, food, and waste treatment. The major activity during this quarter was the development of cost data for the algal production system, including alternatives to the basic design previously used. The results of this work are still being developed and will be reported in the Final Report. This progress report summarizes a study of a production processes for one specific alga, Botryococcus braunii. This alga is of particular interest in this project as it produces an almost pure hydrocarbon fuel, and does so in rather large amounts. Technology for the production of this organism has, however, not yet been developed. This progress report reviews the literature on this interesting alga and suggests potential methods for its production. 62 refs.

9834 (DOE/PC/93212–T5) **Biological determinants of photobioreactor design. 6th Quarterly report, October 1994–December 1994.** Palsson, B.O.; Brown, G.G. Michigan Univ., Ann Arbor, MI (United States). Dept. of Chemical Engineering. [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93212. Order Number DE95007997. Source: OSTI; NTIS; GPO Dep.

A novel photobioreactor (PBR) system using light-emitting diodes (LEDs) as a sole light source was constructed and operated with continuous medium perfusion. Direct internal illumination by 680 nm LEDs could deliver as high as 50 mW/cm^2 of light into the culture medium. Gas transfer by internal sparging had the capacity to

transfer 250 mmol O_2/L culture/h. Nutritional limitations could be overcome by continuous perfusion, supplying the medium components to the culture without increasing osmolarity, while removing potentially inhibitory cellular wastes. When the PBR operated in a continuous perfusion mode with a perfusion rate of 6 reactor volumes a day (6 VVD), it could support ultra high-density algal cultures up to cell concentrations of $4 \cdot 10^9$ cells/mL and total cell volume fractions of 9.4% v/v (about 25 g dry weight/L). The oxygen production rate at its peak was 13 to 15 mmol/L culture/h. This performance represents the highest reported cell densities attained in photoautotrophic cultures. Continuous perfusion allowed for long-term stable oxygen production, while oxygen production in batch mode ceased when stationary phase was reached. The results presented suggest that PBR technology can still be significantly improved.

0909 Processing

9835 (DOE/CE/15594–T3) **A low energy continuous reactor separator for the production of ethanol from corn grits/starch and biomass streams. 3rd Quarterly report, October 15, 1994–January 15, 1995.** Bio-Process Innovation, Inc., West Lafayette, IN (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-94CE15594. Order Number DE95006409. Source: OSTI; NTIS; GPO Dep.

This project is an attempt to develop and demonstrate an improved reactor for the production of ethanol from starch and ligno-cellulosic streams. Bio-Process Innovations holds a patent of this reactor technology, and is directing the project. A Continuous Stirred Reactor Separator (CSRS) is being built on a pilot plant scale for testing at a small Iowa ethanol plant (Permeate Refining) while bench scale tests on the reactor system are being performed at Purdue University. The project involves two industrial partners, Permeate Refining of Hopkinton, IA who will site and operate the pilot scale unit, and Lamont Sign Co, who are building the pilot scale unit. The CSRS is expected to allow the continuous conversion of various substrates to ethanol. The CSRS unit combines several operations within the confines of the reactor vessel; (1) complex carbohydrates are reduced to simple sugars by enzymatic breakdown; (2) sugars are converted to ethanol by yeast or bacteria; and (3) the ethanol is separated by a stripping gas stream. The ethanol is removed from the stripping gas in an absorber, and then taken to an extractive distillation column. This unit should allow concentrated feeds to be converted to ethanol, and the use of bottoms recycle will be extensively tested to establish the limits of minimizing net bottoms water production leaving the plant. Progress during this quarter is described.

9836 (DOE/CE/40905–57-Draft) **Development of a prototype lignin concentration sensor. Final report. Draft.** Jeffers, L.A. Babcock and Wilcox Co., Alliance, OH (United States). Research and Development Div. Nov 1994. 200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC05-90CE40905. Order Number DE95003344. Source: OSTI; NTIS; GPO Dep.

The ultimate objective of the DOE-sponsored program discussed in this report is to commercialize an instrument for real-time, in-situ measurement of lignin in wood pulp at a variety of locations in the pulp process stream. The instrument will be used as a primary sensor for process control in the pulp and paper industry. Work done by B&W prior to the initiation of this program had shown: there is a functional relationship between the fluorescence intensity and the Kappa number as measured at the pulp mill laboratory. Kappa number is a standard wet chemical method for determination of the lignin concentration; the relationship is one of decreasing intensity with Kappa number, indicating operation in the quenched fluorescence regime; a great deal of scatter in the data. Because of the preliminary nature of the study, the origin of the scatter was not identified. This report documents the results of laboratory measurements made on a variety of well defined pulp samples to generate the data necessary to: determine the feasibility of an instrument for on-line lignin concentration measurement using laser fluorescence; identify the preferred measurement strategy; define the range of applicability of the instrument; and to provide background information to guide the design of a field-worthy prototype.

9837 (NEI-DK–1818) **Account of the potentials for increasing the the production of biogas from animal manures.** Danmarks Tekniske Hoejskole, Lyngby (Denmark). Inst. for Bioteknologi. Oct 1993. 188p. (In Danish). Contract ENS-1383/93-0001. Order Number DE95744847. Source: OSTI; NTIS.

EFP-93.

The aim was to discover how to treat the fibre fraction of animal manure slurries in biomass conversion plants so as to optimize the production of methane. Various methods are described in detail. Anaerobic hydrolytic microorganisms will break down cellulose and hemicellulose to a certain extent if not associated with lignin. In order to increase the microbial hydrolysis of lignocellulose, it is necessary to separate chemical components and/or change the physical composition during the preliminary treatment of the biomass. The ideal method reduces the content of lignin and the crystallinity and increases the surface area. It has been reckoned that if 100% of added volatile solids could be converted totally, theoretically the maximum annual production of methane would be between 500.000-1000.000 cubic meters, dependent on the size of the plant. But other factors would reduce this amount considerably. (AB) (75 refs.)

9838 (NEI-DK–1866) **Development of a degasification tank.** Linkogas AmbA, Lintrup (Denmark). 1994. 8p. (In Danish). Contract ENS-51161-93.0003. Order Number DE95755105. Source: OSTI; NTIS.

In relation to a biomass conversion plant producing methane, a storage tank for manure slurries from which the gas which is usually let free (to the irritation of neighbours because of its odor) can be produced, and which will also provide extra storage capacity, has been designed and produced by a Danish firm. It is covered in order to reduce odor. The firm plans to develop a new type of 'stirrer', centrally placed and divided into three sections (pipes) at the base. This 'propeller' drives the stream of manure slurry to the base of the tank where it is lead into the three pipes and along the base and then out towards the sides of the tank. After this the stream will be forced up the sides of the tank and up towards the surface. Then it will be sucked down into the center and down into the central tube again. In this way surface scum will be avoided. It is suggested that the tank itself should be constructed of bolted steel plates. This type of tank with stirrer is described in detail. It was found that the use of the tank will lead to methane recovery to the extent of 2.4%, which is less than had been expected. The stirring effect was not quite satisfactory and is not suitable for manures with a large particle content. A new type of stirrer will be tested. (AB)

9839 (SEI-EED–39) **Assessment of earth kiln charcoal production technology.** Hibajene, S.H. (Ministry of Energy and Water Development, Department of Energy (Zambia)). Stockholm Environment Inst. (Sweden). 1994. 48p. Order Number DE95744969. Source: OSTI; NTIS.

The primary objective of the study was to determine the most important factors for increasing or maximizing the output of the earth clamp method of charcoal production and their effects on charcoal quality. A secondary aim was to propose measures that would be needed in order to enable charcoal producers to adopt high yielding practices. Altogether, six factors were investigated namely, wood arrangement in a kiln, direction of carbonization in relation to prevailing wind direction, moisture content, insulation thickness, weight distribution (distribution of log sizes in a kiln) and size of kiln. None of the factors investigated influenced the yield by more than 25%. The cross-wise method of wood arrangement gave a slightly higher yield than length-wise loading, but yielded charcoal of a higher quality. Firing the kiln along the prevailing wind direction gave better output than firing against the wind. The moisture content of the wood was observed to have only a small effect on the yield and quality of charcoal. In the case of weight distribution, the use of smaller logs gave a better yield of charcoal than large logs. These results shows that wood that is currently discarded because it is considered too small for charcoal production can actually be used at good advantage. The charcoal from kilns in which small logs dominated yielded charcoal with less

volatile matter than from the kilns where large logs were dominant. Hence both in terms of production and end-use the small logs have an advantage over the large logs. 7 refs, 5 figs, 3 tabs

9840 (VF-BIO–94-12) **VEGA test and verification - Pressurized gasification of biomass.** Liinanki, L.; Karlsson, Gerth. Vattenfall Utveckling AB, Vaellingby (Sweden). Nov 1994. 101p. (In Swedish). Project Bioenergy-38590. Order Number DE95744960. Source: OSTI; NTIS.

Based on pre studies of different power generation technologies the IGCC (Integrated Gasification Combined Cycle) based on air blown gasification with hot gas clean-up and combined cycle was found to be one of the most promising technologies for power production from biofuels. The IGCC for biofuels is a new technology with several unproven process steps. To verify the performance of the critical process steps an extensive testing programme has been carried out covering all aspects of a biomass fuel based IGCC. This report deals with the accomplishment and the results from this testing programme. The most extensive programme has been carried out concerning gasification and gas clean-up. The gasification testing programme included an extensive sampling and analysis programme for heavy metals and organic compounds in ash and product gas. The result from the tests show that the concept work well with expected performance. The ceramic high temperature filter has worked well for dust- and alkaline cleaning of the product gas. Most of the fuel bound nitrogen (60-80%) is converted to ammonia at gasification. A part of the produced ammonia (25-50%) is converted to nitrogen oxides at combustion in the gas turbine. Even if this conversion rate was less than expected it is estimated that there is a need of further NO_x reduction (SCR) after the gas turbine. The heavy metal content in bottom- and fly ash is very low. 11 refs, 24 figs, 18 tabs

0910 Properties and Composition

9841 (NREL/TP–430-7449) **Assessment of landfill reclamation and the effects of age on the combustion of recovered municipal solid waste.** Forster, G.A. (Lancaster Environmental Foundation, PA (United States)). National Renewable Energy Lab., Golden, CO (United States). Jan 1995. 128p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004002. Source: OSTI; NTIS; GPO Dep.

This report summarized the Lancaster county Solid Waste Management Authorities's (LCSWMA)landfill reclamation activities, ongoing since 1991. All aspects have been analyzed from the manpower and equipment requirements at the landfill to the operational impacts felt at the LCSWMA Resource Recovery Facility (RRF) where the material is delivered for processing. Characteristics of the reclaimed refuse and soil recovered from trommeling operations are discussed as are results of air monitoring performed at the landfill excavation site and the RRF. The report also discusses the energy value of the reclaimed material and compares this value with those obtained for significantly older reclaimed waste streams. The effects of waste age on the air emissions and ash residue quality at the RRF are also provided. The report concludes by summarizing the project benefits and provides recommendations for other landfill reclamation operations and areas requiring further research.

9842 (JTI–195) **Combustion of rapeseed oil.** Noren, O. Swedish Inst. of Agricultural Engineering, Uppsala (Sweden). 1994. 16p. (In Swedish). Order Number DE95744989. Source: OSTI; NTIS.

Rape seed oil have been used as heating oil on a couple of farms in Sweden during the last years. It has been shown that the rapeseed oil dissolves impurities in tanks and pipes, which leads to clogging in pumps if no pre-filters are used. Filters of 40μ or finer should be used. It is also very important that the oil is of high purity before it is filled to the tanks. It has also been shown that the rape seed oil is very aggressive towards sealings of certain materials. The sealings should be made of viton or similar material. 4 refs, 5 figs, 3 tabs

9843 (SEI-EED–38) **Efficiency and emissions of charcoal use in the improved Mbaula cookstove.** Kaoma, J. (Building and Industrial Minerals Research Unit, National Council for Scientific Research, (Zambia)); Kasali, G.B.; Ellegaard, A. Stockholm Environment Inst. (Sweden). 1994. 30p. Order Number DE95744968. Source: OSTI; NTIS; INIS.

An improved chamber method was used to evaluate the thermal performance and emission characteristics of charcoal in an unvented cookstove known as the Improved Mbaula. Emission factors and rates for pollutants, burn rate and stove efficiency were determined. The pollutants that were continuously monitored were carbon monoxide (CO), sulphur dioxide (SO_2), nitric oxide (NO), nitrogen dioxide (NO_2), and respirable suspended particulates (RSP). Concentrations of CO, nitrogen oxides and RSP in the test chamber (a simulated kitchen) reached levels in excess of guidelines recommended in industrialized countries. Concentrations of SO_2 did not exceed known levels. If the test chamber actually is a good simulation of a common kitchen, the levels reached warrant concern for the health of people exposed, mostly women and children. Levels of pollution in actual kitchens will be assessed in a later study. The adjustable opening of the stove proved effective in regulating the burn rate. At half air input, burn rate decreased by about 40%, while emissions increased by about 60% compared to operation at full air input. Emissions of CO were 340 g/kg charcoal at full air input, which was taken to be the normal mode of operation. The average thermal efficiency (PHU) of the improved mbaula was 25% compared to 29% for the traditional charcoal stove. 16 refs, 4 figs, 12 tabs

9844 (SLU-LBT-SPM–197) **Combustion of reed canary grass and grains in small furnaces.** Praks, O. Swedish Univ. of Agricultural Sciences, Lund (Sweden). Dept. of Farm Buildings. 1993. 91p. (In Swedish). Order Number DE95744955. Source: OSTI; NTIS.

Figures and tables with text in English.

In order to evaluate a heating furnace for chopped straw concerning flue gas emissions and the function of the feeding equipment, firing tests with different types of straw have been carried out. The following fuels were used: Wheat straw of winter wheat: Barley straw of spring barley: Reed canary grass, summer harvested. The heating system consisted of the following components: Straw chopper for small bales with a number of revolutions of 2800 rpm: Straw silo with a diameter of 2.34 m and a volume of appr. 6 m^3: Solid fuel furnace stoker fed with a nominal effect of 200 kW. The straw chopper produced a material with a straw length distribution almost identical for all three fuels. About 70% of the chopped material was shorter than 25 mm and only about 5% of the straws were longer than 50 mm. The chopped reed canary grass contained much more grinded material than the other two fuels. The water content was 13.2, 12.3 and 16.4% respectively for wheat straw, barley straw and reed canary grass. The heating tests with wheat straw resulted in the lowest carbon monoxide emissions with mean values during three hours varying between 729 and 2047 mg/m^3n at 8% O_2. The values from reed canary grass tests were somewhat higher, between 1993 and 3440 mg/m^3n, while heating with chopped barley straw resulted in the highest values, between 2257 and 5837 mg/m^3n. At all tests the limit 500 mg CO/m^3 was exceeded. During the measuring period emission values of carbon monoxide showed great variations. The emissions of NO_x were rather low and in most cases below the limit value of 350 mg/m^3n. Dust emissions from the test firings with barley showed values between 850 and 1757 mg/m^3n. For reed canary grass the dust emission varied between 474 and 1265 mg/m^3n. The study shows that firing with barley straw results in bigger emission than when using wheat straw, independent if the straw is chopped or grated. 10 refs, 47 figs, 8 tabs

Figures and tables with text in English.

To determine fuel data for reed canary grass pellets and grains and to investigate their suitability as fuel in smaller furnaces, firing tests have been carried out. The total amount of fuel used was approximately 30 tons. Reed canary grass pellets with a diameter of 8 mm were examined. The water content of the pellets harvested during autumn was rather high (approximately 10%). The material harvested during spring has a water content of approximately 5% and was considered very good quality. The calorimetric heat value for reed canary grass pellets was 18.7 MJ/kg DM (5.2 kWh/kg DM). The values were the same for autumn and spring harvest. However, the difference in water content gave a higher heat values of approximately 4% for the spring harvest (16.3 compared to 15.6 MJ/kg tot). Mixing with wood increased the heat value in relation to the proportion of wood. The ash content was somewhat higher for the material harvested during spring (5.4%) compared to autumn (4.7%). The melting point of the ash increased from 1010 degrees C to 1370 degrees C between autumn and spring harvest. Emission of carbon dioxide, CO, given as mean values during periods of three hours, showed great variations. The autumn harvest gave the highest emission values, in some cases very high, about 8000 mg/m^3n. Also the values for the spring harvest were very high. The emissions of NO_x were relatively small and had a rather even level. Firing tests with grain used winter-wheat and early spring barley. Both kinds of grain were well rinsed and dry with 11.3 and 12.4% water content respectively. The calorimetric and effective heat values were on the same level as for reed canary grass and straw. The ash content was rather low, 2.1-2.5% of DM. The sulphur content was 0.13 and 0.14% respectively. The ash temperature at the beginning of the melting showed a big difference between wheat and barley.

9846 (SLU-LBT-SPM–203) **Straw furnaces on farm level.** Praks, O. Swedish Univ. of Agricultural Sciences, Lund (Sweden). Dept. of Farm Buildings. 1993. 76p. (In Swedish). Order Number DE95744956. Source: OSTI; NTIS.

For straw burning furnaces on farm level, the number of makes on the Swedish market is very limited. On this market there are today five well established products, all of them Danish. Three of these represent furnaces for burning of whole bales, while two of them are designed for continuous burning of chopped straw. The market size during the last five years can be estimated to 10 to 15 installed heating equipment per year. Most of these are whole bale furnaces and only a few are designed for continuous burning. An investigation of some Danish tests shows that many tests have been carried out on furnaces which are today old-fashioned, and that the types of today, especially whole bale furnaces, are of much better characteristics. However, there are tests showing that the whole bale furnaces still can be improved considerably. For todays furnaces the tests show that the different makes of whole bale furnaces do not differ much concerning boiler efficiency and smoke gas emissions. Comparing such a furnace with a continuous burning one, the emission of carbon monoxide is higher but the dust emission is lower. A smaller emission test carried out by LBT shows that same result as other available tests, but indicates also that modern furnace equipment for continuous burning can have considerably better results than the tests of old-fashioned equipment have shown. Experiences from both testing and users of straw burning equipment s say that the quality of straw is very important for the burning results. A test result showed a difference in boiler efficiency of 10 per cent units between firing with good wheat straw and poorly aired barley straw. Working experiences show that the equipment on farms today have now been developed to good and reliable constructions. 12 refs, 26 figs, 15 tabs

9848 (JTI–194) **Logistics for simultaneous harvesting and cutting of short rotation energy forest.** Danfors, B.; Norden, B. Swedish Inst. of Agricultural Engineering, Uppsala (Sweden). 1994. 57p. (In Swedish). Order Number DE95744988. Source: OSTI; NTIS.

With 7 pages summary and discussion in English. Figures and tables with text in English.

Performance studies have been used as a basis for economic calculations prepared for harvesting of energy forests. Emphasis in the work during the winter was placed on developing and using a computer-based analytical programme for compiling calculations for logistics in harvesting and delivery of Salix. The strategy was to initially work with directly harvested material in order to subsequently include all handling in whole-shoot harvesting. The aim of the study was to describe how logistics in direct harvesting of Salix can be developed under prevailing conditions. Using the prepared analytical programme, calculations have been compiled for different handling and transportation systems from harvesting to delivery at a district heating plant. A description is also given in the report of the analytical programme and examples are given of how it is used. The intention is that it should be supplemented in pace with the emergence of new data and experiences. The analytical programme can then be available to, e.g., Salix advisers and other people working within this sector.

Project Skogskraft, report nr 22.

This report describes the consequences of increased use of forest fuel for, primarily, red-listed (i.e. disappeared, threatened, vulnerable, rare or care demanding) invertebrates in Sweden. The report concentrates in invertebrate animals that largely live in parts of trees, trees or in tree biotopes that today are not utilised in conventional forestry but which to varying extents may be affected by increased removal of forest fuel. Certain environments should not in any way be utilised for removal of fuel, whereas others can be used provided that relevant consideration is taken to nature. Felling residues such as processor piles are of little value for red-listed species. Lying or standing trees left in the felling areas are of great importance for invertebrates in the category 'care demanding' and should not be removed. Return of stabilised slowly available ashes have so far had little effect on the soil fauna studied, but there are no data on long-term effects. Fire-damaged trees are very valuable and should be saved. In the event of felling large burnt over areas,

a selection of fire-damaged trees and groups of trees should be left. Forest edges, certain rocky outcrops in arable fields, and wooded meadows are frequently very species-rich environments and should usually not be used. In environments where overgrowing is a problem removal of fuel in the form of a careful thinning is positive for the invertebrate fauna. Old deciduous trees, both in the forest and in the cultivated countryside are valuable environments for many species and should be saved. If the interest in biofuels leads to deciduous trees being given extra space this will be positive for the fauna, provided that a continuity of old and dead deciduous trees is assured. Requirements for consideration to nature differ slightly in different parts of Sweden. 12 refs, 3 figs, 3 tabs

During the seventh quarter the authors completed experiments to optimize process conditions for the gas-phase quenched pyrolysis reaction. Most of the work in this quarter dealt with a study of the effect of methane partial pressure, i.e. dilution, on the reaction along with preliminary work in acquiring catalysts to be used in a latter phase of this project. Experiments were performed at temperatures between 1000 and 1200°C, methane flows of 185-1800 Scc/min, methane partial pressures of ca. 0.2 to 1 bar (using helium as a diluent), and a constant quench water flow of 250 mL/hour. All experiments showed a decrease in methane conversion and an increase in C_2 - C_{10} selectivity with increased dilution. The overall effect of the dilution, however, was to reduce the yield of useful products. A number of catalysts have been selected and procured for future work in evaluating catalytic pyrolysis. The catalysts were selected on the basis of having significant surface area and structural stability at the temperatures of interest. Several Ba and Mn-substituted hexaaluminates were prepared by coprecipitation from the nitrate salts at a constant pH. Surface areas up to 22 m^2/g were obtained after calcination to 1200°C.

Fullerenes are a recently discovered allotrope of carbon that have been found to possess unusual properties, some of which may be ideal for methane activation. This project is designed to evaluate these carbon based materials for conversion of methane into higher hydrocarbons. The project is divided into three technical tasks. Task 1 deals with the synthesis and characterization of the fullerenes and fullerene soots, Task 2 with the testing of the catalysts, and Task 3 with the evaluation of the results and technical reporting requirements. The results and accomplishments for this quarter are summarized below. In addition, the authors recently presented work on the use of fullerene based catalysts for methane activation at the American Chemical Society in Washington, DC this Fall. The paper is found in Appendix A of this report.

9853 (DOE/PC/92114–T5) **Gasoline from natural gas by sulfur processing. Quarterly report No. 5 for the period July 1994–September 1994.** Erekson, E.J.; Miao, F.Q. Institute of Gas Technology, Des Plaines, IL (United States). Oct 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93PC92114. Order Number DE95005561. Source: OSTI; NTIS; GPO Dep.

Natural gas is an abundant resource in various parts of the world. The major component of natural gas is methane, often comprising over 90% of the hydrocarbon fraction of the gas. The expanded use of natural gas as fuel is often hampered because of difficulties in storing and handling a gaseous fuel. This is especially true for natural gas in remote areas such as the North Slope of Alaska. The successful implementation of a natural gas-to-gasoline process would decrease dependence on imported oil for transportation fuels. These factors make it very desirable to convert natural gas to more valuable liquids. There are commercial processes for converting natural gas to gasoline-range liquids. These processes, such as the Fischer-Tropsch synthesis and Mobil's MTG (Methanol To Gasoline), start with the steam reforming of methane. Steam reforming of methane requires the removal of sulfur compounds present in natural gas down to less than 0.1 ppm. This additional gas cleanup step, with its additional cost, is necessary because the catalysts are quickly poisoned by sulfur compounds.

9854 (PNL-SA–24416) **Modeling of the simulated countercurrent moving-bed chromatographic reactor used for the oxidative coupling of methane.** Tonkovich, A.L.Y. (Pacific Northwest Lab., Richland, WA (United States)); Carr, R.W. Pacific Northwest Lab., Richland, WA (United States); Minnesota Univ., Minneapolis, MN (United States). Dept. of Chemical Engineering and Materials Science. Sep 1994. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76ER02945 ; AC06-76RL01830. (CONF-940920–2: 13. international symposium on chemical reaction engineering, Baltimore, MD (United States), 25 Sep 1994). Order Number DE95004930. Source: OSTI; NTIS; GPO Dep.

The oxidative coupling reaction of methane (OCM) is a potential industrial reaction for the efficient production of ethylene. Replacement of current technologies requires significant product yield improvements. An experimental novel reactor design, the modified simulated countercurrent moving-bed chromatographic reactor (SCMCR), has reported improved ethane and ethylene product yields over other reported values. An understanding of the reactor operation is aided by concurrent mathematical modeling. The model mimics the exact experimental reactor configuration. Four sections are used; each section contains a reaction column and two separation columns connected in series. The feed is switched from section to section at discrete intervals. Reaction occurs in the first column and is followed by product and reactant separation in the ensuing section columns. Langmuir adsorption isotherms are used. The model does not incorporate the realistic and complex kinetics rising, from the OCM, rather a simplified reaction term is used to qualitatively gain insight into the operation of the modified SCMCR. A unimolecular reaction network is used in the model. The rate constants are set to permit a small fractional conversion, 5% per pass, at the concentrations during the first cycle. Similarly to the experimental reactor, the model adds a make-up feed (defined as percentage of the original feed, where excess methane is fed during the first cycle of the experimental reactor) to augment lost reactants.

9855 (DOE/EA–0928) **Burlington Bottoms Wildlife Mitigation Project. Final environmental assessment/management plan and finding of no significant impact.** USDOE Bonneville Power Administration, Portland, OR (United States). Dec 1994. 86p. Sponsored by USDOE, Washington, DC (United States). (DOE/BP–2526). Order Number DE95006490. Source: OSTI; NTIS; INIS; GPO Dep.

Bonneville Power Administration (BPA) proposes to fund wildlife management and enhancement activities for the Burlington bottoms wetlands mitigation site. Acquired by BPA in 1991, wildlife

habitat at Burlington bottoms would contribute toward the goal of mitigation for wildlife losses and inundation of wildlife habitat due to the construction of Federal dams in the lower Columbia and Willamette River Basins. Target wildlife species identified for mitigation purposes are yellow warbler, great blue heron, black-capped chickadee, red-tailed hawk, valley quail, spotted sandpiper, wood duck, and beaver. The Draft Management Plan/Environmental Assessment (EA) describes alternatives for managing the Burlington Bottoms area, and evaluates the potential environmental impacts of the alternatives. Included in the Draft Management Plan/EA is an implementation schedule, and a monitoring and evaluation program, both of which are subject to further review pending determination of final ownership of the Burlington Bottoms property.

9857 (DOE/BP/91964–2) **Significance of selective predation and development of prey protection measures for juvenile salmonids in the Columbia and Snake River reservoirs. Annual progress report, February 1991–February 1992.** Poe, T.P. (ed.). Fish and Wildlife Service, Portland, OR (United States). Columbia River Field Station. [1992]. 103p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI79-88BP91964. Order Number DE95004890. Source: OSTI; NTIS; GPO Dep.

This document is the 1991 annual report of progress for the Bonneville Power Administration (BPA) research Project conducted by the US Fish and Wildlife Service (FWS). Our approach was to present the progress achieved during 1991 in a series of separate reports for each major project task. Each report is prepared in the format of a scientific paper and is able to stand alone, whatever the state of progress or completion. This project has two major goals. One is to understand the significance of selective predation and prey vulnerability by determining if substandard juvenile salmonids (dead, injured, stressed, diseased, or naive) are more vulnerable to predation by northern squawfish, than standard or normal juvenile salmonids. The second goal is to develop and test prey protection measures to control predation on juvenile salmonids by reducing predator-smolt encounters or predator capture efficiency.

14 SOLAR ENERGY

9858 (ETDE-DE–22) **Investigations of photovoltaic system performance at the Widderstall photovoltaic test plant. Final report.** Bleil, A.; Klotz, F.H.; Knaupp, W.; Kueber, P.; Stellbogen, D.; Weeber, V. Zentrum fuer Sonnenenergie- und Wasserstoff-Forschung (ZSW), Stuttgart (Germany). Oct 1993. 216p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0329048A. Order Number DE95746684. Source: OSTI; NTIS (US Sales Only).

The project was carried out successfully. The investigations yielded important findings which can be applied for improving photovoltaic energy conversion systems. They are presented in detail in Sections 2 to 5. (orig./HW)

1405 Solar Energy Conversion

9859 (DOE/ER/13247–T1) **Reaction kinetics and product distributions in photoelectrochemical cells. Report on research activities, March 15, 1991–March 14, 1994.** Koval, C.A. Colorado Univ., Boulder, CO (United States). Sep 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84ER13247. Order Number DE95005572. Source: OSTI; NTIS; GPO Dep.

Semiconductor/liquid junction solar cells, also called photoelectrochemical cells (PEC), represent a versatile way to use solar energy. Photon energy can be used to make electricity and chemical fuels or can be used as an alternative to thermal activation energy in photocatalytic cells. Two fundamental processes associated with photoelectrochemical solar energy conversion were investigated experimentally: (i) Reactions of 'hot' electrons, and (ii) Electrode kinetics at 2-dimensional materials.

9860 (NREL/TP–411-7416) **Recent progress in the photovoltaic manufacturing technology project (PVMaT).** Witt, C.E. (National Renewable Energy Lab., Golden, CO (United States)); Mitchell, R.L.; Thomas, H.; Herwig, L.O.; Ruby, D.S.; Sellers, R. National Renewable Energy Lab., Golden, CO (United States); Sandia National Labs., Albuquerque, NM (United States). Dec 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-941203–14: 1. world conference on photovoltaic energy conversion, Waikoloa, HI (United States), 5-9 Dec 1994; SAND–94-3078C). Order Number DE95000279. Source: OSTI; NTIS; GPO Dep.

The Photovoltaic Manufacturing Technology (PVMaT) Project was initiated in 1990 to help the US photovoltaic (PV) industry extend its world leadership role in manufacturing and commercially developing PV modules and systems. It is being conducted in several phases, staggered to support industry progress. The four most recently awarded subcontracts (Phase 2B) are now completing their first year of research. They include two subcontracts on CdTe, one on Spheral Solar™ Cells, and one on cast polysilicon. These subcontracts represent new technology additions to the PVMaT Project. Subcontracts initiated in earlier phases are nearing completion, and their progress is summarized. An additional phase of PVMaT, Phase 4A, is being initiated which will emphasize product-driven manufacturing research and development. The intention of Phase 4A is to emphasize improvement and cost reduction in the manufacture of full-system PV products. The work areas may include, but are not limited to, issues such as improvement of module manufacturing processes; system and system component packaging, integration, manufacturing, and assembly; product manufacturing flexibility; and balance-of-system development with the goal of product manufacturing improvements.

9861 (NREL/TP–452-7461) **Design goals and challenges for a photovoltaic-powered electrochromic window covering.** Benson, D.K.; Branz, H.M. National Renewable Energy Lab., Golden, CO (United States). Dec 1994. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-9410282–1: 1. international meeting on electrochromism, Venice (Italy), 19-21 Oct 1994). Order Number DE95000284. Source: OSTI; NTIS; GPO Dep.

An estimated 1.0%-1.5% of the total cooling energy need in U.S. buildings, and 10%-30% of the peak electric utility power demand, is caused by unwanted solar heat-gain through windows. A large fraction of the approximately two billion square meters of building windows in the United States could benefit from the use of some solar gain control strategy. If a cost-effective, retrofit, electrochromic (EC) window covering were available, this energy savings potential could be realized in a relatively short time. A "glue on", retrofit EC window treatment, similar to conventional static solar-gain control .films, could accelerate the application of this new technology in buildings. However, the costs of electrical wiring for each retrofitted window could dominate the economics of the retrofit decision and slow market acceptance of EC-windows. By incorporating a photovoltaic (PV) power source into the EC window retrofit, this wiring cost could be reduced or eliminated, and the installation of the EC window treatment could be greatly simplified. In this paper, we suggest the use of an integrated, photovoltaic-powered electrochromic (PV-EC) window treatment that can be applied to an existing window in much the same way that conventional, static, solar-gain control films are now applied. This concept is the subject of a new three-year research and development (R&D) project at

our laboratory. We present our design concepts and rationale and identify some of the technical challenges involved.

9862 (SAND–94-3001C) **Optical features of nanosize iron and molybdenum sulfide clusters.** Wilcoxon, J.P.; Samara, G.; Newcomer, P. Sandia National Labs., Albuquerque, NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941144–49: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95005417. Source: OSTI; NTIS; GPO Dep.

In the bulk state FeS_2 and MoS_2 are optically opaque, narrow bandgap semiconductors and MoS_2 have bandgaps that with no optical applications. We demonstrate that nanosize FeS_2 can be adjusted to the visible and even UV region of the spectrum by control of the cluster size. This opens up a host of applications of these materials as inexpensive solar photocatalysts. We demonstrate that the band-gap of both materials shifts to the blue with decreasing size but ceases shifting when a size of ~3 nm (in the case of MoS_2) is attained. We interpret this observation as a change from bulk quantum confinement of the hole-electron pair of a tiny semiconductor to a set of discrete molecular-like transitions more characteristic of a whopper molecule. Room temperature photoemission studies of these clusters demonstrate that, while photoemission shifts to the blue with increasing bandgap for large clusters, small clusters have photoemission exclusively from trapped sub-bandgap surface states. Chemical modification of the surface to introduce hole or electron traps can result in either an enhancement or a decrease in the photoluminescence. In addition, we report our results concerning chemical purification and preliminary surface characterization of MoS_2 clusters by chromatography.

9863 (DTU-LV–95-3) **Canadian/Dutch/Danish cooperation on low flow solar heating systems.** Furbo, S. Danmarks Tekniske Univ., Lyngby (Denmark). Lab. for Varmeisolering. Jan 1995. 11p. Contract ENS-51181-94.0079. Order Number DE95755094. Source: OSTI; NTIS.

Experimental and theoretical investigations which compare the thermal performance of low flow heating systems and traditional high flow systems were carried out. When designing a solar heating system, comparison testing with high and low flow operation can provide guidance for the choice of flow regime. Improvement of thermal stratification by changing from high to low flow operation is of major interest in this respect. It was concluded that for certain well-designed systems, low flow operation can result in slightly greater thermal performance than is the case for high flow systems. The difference in thermal performance appears to be larger in the case of the tested mantle system and even larger if the difference in the thermal stratification in the heat storage facility is greater. Thermal stratification was most improved in the case of the tested mantle system. (AB)

Schlussbericht BBW-Projekt REN 88/33.

Solar reactors have been designed to conduct thermochemical processes for the production of solar fuels and chemicals. The decarbonation process of limestone has been selected as a model reaction in order to demonstrate the feasibility of atmospheric open solar reactors. This report describes the principles of two solar reactors which are based on the volumetric absorption concept of concentrated solar light. The related infrastructure, e.g. the solar concentrating systems at PSI, are also described. (author) 14 figs., 1 tab., 22 refs.

1410 Solar Collectors and Concentrators

9867 (DTU-LV–95-1) **Efficiency of solar collectors at varying wind velocities.** Froesig Jensen, F. Danmarks Tekniske Univ., Lyngby (Denmark). Lab. for Varmeisolering. Jan 1995. 17p. (In Danish). Order Number DE95744858. Source: OSTI; NTIS.

The aim was to investigate the efficiency of solar collectors at various velocities of wind passing over their surfaces. Solar collectors with the trade names Agena, Arcon and Aidt were studied. It was found that there was a significant relation between the efficiency of the collectors and the wind speed. Wind correction factors were established, based on measurements taken and relevant theories. (AB)

9868 (DTU-LV–95-2) **Dependence of solar collectors on diffuse solar radiation.** Froesig Jensen, F. Danmarks Tekniske Univ., Lyngby (Denmark). Lab. for Varmeisolering. Jan 1995. 11p. (In Danish). Order Number DE95744859. Source: OSTI; NTIS.

The aim was to discover the relation between solar collector efficiency and amounts of diffuse solar radiation. A "Batec" solar collector was used for testing purposes. Measurements were taken out of doors and diffuse solar radiation was reckoned as direct radiation at an angle of 60%. Correction factors were established but, because of testing conditions,there was a degree of uncertainty. (AB)

9869 (NEI-DK–1827) **Investigation of non-pressurized preheating container for a solar heating system.** Katic, I. Dansk Teknologisk Inst., Taastrup (Denmark). Proevestationen for Solenergi. Oct 1994. 25p. (In Danish). Contract ENS-51181-93.0029. Order Number DE95744848. Source: OSTI; NTIS.

Measurements were taken on two prototypes of non-pressurized hot water containers for smaller solar heating systems. The containers were equipped with immersed heat exchangers, one of which was constructed of plastic whilst the other had a spiral of stainless steel. The tanks were connected to a traditional hot water container so that self-circulation from the preheating container to the existing container was possible. The water in the solar collector functioned as a storage medium in the preheating container and the accumulated heat was transferred to the domestic hot water via the heat exchangers. The heat transfer process was found to be barely acceptable because of the poor quality of the natural circulation on both sides of the heat exchanger's walls instead of forced circulation from one side only. The heat exchanger constructed of plastic

and stainless steel functions better than the heat exchanger with a spiral partly because of its larger surfaces and lower heat losses. Use of a non-pressurized container is economically attractive but larger heat exchangers for self circulation would be more costly. It is thus important to find cheaper production methods. (AB)

9870 (NEI-DK–1864) **Cheap solar heating systems connected to the existing hot water container.** Vejsig Pedersen, P. Cenergia ApS, Ballerup (Denmark). Nov 1994. 77p. (In Danish). Contract ENS-51181-92.0058. Order Number DE95755099. Source: OSTI; NTIS.

The aim was to cooperate with interested solar collector and container manufacturers in developing containers and heat transfer systems so that hot water containers can in the future be more easily and cheaply prepared for use in solar heating systems. Heat exchangers with self circulation to hot water containers and containers in rows were tested, a test was developed for a cheaper heat transfer unit with built-in heat storage and self-circulation to existing hot water containers, and experiments were carried out on the adjustment of existing hot water containers for use in solar heating systems. Testing methods are explained and results are given in detail. (AB)

1420 Heat Storage

9871 (NEI-DK–1863) **Illustration of the Tubberupvaenge total energy design.** Vejsig Pedersen, P. Cenergia ApS, Ballerup (Denmark). Dec 1994. 44p. Contract ENS-1213/91-0018. Order Number DE95755098. Source: OSTI; NTIS.

EFP-91.

The publication comprises photographs of the buildings, parts of building constructions and details of heating, ventilation and storage systems etc. from the building complex called 'Tubberupvaenge' (Denmark). The complex was constructed with the overall aim of energy conservation and environmental protection in mind. The photographs are provided with texts which explain design and technological details to illustrate how these aims were achieved. Solar heating is used extensively. (AB)

9872 (NEI-DK–1865) **A cheap solar heating system connected to the existing hot water container. Sub-report - testing of containers in rows.** Kofod, P. Cenergia ApS, Ballerup (Denmark). Dec 1993. 26p. (In Danish). Contract ENS-51181-92.0058. Order Number DE95755100. Source: OSTI; NTIS.

This sub-report of the report of the same main title deals with the testing of hot water containers in a row in relation to solar heating systems. The water in the containers should be heated via the solar heating system and supplementary heat would come from a district heating plant or from electric heating. The types of transfer of solar heat were with the help of a spiral, a mantle and a heat exchanger and self circulation. A considerable amount of diagrams, photographs and graphs illustrate the text. (AB)

1430 Health and Safety

9873 (BNL–61322) **Lessons learned from a hydrogen explosion at a photovoltaic research facility.** Moskowitz, P. (Brookhaven National Lab., Upton, NY (United States)); Buchanan, W.; Shafarman, W. Brookhaven National Lab., Upton, NY (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-941203–20: 1. world conference on photovoltaic energy conversion, Waikoloa, HI (United States), 5-9 Dec 1994). Order Number DE95006689. Source: OSTI; NTIS; GPO Dep.

At the Institute of Energy Conversion (IEC), University of Delaware, a hydrogen explosion occurred an September 1, 1992. A formal investigation was conducted. Suggestions provided by the Accident Investigation Team formed the basis for a complete review and upgrade of the compressed gas handling systems and procedures. In this paper, the causes of the explosion are discussed along with resulting modifications made to the gas handling system, facility, and procedures to prevent a recurrence of this type of incident and to improve the safety of this facility. Lessons learned from this incident and the resulting investigation and response are highlighted, including the need to regularly review both hardware and procedures to ensure that all aspects of the research program and facilities are up-to-date.

9874 (BNL–61324) **Health and environmental hazards of CdTe photovoltaic module production, use and decommissioning.** Moskowitz, P.D. (Brookhaven National Lab., Upton, NY (United States)); Steinberger, H.; Thumm, W. Brookhaven National Lab., Upton, NY (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-941203–21: 1. world conference on photovoltaic energy conversion, Waikoloa, HI (United States), 5-9 Dec 1994). Order Number DE95006688. Source: OSTI; NTIS; GPO Dep.

Health and environmental (H&E) risks presented by CdTe photovoltaic module production, use and decommissioning have been reviewed and discussed by several authors. Several H&E concerns exit. The estimated risks are based on extrapolations of toxicity, environmental mobility, and bioavailability data for other inorganic cadmium compounds. Little information, however, is available about CdTe itself. In response to the increased interest in CdTe, Brookhaven National Laboratory (BNL) has been engaged in a cooperative research program with the National Institute of Environmental Health Sciences (NIEHS), the Fraunhofer Institute for Solid State Technology (IFT), and the GSF Institute of Chemical Ecology to develop fundamental toxicological and environmental data for CdTe. This paper describes the results of these studies, and their potential implications with respect to the H&E hazards presented by CdTe module production, use and decommissioning.

9875 (EGG-M–94230) **Long-Term Flow Test No. 1, Roosevelt Hot Springs, Utah.** Faulder, D.D. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-941043–7: 1994 annual meeting of the Geothermal Resources Council: restructuring the geothermal industry, Salt Lake City, UT (United States), 2-5 Oct 1994). Order Number DE95004995. Source: OSTI; NTIS; GPO Dep.

The Roosevelt Hot Springs, Utah geothermal field has been the site of numerous investigations into the behavior of a geothermal system. However, a detailed description of the reservoir is lacking. This paper presents the results of the 237 day Long-Term Flow Test No. 1, conducted in 1977 and 1978, followed bgy a 100 day pressure buildup. The responses from one production well and three pressure observation wells, ranging 600 to 12,000 feet from the production well, were used. This study illustrates the utility of a reevaluation of a geothermal system using old, pre-exploitation data is part of an ongoing case study of the Roosevelt Hot Springs system. Specific objectives are an improved interpretation of the geothermal reservoir, an estimate of aquifer behavior, and the primary reservoir volume.

1502 Geology and Hydrology of Geothermal Systems

9876 (LA-SUB–95-10) **Simulating silicic eruptions at Long Valley, California as a method to understand processes that influence eruption phenomena associated with caldera formation. IGPP progress report, October 1, 1993–August 31, 1994.** Papike, J.J. (New Mexico Univ., Albuquerque, NM (United States). Inst. of Meteoritics); Servilla, M.S.; Wohletz, K.H. Los Alamos National Lab., NM (United States); New Mexico Univ., Albuquerque, NM (United States). Inst. of Meteoritics. [1994]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006697. Source: OSTI; NTIS; GPO Dep.

There are two primary objectives of this project. The first objective consists of developing a complete data set of physical parameters from Long Valley caldera and the Bishop Tuff to constrain the initial and boundary conditions for numerical simulations. The second objective will be the completion of a series of numerical simulations that will provide explicit and testable models constraining the evolution of the caldera eruption that formed the Long Valley caldera and associated pyroclastic deposits (Bishop Tuff). Achieving the proposed objectives will require two steps. First, a comprehensive analysis of the intracaldera Bishop Tuff will be performed using high precision micro-beam analytical techniques on melt inclusions found in quartz phenocrysts. Second, data obtained from the analysis of the intracaldera Bishop Tuff together with data obtained from other studies will be used to constrain the initial and boundary conditions of the numerical simulations. Preliminary simulations based on initial and boundary conditions defined by the caldera structure and volatile concentrations found in the intracaldera Bishop Tuff indicate that erupted pyroclastic material would not have the required momentum to escape the caldera depression.

9877 (LA-UR–94-3065) **Hot dry rock resources of the Clear Lake Area, Northern California.** Burns, K.L. Los Alamos National Lab., NM (United States). [1994]. 16p. Sponsored by Department of the Interior, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950514–6: World geothermal congress: worldwide utilization of geothermal energy, Florence (Italy), 18-31 May 1995). Order Number DE95000874. Source: OSTI; NTIS; GPO Dep.

The Geysers-Clear Lake geothermal area of northern California is underlain by an asthenospheric upwarp. The upwarp was generated at a slabless window trailing the northward-moving Mendocino triple junction. The geothermal area lies immediately east of the Rodgers Creek rather than the San Andreas fault because of a transform jump in progress. Decompression melting of the mantle has led to basaltic underplating, and crustal anatexis. The high heat flow is due to conduction through a thin lithosphere and the latent heat of solidifying basalt, while the uniformity is due to the distribution of sources over a wide area of large flatlying sills, The Hot Dry Rock resource has heat flow exceeding 4 HFU over an area exceeding 800 km2.

9878 (LBL–36262) **Active magmatic degassing in the NW geysers high-temperature reservoir.** Kennedy, B.M.; Truesdell, A.H. Lawrence Berkeley Lab., CA (United States). Oct 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-941043–8: 1994 annual meeting of the Geothermal Resources Council: restructuring the geothermal industry, Salt Lake City, UT (United States), 2-5 Oct 1994). Order Number DE95006577. Source: OSTI; NTIS; GPO Dep.

Noble gas isotope abundances in steam from selected wells of the Coldwater Creek field of the NW Geysers, California, show mixing between a nearly pure mid-ocean ridge basalt (MORB) type magmatic gas with high $^3He/^4He$ and low radiogenic Ar ($R/Ra > 8.3$ and $^{40}Ar/^4He < 0.07$), and a magmatic gas diluted with crustal gas ($R/Ra < 6.6$ and $^{40}Ar/^4He > 0.25$). Gases with the highest magmatic component are from wells producing entirely (or in large part) from the high-temperature reservoir (HTR), while gases with the most crustal dilution are generally produced from the overlying normal vapor-dominated reservoir. The MORB-type magmatic gas is interpreted to show (among other things) that (1) part of the high gas of the HTR in the NW Geysers is supplied by active degassing of an underlying magma body indicated by earlier geophysical studies; (2) the HTR was formed by rapid heating and boiling of existing reservoir liquid caused by injection of magma; and (3) the large-scale convection found in the south and central Geysers does not exist in the northwest part of the field.

1503 Geothermal Exploration and Exploration Technology

9879 (SAND–94-2074C) **A drillable straddle packer for lost circulation control in geothermal drilling.** Glowka, D.A. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950514–1: World geothermal congress: worldwide utilization of geothermal energy, Florence (Italy), 18-31 May 1995). Order Number DE94017420. Source: OSTI; NTIS; GPO Dep.

Lost circulation is a persistent problem in geothermal drilling and often accounts for a significant fraction of the cost of drilling a typical geothermal well. The US Department of Energy sponsors work at Sandia National Laboratories to develop technology for reducing lost circulation costs. This paper describes a downhole tool that has been developed at Sandia for improving the effectiveness and reducing the cost of cementing operations used to treat lost circulation zones. This tool, known as the drillable straddle packer, is a low-cost, disposable assembly used for isolating a loss zone and directing the flow of cement into the zone. This paper describes the tool concept, hardware design, deployment procedure, laboratory testing, and technical issues addressed during the development process.

1504 Legislation and Regulations

9880 (LA-UR–94-2885) **Honduras geothermal development: Regulations and opportunities.** Goff, S.J.; Winchester, W.W. Los Alamos National Lab., NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950514–3: World geothermal congress: worldwide utilization of geothermal energy, Florence (Italy), 18-31 May 1995). Order Number DE94018320. Source: OSTI; NTIS; GPO Dep.

The US Department of Energy (DOE) through the Assistant Secretary for Policy, Planning, and Evaluation funded a project to review and evaluate existing power sector laws and regulations in Honduras. Also included in the scope of the project was a review of regulations pertaining to the privatization of state-run companies. We paid particular attention to regulations which might influence opportunities to develop and commercialize Honduras' geothermal resources. We believe that Honduras is well on the road to attracting foreign investment and has planned or has already in place much of the infrastructure and legal guarantees which encourage the influx of private funds from abroad. In addition, in light of current power rationing and Honduras' new and increasing awareness of the negative effects of power sector development on the environment, geothermal energy development is even more attractive. Combined, these factors create a variety of opportunities. The potential for private sector development of geothermal positive.

9881 (LA-UR–95-775) **Geothermal development in Australia.** Burns, K.L. (Los Alamos National Lab., NM (United States)); Creelman, R.A.; Buckingham, N.W.; Harrington, H.J. Los Alamos National Lab., NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950514–9: World geothermal congress: worldwide utilization of geothermal energy, Florence (Italy), 18-31 May 1995). Order Number DE95007837. Source: OSTI; NTIS; GPO Dep.

In Australia, natural hot springs and hot artesian bores have been developed for recreational and therapeutic purposes. A district heating system at Portland, in the Otway Basin of western Victoria, has provided uninterrupted service for 12 Sears without significant problems, is servicing a building area of 18 990 m^2, and has prospects of expansion to manufacturing uses. A geothermal well has provided hot water for paper manufacture at Traralgon, in the Gippsland Basin of eastern Victoria. Power production from hot water aquifers was tested at Mulka in South Australia, and is undergoing a four-year production trial at Birdsville in Queensland. An important Hot Dry Rock resource has been confirmed in the Cooper Basin. It has been proposed to build an HDR experimental facility to test power production from deep conductive resources in the Sydney Basin near Muswellbrook.

1506 Environmental Aspects

9882 (DOE/EIS–0224-Exec.Summ.) **Southeast Regional Wastewater Treatment Plant Facilities Improvements Project and Geysers Effluent Pipeline Project. Draft EIR/EIS: Executive summary.** Environmental Science Associates, Inc., San Francisco, CA (United States). 26 May 1994. 94p. Sponsored by USDOE, Washington, DC (United States);Department of the Interior, Washington, DC (United States). Order Number DE95006716. Source: OSTI; NTIS; INIS; GPO Dep.

The Southeast Regional Wastewater Treatment Plant (SERWTP) Facilities Improvement Plan and Geysers Effluent Pipeline and Effluent Injection Project are proposed as a plan to provide expanded wastewater treatment capabilities and to dispose of the effluent by injection in The Geysers geothermal field for purposes of power production. The project is located predominantly in the County of Lake, California, and also in part of Sonoma County. The plan includes various conventional facilities improvements in wastewater treatment to a secondary level of treatment at the SWERWTP. The plan includes facilities to convey the treated effluent in a 26-mile, 24-inch inside diameter pipeline to the Southeast Geysers. The wastewater from the SERWTP would be supplemented by raw lake water diverted from nearby Clear Lake. At The Geysers, the effluent would be directed into a system of distribution lines to wells. In the geothermal reservoir, the water will be converted to steam and collected in production wells that will direct the steam to six existing power plants. This document is a summary of a combined full Environmental Impact Report (EIR) and Environmental Impact Statement (EIS). The EIR/EIS describes the environmental impacts of the various components of the project. Mitigation measures are suggested for reducing impacts to a less than significant level.

9883 (DOE/EIS–0224-Vol.1) **Southeast Regional Wastewater Treatment Plant Facilities Improvements Project and Geysers Effluent Pipeline Project. Draft EIR/EIS, Volume 1 of 2.** Environmental Science Associates, Inc., San Francisco, CA (United States). 26 May 1994. 802p. Sponsored by USDOE, Washington, DC (United States);Department of the Interior, Washington, DC (United States). Order Number DE95006714. Source: OSTI; NTIS; INIS; GPO Dep.

The primary focus of this environmental analysis is on improvements to the Southeast Regional Wastewater Treatment Plant (SRWTP) facilities and disposal to the Geysers for injection. This analysis will be incorporated with an earlier EIR which evaluated system improvements to the SRWTP and twelve disposal alternatives. In July 1993, the Lake County Sanitation District Board of Directors (LACOSAN) selected the Geysers Effluent Pipeline as the preferred alternative to be analyzed in this EIR/EIS. This environmental analysis will primarily focus on improvements to the SRWTP facilities and a 24 inch pipeline designed to carry up to 5,400 gallons per minute of secondarily treated wastewater. The wastewater will be transported from the Lake County Sanitation District's Southeast Regional Wastewater Treatment Plant, Middletown Wastewater Treatment Plant with additional make-up water from Clear Lake to the Southeast portion of the Geysers Geothermal Field in Lake and Sonoma Counties, California.

9884 (DOE/EIS–0224-Vol.2) **Southeast Regional Wastewater Treatment Plant Facilities Improvements Project and Geysers Effluent Pipeline Project. Draft EIR/EIS, Volume 2 of 2: Appendices.** Environmental Science Associates, Inc., San Francisco, CA (United States). 26 May 1994. 211p. Sponsored by USDOE, Washington, DC (United States);Department of the Interior, Washington, DC (United States). Order Number DE95006715. Source: OSTI; NTIS; INIS; GPO Dep.

The Southeast Regional Wastewater Treatment Plant (SERWTP) Facilities Improvement Plan and Geysers Effluent Pipeline and Effluent Injection Project are proposed as a plan to provide expanded wastewater treatment capabilities and to dispose of the effluent by injection in The Geysers geothermal field for purposes of power production. The project is located predominantly in the County of Lake, California, and also in part of Sonoma County. The plan includes various conventional facilities improvements in wastewater treatment to a secondary level of treatment at the SWERWTP. The plan includes facilities to convey the treated effluent in a 26-mile, 24-inch inside diameter pipeline to the Southeast Geysers. The wastewater from the SERWTP would be supplemented by raw lake water diverted from nearby Clear Lake. At The Geysers, the effluent would be directed into a system of distribution lines to wells. In the geothermal reservoir, the water will be converted to steam and collected in production wells that will direct the steam to six existing power plants. This document is a summary of a combined full Environmental Impact Report (EIR) and Environmental Impact Statement (EIS). The EIR/EIS describes the environmental impacts of the various components of the project. Mitigation measures are suggested for reducing impacts to a less than significant level. This report contains appendices A and B. Appendix A contains notices of preparation/notices of intent and EIR/EIS scoping comments. Appendix B contains GeothermEx, Inc., analysis of Geothermal Reservoir Effects and Induced Seismicity.

9885 (DOE/EIS–95006712) **Southeast Regional Wastewater Treatment Plant facilities improvements and Geysers effluent pipeline and injection project: Mitigation monitoring and operation plan.** Lake County Planning Dept., Lakeport, CA (United States). [1994]. 23p. Sponsored by USDOE, Washington, DC (United States);Department of the Interior, Washington, DC (United States). Order Number DE95006712. Source: OSTI; NTIS; INIS; GPO Dep.

Pursuant to the recommendation of the Lake County Planning Commission on August 25, 1994, the following mitigation monitoring and operation plan is hereby recommended to the Lake County Sanitation District Board of Directors for the construction and operation of treatment plant improvements, Clear Lake make up water intake line, a 24 inch diameter 26 mile long effluent transmission pipeline to the southeast portion of the Geysers, connection of pipeline to the Middletown Wastewater Treatment Plant, distribution piping to approximately (15) injection wells in the Unit 13 and 16 steamfields operated by Calpine, the Northern California Power Agency's steamfield on US BLM lands in Lake and Sonoma Counties, and the Unit 18 and 20 steamfields in Sonoma county operated by Union Oil Company of California (Unocal). The authorized project also includes pump stations located at the Lake water intake, Southeast Treatment Plant and Bear Canyon geothermal leasehold, surge tank facilities at Childers Peak and the "Y" Pad in NCPA's steamfield in the Geysers, electrical distribution lines, access roads, spoil disposal areas along the pipeline route, monitoring and mitigation measures, temporary laydown areas and incidental uses and activities as identified in the project EIR dated May 26, 1994. This plan outlines the methods by which the project will be built and operated. All the mitigation measures or alternatives that were recommended in the EIR have been incorporated into the project and plan. Provisions to address issues such as erosion/sedimentation, hydrology, vegetation/biological habitat, operations, air, noise, public health and safety, socioeconomic and visual resources are included in the plan.

9886 (DOE/EIS–95006713) **Southeast Regional Wastewater Treatment Plant Facilities Improvements Project and Geysers Effluent Pipeline Project. Final EIR/EIS.** Environmental Science Associates, Inc., San Francisco, CA (United States). 25 Aug 1994. 247p. Sponsored by USDOE, Washington, DC (United States);Department of the Interior, Washington, DC (United States). Order Number DE95006713. Source: OSTI; NTIS; INIS; GPO Dep.

On May 26, 1994, the Lake County Sanitation District and the US Bureau of Land Management released for public review a Draft Environmental Impact Report/Environmental Impact Statement (EIR/EIS) on the proposed Southeast Regional Wastewater Treatment Plant Facilities Improvements Project and Geysers Effluent Pipeline Project. A minimum 45-day review and comment period began on that date and notices were published in the Federal Register. The public review and comment period closed on July 26, 1994. Public hearings on the Draft EIMIS were held in Lakeport, CA, on June 30 and July 14, 1994. The first part of this document contains copies of the written comments submitted on the Draft EIR/EIS. It also contains summary paraphrased comments of the public hearings. The second part of this document contains responses to the comments.

1508 Geothermal Power Plants

9887 (LA-UR–94-2715) **Hot dry rock geothermal energy in the USA: Moving toward practical use.** Duchane, D. Los Alamos National Lab., NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950514–2: World geothermal congress: worldwide utilization of geothermal energy, Florence (Italy), 18-31 May 1995). Order Number DE94018085. Source: OSTI; NTIS; GPO Dep.

The technology for extracting geothermal energy from the vast hot dry rock (HDR) geothermal resource has been under development by the Los Alamos National Laboratory for about 25 years. In 1992–1993, an extensive flow-testing program was conducted at the Fenton Hill, New Mexico HDR Test Facility. During two segments of this test energy was produced at a rate of 4 thermal megawatts on a continuous basis for periods of 112 and 65 days, respectively. Surface and logging measurements showed no decline in the temperature of the water produced from the HDR reservoir during the flow testing. In fact, tracer evidence indicated that the circulating water was continually gaining access to additional hot rock as the testing proceeded. Water consumption was low and all other test data were positive. The encouraging results of the flow testing at Fenton Hill provided the incentive for the United States Department of Energy (USDOE) to solicit the interest of private industry in a jointly funded program to construct and operate a facility that would produce and sell energy derived from HDR resources. A number of organizations responded positively. On the basis of the interest expressed in these responses, the USDOE subsequently authorized the issuance of a formal solicitation to initiate the project.

9888 (BNL–61259) **Lightweight CO_2-resistant cements for geothermal well completions.** Kukacka, L.E.; Sugama, T. Brookhaven National Lab., Upton, NY (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950514–8: World geothermal congress: worldwide utilization of geothermal energy, Florence (Italy), 18-31 May 1995). Order Number DE95005965. Source: OSTI; NTIS; GPO Dep.

Materials formed by acid-base reactions between calcium aluminate compounds and phosphate-containing solutions yield high strength, low permeability and CO_2-resistant cements when cured in hydrothermal environments. The cementing formulations are pumpable at temperatures up to 150°C. thereby making their use for well completions technically feasible. When this cementing matrix was exposed in an autoclave containing Na_2CO_3,-saturated brine for 120 days. <0.4 wt% $CaCO_3$ was produced. A conventional portland cement-based well completion material will form ~10 wt% CACO, after only 7 days exposure. The addition of hollow aluminosilicate microspheres to the uncured matrix constituents yields slurries with densities as low as ~ 1.2 g/cc which cure to produce materials with properties meeting die criteria for well cementing. These formulations also exhibit low rates of carbonation. Laboratory characterization is nearing completion. engineering scale-up is underway, and plans for field testing in a variety of geothermal fluids are being made.

9889 (EGG-M–94013) **Viscous fingers in superheated geothermal systems.** Fitzgerald, S.D. (Univ. of Cambridge (United Kingdom)); Woods, A.W.; Shook, M. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States);Natural Environment Research Council, London (United Kingdom). DOE Contract AC07-76ID01570. (CONF-940120–7: 19. workshop on geothermal reservoir engineering, Stanford, CA (United States), 18-20 Jan 1994). Order Number DE95005039. Source: OSTI; NTIS; GPO Dep.

In this paper we investigate the physical controls upon the rate of vaporization of liquid as it is injected into a porous layer containing superheated vapor. We develop a simple model of the process and show that if liquid is injected at a relatively high rite, a small fraction of the liquid vaporizes and the porous layer becomes filled with hot liquid. In contrast, at low rates of injection a large fraction of the liquid may vaporize. We also describe a new and fundamental instability that can develop at a migrating liquid-vapour interface if the rite of injection is sufficiently small. This phenomenon is manifest in the form of liquid fingers growing from a liquid-vapour interface and is investigated through the use of analytical, experimental and numerical techniques.

9890 (LA-UR–94-3088) **Rock melting: A specialty drilling system for improved hole stability in geothermal wells.** Goff, S.J.; Bussod, G.Y.; Wohletz, K.; Cort, E.G.; Dreesen, D.S.; Rowley, J.C. Los Alamos National Lab., NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950514–7: World geothermal congress: worldwide utilization of geothermal energy, Florence (Italy), 18-31 May 1995). Order Number DE95001155. Source: OSTI; NTIS; GPO Dep.

A Los Alamos National Laboratory team is actively reevaluating a drilling system that uses electrically-heated graphite, or molybdenum penetrators to melt a hole as it is slowly pushed through rock. The primary result of a ROCK MELTING penetrator is to form molten material that consolidates into a rugged glass lining, thus preventing hole collapse and minimizing the potential for cross-flow and lost circulation. Drilling fluid requirements are reduced or eliminated, and the penetrator does not rotate. Laboratory bench tests are being coupled with time,-dependent thermomechanical models to understand the physics of the process and adapt ROCK MELTING to a variety of field environments. The potential geothermal drilling applications include a wellbore seal in lieu of intermediate casing particularly in areas of lost circulation or borehole wall collapse. Additionally, by modifying the penetrator tool, the system could be designed to melt through a stuck pipe or bit, thereby eliminating cementing and redrilling. Modification of the ROCK MELTING drill to allow injection of reagents and thinners into the melt to increase penetration rates, and enhance glass liner properties is also under investigation.

9891 (SAND–94-0462C) **The development of advanced synthetic-diamond drill bits for geothermal drilling.** Schater, D.M. Sandia National Labs., Albuquerque, NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950514–4: World geothermal congress: worldwide utilization of geothermal energy, Florence (Italy), 18-31 May 1995). Order Number DE94018894. Source: OSTI; NTIS; GPO Dep.

The advanced synthetic-drilled bit project is a cooperative research program aimed at developing synthetic-diamond drill bits capable of drilling into hard-rock formations. Eight drill companies have teamed with Sandia National Laboratories to work on five projects with the objective of developing advanced bit technology that results in new commercial products with longer bit life and higher penetration rates in hard formations. An overview of each research project is presented. Results of the program to date, including the design and development of a new single-cutter testing machine and single-cutter wear and cutting force test results are also discussed.

1510 Direct Energy Utilization

9892 (DOE/ID/13040–T26) **Geothermal direct-heat utilization assistance. Federal Assistance Program, Quarterly project progress report, October–December 1994.** Oregon Inst. of Tech., Klamath Falls, OR (United States). Geo-Heat Center. [1994]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-90ID13040. Order Number DE95007247. Source: OSTI; NTIS; GPO Dep.

The report summarizes activities of the Geo-Heat Center (GHC) at Oregon Institute of Technology for the first quarter of Fiscal Year 1995. It describes contacts with parties during this period related to assistance with geothermal direct heat projects. Areas dealt with include geothermal heat pumps, space heating, greenhouses, aquaculture, resources and equipment. Research is also being conducted on geothermal energy cost evaluation, low-temperature geothermal resource assessment, use of silica waste from the

Cerro Prieto geothermal field as construction materials and geothermal heat pumps. Outreach activities include the publication of a quarterly Bulletin on direct heat applications and dissemination of information on low-temperature geothermal resources and utilization.

9894 (NEI-DK–1869, pp. 155-165) **Some ideas on the modeling of atmospheric turbulence.** Winkelaar, D. (Netherlands Energy Research Foundation, ECN, Petten (Netherlands)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9406223–: International Energy Agency meeting on wind conditions for wind turbine design, Hamburg (Germany), 27-28 Jun 1994). In *IEA joint action. Wind conditions for wind turbine design.* 179p. Order Number DE95755095. Source: OSTI; NTIS.

In the introductory note to this IEA Symposium on Wind conditions for Wind Turbine Design 1994, the question is raised whether the actually occurring extreme wind conditions, which recently lead to severely damaged wind turbines, make a reconsideration and evaluation of the commonly used design basis necessary. In addition several related questions were formulated. In this paper, basically only one of these questions is addressed, namely: 'Is the format of currently used design guidelines concerning wind, i.e. extreme conditions and turbulence, sufficient, is it too simple, does it cover all the relevant situations?'. The main line of thought is that we should seek for characteristic features in the wind that are important of the (extreme) response of the wind turbine structure. The characteristic feature that is dealt with is the randomness of the wind. Different realizations of a stochastic wind field, which have the same statistics will generally lead to different load spectra. Several realizations are needed to get a reliable estimate of the highest load ranges. A few examples are shown. (EG)

This progress report gives the details of the design of a surface profiling system for the inspection of turbine blades.

9896 (NEI-DK–1814) **IEA joint action. Wind turbine fatigue.** Maribo Pedersen, B. (ed.). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. 145p. (CONF-9404235–: 3. IEA symposium on wind turbine fatigue, Petten (Netherlands), 21-22 Apr 1994). Order Number DE95744829. Source: OSTI; NTIS.

21 representatives of 7 countries met at the 3. IEA symposium on wind turbine fatigue in April 21-22 1994 in Petten (Netherlands). The number of hours a Wind Turbine should be able to sustain without major overhaul and under severe loading situations is unsurpassed in many other technologies. Durability and reliability are major aspects which have to be dealt with by designers of Wind Turbines (components). Fatigue is the major factor which influences durability of Wind Turbines. The major design driver in Wind Turbine engineering is, next to stability and strength, fatigue. For the MW-scale Wind Turbines stability and strength are sometimes the limiting phenomenon, but for the medium size machines fatigue is the major design driver. However for every Wind Turbine component fatigue is a major item to take care of during the design. The following list of subjects are mentioned for the symposium: Coupon testing and processing of results to design envelopes for materials. From design loads to test loads. Full scale testing. Gear box/drive train design. Fatigue properties related to manufacturing methods. E.g. tape winding versus hand lay-up or resin injection molding. (EG)

9897 (NEI-DK–1814, pp. 3-17) **Fatigue of glass-polyester laminates for wind turbine blades.** Bach, P.W. (ECN, Petten (Netherlands)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9404235–: 3. IEA symposium on wind turbine fatigue, Petten (Netherlands), 21-22 Apr 1994). In *IEA joint action. Wind turbine fatigue.* 145p. Order Number DE95744829. Source: OSTI; NTIS.

The most fatigue critical part of a wind turbine is the rotor blade structure and its connection to the hub. In a design life extending over more than 20 years it has to endure high cycle ($>10^8$) fatigue loading of variable amplitude due to gusts, wind shear, start and stop procedures etc. For a mechanical construction the fatigue of a wind turbine blade is a quite unusual matter due to the large number of cycles and the typical load spectrum. One of the materials that is extensively used in wind turbine blades is glass fibre reinforced polyester (GFRP). Very few data are available in the high cycle fatigue range to validate the lifetime prediction in combination with load sequence effects for the materials and substructures used in wind turbines. Specimens can be tested under realistic conditions with the load sequence WISPER which simulates the loads on the root of wind turbine blades. In order to predict the lifetimes with a Palmgren-Miner summation a sufficiently detailed Goodman diagram is necessary. For a detailed Goodman diagram fatigue curves at several R-ratio's are needed. In the project constant amplitude and variable amplitude fatigue tests were performed, in order to obtain sufficient data for a Goodman diagram and for the verification of lifetime prediction methods. (au) (11 refs.)

9898 (NEI-DK–1814, pp. 19-54) **Database fact. Fatigue of composites for wind turbines.** Smet, B.J. de (Renewable Energy, Petten (Netherlands)); Bach, P.W. Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9404235–: 3. IEA symposium on wind turbine fatigue, Petten (Netherlands), 21-22 Apr 1994). In *IEA joint action. Wind turbine fatigue.* 145p. Order Number DE95744829. Source: OSTI; NTIS.

In 1985 a national research programme has been started to investigate the fatigue behavior of glass fibre reinforced polyester (GP). The purpose of the programme was to provide reliable data for the design and construction of rotor blades of wind turbines. At that time, only few data were available and limited to a small part of the load spectrum seen by rotor blades. Further a profound statistical evaluation of the available data was absent. Consequently large safety factors are being applied in the design of rotor blades up to now, resulting in a high mass and thus a high cost-p rice of rotor blades. From then, many constant and variable amplitude fatigue tests have been performed on GP coupon specimens and bolted joints at various load levels within the national programme. Besides the involved research institutes have also been participating in EC research programmes on fatigue of GP and GE (glass fibre reinforced epoxy). Therefore a considerable amount of fatigue data is available for evaluation, which is now being performed as a part of the national programme. In this report the first stage of the evaluation is described. In this stage data have been collected in a database and programmes have been written to select and plot data in fatigue diagrams, and to perform a statistical analysis for the construction of Goodman diagrams for design purposes. The database is named FACT, which stands for FAtigue of Composites for wind Turbines. (au)

9899 (NEI-DK–1814, pp. 55-62) **EN-WISPER.** Bruijn, J.C.M. de (KEMA Inspection Technology, Plastics and Ruber, Arnhem (Netherlands)); Laak, J.A. ter; Ende, C.A.M. van den. Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9404235–: 3. IEA symposium on wind turbine fatigue, Petten (Netherlands), 21-22 Apr 1994). In *IEA joint action. Wind turbine fatigue.* 145p. Order Number DE95744829. Source: OSTI; NTIS.

The objective of the National Research Program on Fatigue of Fibre Reinforced Plastics for Wind Turbine Rotors, is to obtain reliable safety factors for both loading sequence and environmental aspects. The influence of the loading sequence can be simulated by using WISPER (Wind SPEctrum Reference), while the aims is to simulated the combined influence of loading sequence and environmental aspects with EN-WISPER (EN for Environmental). A part of the contribution of the KEMA in the National Research Program, is the development of this accelerated environmental test for use in combination with the well-known WISPER fatigue loading. The objective of the underlying study is to develop a test spectrum/pre-conditioning procedure, representative for the influence of environmental aspects which are (in this case) typical for The Netherlands. However, the systematic approach should guarantee an extension of the test to other materials and conditions. (au)

9900 (NEI-DK–1814, pp. 63-68) **Fatigue behaviour of fiberglass wind turbine blade material at the very high cycle range.** Delft, D.R.V. van (Delft University of Technology, Faculty of Civil Engineering, Dep. Mechanics and Constructions, STEVIN laboratory, Delft (Netherlands)); Rink, H.D.; Joosse, P.A. Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9404235–: 3. IEA symposium on wind turbine fatigue, Petten (Netherlands), 21-22 Apr 1994). In *IEA joint action. Wind turbine fatigue.* 145p. Order Number DE95744829. Source: OSTI; NTIS.

Fatigue tests are carried out on fiberglass wind turbine blade material. The tests are performed at low stress levels in order to obtain results at a number of cycles in the order of 500 millions. This is a typical number of cycles for material in a wind turbine rotor blade. The test results until now indicate that the relation between applied stress amplitude and number of cycles is better represented by a log-log relation than a linear-log relation. Furthermore there is no indication for a fatigue limit at this number of cycles. (au)

9901 (NEI-DK–1814, pp. 69-75) **Damage monitoring of fatigue tested glass/polyester coupons and components for wind turbine blades.** Lowe, G.A. (Faculty of Engineering, University of the West of England, Gristol (United Kingdom)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9404235–: 3. IEA symposium on wind turbine fatigue, Petten (Netherlands), 21-22 Apr 1994). In *IEA joint action. Wind turbine fatigue.* 145p. Order Number DE95744829. Source: OSTI; NTIS.

The University of the West of England (UWE) has tested glass reinforced polyester coupons and associated spar components within an EC JOULE programme and a UK Department of Energy funded contract. An overview of the overall testing programme and a comparison of fatigue results for coupons and components of fatigue results for coupons and components was given at the 1992 IEA Fatigue Experts Meeting. This paper concentrates more on the damage monitoring methods used in the fatigue testing of small coupons and large components, manufactured by the same method. The measurement of damage using reduction of sample stiffness, hysteresis looping, surface temperature, strain gauges, changes in natural frequency and other techniques have all been applied or are being developed in the work. (au)

9902 (NEI-DK–1814, pp. 77-87) **Fatigue case study and loading spectra for wind turbines.** Sutherland, H.J. (Wind Energy Technology, Sandia National Laboratories, Albuquerque, NM (United States)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9404235–: 3. IEA symposium on wind turbine fatigue, Petten (Netherlands), 21-22 Apr 1994). In *IEA joint action. Wind turbine fatigue.* 145p. Order Number DE95744829. Source: OSTI; NTIS.

The paper discusses two aspects of Sandia's Wind Energy Program. The first section of the paper presents a case study of fatigue in wind turbines. This case study was prepared for the American Society of Testing Material's (ASTM) Standard Technical Publication (STP) on fatigue education. Using the LIFE2 code, the student is lead through the process of cumulative damage summation for wind turbines and typical data are used to demonstrate the range of life estimates that will result from typical parameter variations. The second section summarizes the results from a workshop held by Sandia and the National Renewable Energy Laboratory (NREL) to discuss fatigue life prediction methodologies. This section summarizes the workshop discussions on the use of statistical modeling to deduce the shape and magnitude of the low-probability-of-occurrence, high-stress tail of the load distribution on a wind turbine during normal operation. (au) (11 refs.)

9903 (NEI-DK–1814, pp. 89-96) **Load spectra from measurements and regulations.** Nath, C. (Germanischer Lloyd, Hamburg (Germany)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9404235–: 3. IEA symposium on wind turbine fatigue, Petten (Netherlands), 21-22 Apr 1994). In *IEA joint action. Wind turbine fatigue.* 145p. Order Number DE95744829. Source: OSTI; NTIS.

Fatigue plays an increasingly important role in the design and certification of wind turbines. This is due to the fact that in the 'old days' wind turbines were of much smaller size and were analysed using more conservative codes. Quasistatic procedures were applied and the extreme loads were dimensioning. When wind turbines grew bigger and became specifically lighter the effects of mass and turbulence and the dynamic behaviour of the complete structure were to be looked at in more detail. Stochastic wind models and an aeroelastic, dynamic simulation of the wind turbine are the consequent development in engineering to account for this. For the verification of these models measurements of both loads and strains are absolutely necessary. In the following a short description is given of the evaluation of load spectra from measurements and a comparison with the simplified spectra in the German Regulations. (au)

9904 (NEI-DK–1814, pp. 97-108) **Experimental investigation of gearbox duration loadings on stall and pitch controlled wind turbines.** Markkilde Petersen, S. (The Test Station for Wind Turbines, Risoe National Laboratory, Roskilde (Denmark)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9404235–: 3. IEA symposium on wind turbine fatigue, Petten (Netherlands), 21-22 Apr 1994). In *IEA joint action. Wind turbine fatigue.* 145p. Order Number DE95744829. Source: OSTI; NTIS.

Gear box loadings is a main subject in designing wind turbines, and this paper describes an investigation of these loadings from measurements on a wide range of typical Danish stall and pitch controlled wind turbines. Gear box fatigue loadings can be divided into two categories; one with respect to the shaft loadings and the other one with respect to gear loadings, tooth root fracture and tooth pitting. The traditional Palmgren-Miner approach based on the number of load cycles of a certain range can be used in the first group, but concerning the gear tooth fatigue loadings a different approach is used. In a gear box operating under a certain torque load all teeth in the gear box will experience load cycles with constant amplitude, dependent on the torque, rotational speed and duration time. Thus for gear damage the fatigue damage rate may be expressed in terms of duration of the different torque levels. This paper focus on the latter one, and it is the aim to establish a method to estimated the gear gear box duration loadings on typical wind turbines. (au)

9905 (NEI-DK–1814, pp. 109-119) **Full scale fatigue testing of wind turbine rotor blades.** Delft, D.R.V. van (Delft University of Technology, Faculty of Civil Engineering, Dep. Mechanics and Constructions. STEVIN laboratory, Delft (Netherlands)); Leeuwen, J.L. van. Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9404235–: 3. IEA symposium on wind turbine fatigue, Petten (Netherlands), 21-22 Apr 1994). In *IEA joint action. Wind turbine fatigue.* 145p. Order Number DE95744829. Source: OSTI; NTIS.

Full scale fatigue test can be used as a final design verification of a wind turbine rotor blade. Stevin laboratory is carrying out these full scale tests over the last decade. Blades up to 26 metres have been full scale fatigue tested. In most of the tests loading applied is a variable amplitude and multidirectional load. This is in order to achieve an as realistic loading as possible. However, more

simplified loading can be used as well. In this paper the different aspects in full scale testing will be discussed. These aspects include the following. The advantages and disadvantages of the different testing methods are compared. The principles to evaluate a test loading are given. What is tested and what is not tested in such a test is discussed. Finally some examples of tests and test results are given. (au)

9906 (NEI-DK–1814, pp. 131-135) **Design approximation of GP fatigue data.** Joosse, P. (Stork Product Engineering B.V., Amsterdam (Netherlands)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9404235–: 3. IEA symposium on wind turbine fatigue, Petten (Netherlands), 21-22 Apr 1994). In *IEA joint action. Wind turbine fatigue.* 145p. Order Number DE95744829. Source: OSTI; NTIS.

Information on fatigue tests on glass fibre reinforced plastics has been gathered and stored in the so-called FACT database. For glass/polyester laminates with a lay-up consisting of at least 0 deg. and 45 deg. a statistical evaluation has been carried out. Characteristic values of the test data at different R-values are discussed and compared to predictions. The predictions are taken from certification rules (CIWI and GL) and are conservative. A strain based prediction is derived and is shown to be inclose agreement with the test data. (au)

9907 (NEI-DK–1814, pp. 137-143) **Lifetime of Gl-Ep rotor blade material under impact and moisture.** Kensche, C.W. (German Aerospace Research Establishment, Institute of Structures and Design, Stuttgart (Germany)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9404235–: 3. IEA symposium on wind turbine fatigue, Petten (Netherlands), 21-22 Apr 1994). In *IEA joint action. Wind turbine fatigue.* 145p. Order Number DE95744829. Source: OSTI; NTIS.

Within the EC project JOULE 1, the effect of moisture and hailstone impact were studied on the fatigue behaviour of glass-epoxy (Gl-Ep). The results were presented in the form of ϵ-N or Woehler curves. The aim of this review is to show the influence of these results on the lifetime of a fictive wind turbine, i.e. on the basis of WISPERX, a short derivation of the wind energy specific standard WISPER. (au)

9908 (NEI-DK–1853) **Pitch regulation of a wind turbine.** IMM-EKS, 1994-27. Oestergaard, P. Danmarks Tekniske Univ., Lyngby (Denmark). Inst. for Matematisk Modellering. Aug 1994. 153p. Order Number DE95755093. Source: OSTI; NTIS.

In the near future, large wind turbines ranging from 1 MW to 1.5 MW will be the standard. These large wind turbines will be very expensive and it is therefore very important to guarantee long durability and good reliability of the plant. This report deals with dynamic modelling and control of a large wind turbine. First a nonlinear model of the wind turbine is presented. A stochastic model for the wind is also introduced. The nonlinear model is then implemented as a modular simulation model. A linearized version of the model is used for control design. The control design includes design of a gain scheduled stochastic pole placement controller. To optimize produced electrical energy at low wind velocities, different optimization methods are discussed. Finally transition between optimization and limitation of produced electrical power is examined. Controllers and optimizations methods are evaluated on the simulation model. (au) (16 refs.)

9909 (NEI-DK–1855) **Frequency converter with current source inverter for windmill application.** Avkshtol, I. Nordvestjysk Folkecenter for Vedvarende Energi, Hurup (Denmark). Jul 1994. 68p. Order Number DE95755091. Source: OSTI; NTIS.

A frequency converter with current source inverter and a DC link transformer is under investigation in this paper. The converter is shown to reduce reactive power consumption in case of symmetric line commutation of the inverter. It is incapable of adequate operation in case when there are positive parts in the instantaneous value of inverter EMF because a low inductance of DC link does not limit a circulating current. Different modes of generator control for maximal output power by means of the converter are examined. A control system based on tracking the frequency of generator is recommended for low power application. The results of testing are given. The experience of building a standard converter from industrially manufactured blocks is described. Probale tendencies of farther converter development are discussed. (au)

9910 (NEI-DK–1869) **IEA joint action. Wind conditions for wind turbine design.** Maribo Pedersen, B. (ed.). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. 179p. (CONF-9406223–: International Energy Agency meeting on wind conditions for wind turbine design, Hamburg (Germany), 27-28 Jun 1994). Order Number DE95755095. Source: OSTI; NTIS.

The meeting, which was kindly hosted by Germanischer Lloyd, was attended by 20 delegates from Europe and USA aiming at exchange of experience and discussion of general aspects of Wind Conditions for Wind Turbine Design. The subjects and the presented papers covered a very broad range of aspects of wind conditions and related influence on the wind turbine as e.g. General wind conditions during normal operation and in extreme well defined situations (homogeneous terrain, wind farms, complex terrain) and methods to describe these and apply them for calculation of load on the wind turbine structure (deterministic or probabilistic approach, include turbine dynamics, aeroelastic calculation); Special extreme conditions (rare meteorological events and definition of corresponding load cases, combination of such extreme conditions - which events should be considered simultaneously?); Standards (comparison of different standards, load factors); Case studies (turbine failure and corresponding wind conditions); Results from research projects (long term wind farm measurements, application of probabilistic turbulence models) and Establishment of databases. During the meeting 15 participants presented papers dealing with these subjects. After each presentation a brief discussion of presented and related topics took place. (EG)

9911 (NEI-DK–1869, pp. 3-15) **The turbulent wind field in various terrain types and in windfarms.** Hoejstrup, J. (Risoe National Laboratory, Department of Meteorology and Wind Energy, Roskilde (Denmark)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9406223–: International Energy Agency meeting on wind conditions for wind turbine design, Hamburg (Germany), 27-28 Jun 1994). In *IEA joint action. Wind conditions for wind turbine design.* 179p. Order Number DE95755095. Source: OSTI; NTIS.

In order to be able to understand and predict the loads on wind turbines it is necessary to acquire knowledge about the turbulent wind field since the turbulence is the cause of some of the important load situations for wind turbines, especially for fatigue loading. In the following we will highlight some of the important aspects of turbulence in homogeneous terrain, since this is quite well understood, touch on the much more complicated situation of inhomogeneous terrain, and finally look at some of the results from Danish windfarms offshore, in flat coastal terrain and from a windfarm situated in the US in very complex terrain. (au) (12 refs.)

9912 (NEI-DK–1869, pp. 17-35) **Is the damage of the NWP400 wind turbine at Lyse Wind Power Station, 1993-10-16 1500-1800 LST, related to severe wind conditions?.** Bergstroem, H. (Department of Meteorology, Uppsala (Sweden)); Smedman, A.S. Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9406223–: International Energy Agency meeting on wind conditions for wind turbine design, Hamburg (Germany), 27-28 Jun 1994). In *IEA joint action. Wind conditions for wind turbine design.* 179p. Order Number DE95755095. Source: OSTI; NTIS.

Mean wind and turbulence conditions at Lyse Wind Power Station have been analysed during a three-hour period and compared with current boundary layer theory. The result shows that with a mean wind direction around 215 deg., both wind speed and turbulence intensity profiles, spectra and the coherence functions are affected by the heterogeneous surroundings. The lower parts of the profiles reflect the internal boundary layer associated with the sea and the upper parts of the boundary layer with the more rough islands situated at a longer distance. Although the site is surrounded by rocky islands the wind profiles as well as the turbulence characteristics can be described with models for homogenous terrain, if an overall roughness length of a few centimeters is used. Such a roughness length is representative of a typical farmland. It is possible that the

meteorological input data used for load calculations with the WI-DYN simulation code were not representative for the Lyse site. The input date were based on measurements at Alsvik and Naesudden, which are situated in a more homogenous type of terrain. (EG)

9913 (NEI-DK–1869, pp. 37-61) **Turbulence descriptors for scaling fatigue loading spectra of wind turbine structural components.** Kelley, N.D. (Wind Technology Division, National Renewable Energy Laboratory, Golden, Colorado (United States)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9406223–: International Energy Agency meeting on wind conditions for wind turbine design, Hamburg (Germany), 27-28 Jun 1994). In *IEA joint action. Wind conditions for wind turbine design.* 179p. Order Number DE95755095. Source: OSTI; NTIS.

The challenge for the designer in developing a new wind turbine is to incorporate sufficient strength in its components to safely achieve a 20- or 30-year service life. To accomplish this, the designer must understand the load and stress distributions (in a statistical sense at least) that the turbine is likely to encounter during its operating life. To accomplish this, the designer must understand the load and stress distributions (in a statistical sense at least) that the turbine is likely to encounter during its operating life. Sources of loads found in the normal operating environment include start/stop cycles, emergency shutdowns, the turbulence environment associated with the specific site and turbine location, and extreme or 'rare' event that can challenge the turbine short-term survivability. Extreme events can result from an operational problem (e.g., controller failure) or violent atmospheric phenomena (tornadic circulations, strong gust fronts). For the majority of the operating time, however, the character of the turbulent inflow is the dominant source of the alternating stress distributions experience by the structural components. Methods of characterizing or scaling the severity of the loading spectra (or the rate of fatigue damages accumulation) must be applicable to a wide range of turbulent inflow environments- from solitary isolation to the complex flows associated with multi-row wind farms. The metrics chosen must be related to the properties of the turbulent inflow and independent of the nature of local terrain features. (au)

9914 (NEI-DK–1869, pp. 63-68) **Gust direction and its impact on the out of service loads for a pitch regulated wind turbine.** Noakes, J. (Renewable Energy Systems Ltd, Hemel Hempstead, Herts (United Kingdom)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9406223–: International Energy Agency meeting on wind conditions for wind turbine design, Hamburg (Germany), 27-28 Jun 1994). In *IEA joint action. Wind conditions for wind turbine design.* 179p. Order Number DE95755095. Source: OSTI; NTIS.

Renewable Energy Systems Ltd. has recently completed a design study for a 1 MW horizontal axis wind turbine which was funded by the UK Department of Trade and Industry. Throughout the design study, consideration was given to the requirements of current design guidelines and certification rules. The purpose of this document is to compare and discuss some of the differences between the extreme out of service load cases used by RES and those defined in the Germanischer Lloyd Regulations, GL, and the draft IEC standard, TC88. (au)

9915 (NEI-DK–1869, pp. 69-72) **Selected field experience from the German '250 MW Wind Programme'.** Durstewitz, M. (Institut fuer solare Energieversorgungstechnik, ISET, Kassel (Germany)); Ensslin, C.; Hahn, B.; Hoppe-Kilpper, M.; Rohrig, K. Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9406223–: International Energy Agency meeting on wind conditions for wind turbine design, Hamburg (Germany), 27-28 Jun 1994). In *IEA joint action. Wind conditions for wind turbine design.* 179p. Order Number DE95755095. Source: OSTI; NTIS.

The German Ministry for Research and Technology (BMFT) has started the 250 MW-Wind Programme in 1989, which today offers a reward of 0,06 DM to private or commercial operators of a wind energy converter for every KWh fed into the public grid. The programme is combined with an obligation of the owner to participate in the Scientific Measurement and Evaluation Programme(WMEP) carried out by ISET. The WMEP has the main goal to support and accelerate the scientific and industrial progress by making maximum use of the experience with wind power application. Therefore, the WMEP has to establish and to operate of monitoring programme with the following goals: During a long observation period (10 years) initial as well as long term effects of operation shall be recorded and evaluated. Operational conditions and results of types and classes of wind converters shall be evaluated on a broad statistical basis. The effects of wind power integrated in public grids on a larger scale shall be observed and evaluated. The economic conditions together with product qualification shall be evaluated and on-line measurement system for the direct observation of operation of wind converters together with speed measurements on site with high resolution established. (EG)

9916 (NEI-DK–1869, pp. 73-86) **Measured and simulated turbulence. Compared at a section of a rotating wind turbine blade.** Thirstrup Petersen, J. (Risoe National Laboratory, The Test Station for Wind Turbines, Roskilde (Denmark)); Aagaard Madsen, H.; Kretz, A. Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9406223–: International Energy Agency meeting on wind conditions for wind turbine design, Hamburg (Germany), 27-28 Jun 1994). In *IEA joint action. Wind conditions for wind turbine design.* 179p. Order Number DE95755095. Source: OSTI; NTIS.

Models for prediction of wind turbine response are to a wide extent based on time simulation, and it is common practice to use a stochastically generated, synthetic turbulent wind field as input to the calculation of loading on the structure. The present paper summarizes recently performed work concerned with investigation of the quality of such generated synthetic turbulence by comparing it with measured turbulence, represented as the local wind vector at a cross section of a rotating wind turbine glade in natural wind. This procedure has the great advantage that the important spatial structure of the turbulence is tested for through the comparison of the rotationally sampled wind vector. The comparison is extended to cover the normal force on a blade segment. In particular, the importance of including the transversal turbulence components is addressed. A recently developed simulation method, which includes all three turbulence components, shows excellent agreement with the measurements and is superior to a model, which includes only the longitudinal component. It is demonstrated that inclusion of all three components is important for the simulation of the local wind vector, represented in the present context as the relative velocity and the angle of attack. The model, which includes only the longitudinal component, gives rise to underestimation of the relative velocity variations and overestimation of the angle of attack variations originating from turbulence. In order to demonstrate the effect of these discrepancies on the resulting force on the blade segment, the force is derived in a simplified way by use of linearized normal force coefficient curves. The actual influence of the discrepancies depends on the slope of the coefficient curve. Rainflow counting and estimation of fatigue damage show that the transversal components in general are of great importance of the prediction of fatigue. (Abstract Truncated)

9917 (NEI-DK–1869, pp. 87-92) **Extreme loads on blades of a stall turbine following: the Dutch Technical Criteria - the Germanischer LLoyd - the IEC norm, including extra calculations with dynamic stall and unfavorable airfoil data.** Viser, B. (Stork Product Engineering, Amsterdam (Netherlands)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9406223–: International Energy Agency meeting on wind conditions for wind turbine design, Hamburg (Germany), 27-28 Jun 1994). In *IEA joint action. Wind conditions for wind turbine design.* 179p. Order Number DE95755095. Source: OSTI; NTIS.

To support the discussion on the design loads, different design norms (Dutch Technical Criteria, Germanischer Lloyd and IEC norm) are applied to calculate the extreme blade loads of a stall turbine. Besides the influence of dynamic stall and unfavorable airfoil data is calculated. Comparison between the calculations and the experience in the field can contribute to get the best from each code and obtain a more explicit definition of the future IEC code. (au)

9918 (NEI-DK–1869, pp. 93-98) **On the increment of the fatigue damage on wind turbines in wind farms.** Soerensen, P.

(Risoe National Laboratory, Test Station for Wind Turbines, Roskilde (Denmark)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9406223–: International Energy Agency meeting on wind conditions for wind turbine design, Hamburg (Germany), 27-28 Jun 1994). In *IEA joint action. Wind conditions for wind turbine design.* 179p. Order Number DE95755095. Source: OSTI; NTIS.

Risoe has measured wind and loads in several wind farms. Especially the measurements in Noerrekaer Enge are interesting because a statistical database has been established. The database consists of online calculations of 30 minutes mean values, standard deviations, maxima, minima, and equivalent widths from Rainflow Countings. A similar database is now built from the measurements in the offshore wind farm in Vindeby. (au)

9919 (NEI-DK–1869, pp. 99-106) **Review of the effect of IEC design cases on the design of the WEG MS3.** Gilkes, S. (Wind Energy Group, London (United Kingdom)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9406223–: International Energy Agency meeting on wind conditions for wind turbine design, Hamburg (Germany), 27-28 Jun 1994). In *IEA joint action. Wind conditions for wind turbine design.* 179p. Order Number DE95755095. Source: OSTI; NTIS.

The MS3 is a two bladed, teetered and pitch regulated 300 kW turbine. It was originally designed as part of the U.K. wind energy programme. Specific sites had been identified for initial use but a general specification was adopted assuming a 8.5 m/s Rayleigh distributed wind speed on a moderate upland site in England or Wales. The teetered design ensured that loads were relatively insensitive to the details of the wind conditions, particularly in terms of yaw errors and wind shears except in extreme circumstances. The design loads are based on (1) deterministic calculation of extreme operational and non-operational loads using knowledge gained in LS1 wind studies and MS3 prototype operation. (2) Monitored fatigue load data using high intensity and low integral length turbulence cases and backed up with data from the Cemmaes site. This brief paper reviews some aspects of the design in the light of the IEC draft code and then comments on the codes assumption in relation to that of the windfarms on which MS3s are sited. The MS3 has now been superseded by the WEG 400, which was designed during the period in which the IEC code was drafted. (au)

9920 (NEI-DK–1869, pp. 107-113) **Critical analysis of wind conditions prescribed by the IEC-DIS 1400-1.** Stork, C.H.J. (Riva Calzoni SpA, Bologna (Italy)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9406223–: International Energy Agency meeting on wind conditions for wind turbine design, Hamburg (Germany), 27-28 Jun 1994). In *IEA joint action. Wind conditions for wind turbine design.* 179p. Order Number DE95755095. Source: OSTI; NTIS.

The present document compares actual wind conditions with those prescribed by the IEC-DIS. In particular the measured records of 2 extreme deterministic wind conditions, a gust and a wind direction change, will be analysed. Furthermore a first step for a method, which connects the IEC-DIS standard deviation definition to the one of actual sites, is given. With this method it is possible to verify whether the standard classes can cover most of the potential sites without requiring an over-dimensioning of the WTGS. (au)

9921 (NEI-DK–1869, pp. 115-118) **Swing - stochastic wind generator.** Bierbooms, W. (Delft University of Technology, Institute for Wind Energy, Delft (Netherlands)); Dragt, J.B. Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9406223–: International Energy Agency meeting on wind conditions for wind turbine design, Hamburg (Germany), 27-28 Jun 1994). In *IEA joint action. Wind conditions for wind turbine design.* 179p. Order Number DE95755095. Source: OSTI; NTIS.

For design load calculations for wind turbines it is beginning to become practice to use stochastic turbulence models instead of some deterministic wind gusts. For the stochastic turbulence models one has the choice between several power spectral density functions and coherency functions describing the stochastic properties of the turbulent wind. In this paper the consequences of this choice will be investigated, but first the computer package SWING will be dealt with. (au)

9922 (NEI-DK–1869, pp. 149-153) **Wind conditions in complex terrain.** Tammelin, B. (Finnish Meteorological Institute, Helsinki (Finland)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9406223–: International Energy Agency meeting on wind conditions for wind turbine design, Hamburg (Germany), 27-28 Jun 1994). In *IEA joint action. Wind conditions for wind turbine design.* 179p. Order Number DE95755095. Source: OSTI; NTIS.

Due to the siting and type of anemometers the meteorological wind measurements typically under estimate the areal maximum wind speeds. In cold climate also frost and ice on the gauges cause too low values. It is also difficult to use the ordinary synoptic data to calculate the wind conditions at the nearby hill areas. High wind speeds together with high turbulence intensity causes many problems for wind energy production and WECS. On coastal areas the turbulence intensity can be 0.3-0.4 or even more. High turbulence causes new needs for planning and construction. (au)

9923 (NEI-DK–1871) **Use of wind power in the Arctic regions - a demonstration project in Greenland. Final report.** Lundsager, P. (Darup Associates ApS (Denmark)); Lemgart, M.-L.; Ahm, P.; Bindner, H. Darup Associates ApS, Roskilde (Denmark). Feb 1995. 102p. (In Danish). Contract ENS-51171-94.0012. Order Number DE95755117. Source: OSTI; NTIS.

This report constitutes the documentation for the Energy agency and Nukissiorfiit concerning the project 'Use of wind power in the Arctic regions'. The project was initiated in April 1994 in order to evaluate the possibilities of wind power contribution into the power supply system in Greenland. One or several demonstration projects were to be established and Arctic modifications of the standard wind turbine equipment were to be tested. The project was carried out in two phases: the first one was a design-bench study, based on information from Nukissiorfiit concerning the existing electric power supply in the settlements, and on Risoe wind resource knowledge. The second phase is based on information collection in Greenland concerning the potential sites, with Nanortarlik as the primary choice and Sisimiut as the secondary one. (EG)

9924 (NREL/TP–441-7223) **Performance of a stand-alone wind-electric ice maker for remote villages.** Davis, H.C. (National Renewable Energy Lab., Golden, CO (United States)); Brandemuehl, M.J.; Bergey, M.L.S. National Renewable Energy Lab., Golden, CO (United States). Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-950116–5: 1995 American Society of Mechanical Engineers (ASME) energy sources technology conference and exhibition, Houston, TX (United States), 29 Jan - 1 feb 1995). Order Number DE95004006. Source: OSTI; NTIS; GPO Dep.

Two ice makers in the 1.1 metric tons per 24 hours (1.2 tons per day) size range were tested to determine their performance when directly coupled to a variable-frequency wind turbine generator. Initial tests were conducted using a dynamometer to simulate to wind to evaluate whether previously determined potential problems were significant and to define basic performance parameters. Field testing in Norman, Oklahoma, was completed to determine the performance of one of the ice makers under real wind conditions. As expected, the ice makers produced more ice at a higher speed than rated, and less ice at a lower speed. Due to the large start-up torque requirement of reciprocating compressors, the ice making system experienced a large start-up current and corresponding voltage drop which required a larger wind turbine that expected to provide the necessary current and voltage. Performance curves for ice production and power consumption are presented. A spreadsheet model was constructed to predict ice production at a user-defined site given the wind conditions for that location. Future work should include long-term performance tests and research on reducing the large start-up currents the system experiences when first coming on line.

9925 (RISO-R–795(DA)) **Selected results from the aerodynamic research programme at The Test Station for Wind turbines in the period 1987-1992.** Aagaard Madsen, H.; Rasmussen, F. Risoe National Lab., Roskilde (Denmark). Test Station for Wind Turbines. Jan 1995. 59p. (In Danish). Contract ENS-1364/92-0001; Contract ENS-1364/91-0001; Contract E Order

EFP-92; EFP-91; EFP-90; EFP-89; EFP-88.

This report summarizes the main results achieved within the aerodynamic research work at the Test Station for Wind Turbines during the five years period from 1987 to 1992. The objective has been to present the material in a compact form but with references to the original reports and conference proceedings. During this period the research work has been funded mainly by contracts with the Danish Ministry of Energy under the programme 'Energiforskningsprogram EFP'. However, a considerable contribution to funding has also been achieved from research contracts with the European Community. (au) (1 tab., 47 ills., 20 refs.)

9926 (SAND–94-2460) **User's manual for FAROW: Fatigue and reliability of wind turbine components: Version 1.1.** Veers, P.S. (Sandia National Labs., Albuquerque, NM (United States)); Winterstein, S.R.; Lange, C.H.; Wilson, T.A. Sandia National Labs., Albuquerque, NM (United States). Nov 1994. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95005530. Source: OSTI; NTIS; GPO Dep.

FAROW is a Computer program that assists in the probabilistic analysis of the Fatigue and Reliability of wind turbines. The fatigue lifetime of wind turbine components is calculated using functional forms for important input quantities. Parameters of these functions are defined in an input file as either constants or random variables. The user can select from a library of random variable distribution functions. FAROW uses structural reliability techniques to calculate the mean time to failure, probability of failure before a target lifetime, relative importance of each of the random inputs, and the sensitivity of the reliability to all input parameters. Monte Carlo simulation is also available. This user's manual is intended to provide sufficient information to knowledgeably run the program and meaningfully interpret the results. The first chapter provides an overview of the approach and the results. Chapter 2 describes the formulation and assumptions used in the fatigue life calculations. Each of the input parameters is described in detail in Chapter 3 along with hints and warnings on usage. An explanation of the outputs is provided in Chapter 4. Two example problems are described and solved in Chapter 5, one for the case where extensive data are available and the other with limited data where the uncertainty is higher. A typical input file and the output files for the example problems are included in the appendices.

9927 (CONF-9409219–2) **Partitioning of solutes between liquid water and steam in the system {Na-NH_4-NH_3-H-Cl} to 350°C.** Simonson, J.M. (Oak Ridge National Lab., TN (United States). Chemical and Analytical Sciences Div.); Palmer, D.A. Oak Ridge National Lab., TN (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States). DOE Contract AC05-84OR21400. From Conference on properties of water and steam; Orlando, FL (United States); 12 Sep 1994. Order Number DE95006735. Source: OSTI; NTIS; GPO Dep.

Measurements have been made of the partitioning of solutes between liquid and vapor phases for hydrochloric acid and chloride salts found in both power plant steam cycles and in natural geothermal systems. Static sampling of equilibrium liquid and vapor phases extended from 350 C to the lowest temperatures for which reliable analytical determinations of vapor-phase solute concentrations could be made. Equilibrium constants for the partitioning of the various solutes were calculated from the measured equilibrium compositions, and represented as functions of temperature and solvent density over the full temperature range investigated. These equilibrium constants can be used to calculate equilibrium compositions of coexisting liquid and vapor phases under conditions ranging from steam production from saline geothermal brines to early-condensate formation in all-volatile treatment steam cycles.

9928 (DOE/MC/27363–95/C0406) **Polk power station syngas cooling system.** Jenkins, S.D. Tampa Electric Co., FL (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-91MC27363. (CONF-9410284–: 11. worldwide Texaco gasification licensee symposium, White Plains, NY (United States), 10-13 Oct 1994). Order Number DE95005015. Source: OSTI; NTIS; GPO Dep.

Tampa Electric Company (TEC) is in the site development and construction phase of the new Polk Power Station Unit No. 1. This will be the first unit at a new site and will use Integrated Gasification Combined Cycle (IGCC) Technology. The unit will utilize Texaco's oxygen-blown, entrained-flow coal gasification, along with combined cycle power generation, to produce nominal 260MW. Integral to the gasification process is the syngas cooling system. The design, integration, fabrication, transportation, and erection of this equipment have provided and continue to provide major challenges for this project.

This work details the responsibilities of several contractors in the construction of a coal-fired power plant. The subcontractor bidding process is discussed in detail.

9932 (DOE/MC/29257–3932) **Advanced turbine systems program conceptual design and product development. Quarterly report, May–July 1994.** USDOE Morgantown Energy Technology Center, WV (United States). Oct 1994. 15p. Sponsored

by USDOE, Washington, DC (United States). DOE Contract AC21-93MC29257. Order Number DE95000025. Source: OSTI; NTIS; GPO Dep.

This quarter of the ATS program saw progress occur in several areas; An update (Revision A) of the Management Plan was submitted on May 15, 1994. This Plan was updated to reflect two basic changes to the program; 1. Task 8.5 was stopped and remaining funds transferred to the Task 8.IT, the test of the ATS 2600F prototype turbine. 2. Task 8.1B was added to the program. This task is the Build/Teardown of the prototype 260OF turbine. This task is fully funded by Allison and is in-kind cost share replacing cost share lost due to decreases on Allisons overhead rates. It is noted that these changes do not affect either the total value of the program or Allisons 25% cost share. Allison has submitted justification for 2. above. DoE has requested a cost to complete on the program. This is in process and will be completed in August 1994.

9933 (DOE/MC/29257–3959) **Advanced Turbine Systems program conceptual design and product development. Quarterly report, August–October 1994.** Allison Engine Co., Indianapolis, IN (United States). Jan 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC29257. Order Number DE95000050. Source: OSTI; NTIS; GPO Dep.

This report addresses progress on Advanced Turbine Systems (ATS) design and testing. The most important program milestone to date occurred during this quarter. Allison successfully tested the prototype ATS high temperature turbine section to the ATS goal of 2600F Turbine Rotor Inlet Temperature. This test represented the first full engine test of the Castcool turbine airfoil cooling system. This contract provided funding for the build and test of the turbine system while other Allison IR and D funding and Navy contract funds provided the design and development successes necessary to advance this technology to the level required for a successful test. A demonstration of this kind shows what a cooperative government/industry initiative can achieve. This test itself was cut short due to a high interstage cavity temperature resulting in remaining budget at completion of test. Allison has decided that the best use of the remaining budget is to develop the manufacturing process for Castcool turbine rotor blades now that the process for the stator vanes has been proven. Development of this process will provide the basis for future engine development of this critical ATS high temperature turbine technology. DOE COR Diane Hooie agreed with this direction and Allison will proceed down this path posthaste. Allison is in the process of requesting a contract extension. Although most tasks will be completed by end of contract there are two areas where additional time is needed: (1) dynamic oxidation testing – obtaining the goal of 5,000hrs will require an additional 2 months; (2) combustor rig testing of the "best" lean pre-mix module will require an additional one month. Addition time will be required to accomplish the reporting task for these efforts.

9934 (DOE/MC/30247–3950) **Advanced Turbine Systems Program conceptual design and product development. Annual report, August 1993–July 1994.** Westinghouse Electric Corp., Orlando, FL (United States). Power Generation Business Unit. Nov 1994. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30247. Order Number DE95000041. Source: OSTI; NTIS; GPO Dep.

The stated objective of the project was to analyze and evaluate different cycles for the natural gas-fired Advanced Turbine Systems (GFATS) in order to select one that would achieve all of the ATS Program goals. Detailed cycle performance, cost of electricity, and RAM analysis were carried out to provide information on the final selection of the GFATS cycle. To achieve the very challenging goals, innovative approaches and technological advances are required, especially in combustion, aerodynamic design, cooling design, mechanical design, leakage control, materials, and coating technologies.

9935 (DOE/METC/C–95/7165) **Small-scale AFBC-hot air gas turbine power cycle.** Ashworth, R.C. (Energy and Environmental Research Corp., Orrville, OH (United States)); Keener, H.M.; Hall, A.W. USDOE Morgantown Energy Technology Center, WV (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). (CONF-9405283–1: 13. international fluidized-bed combustion conference, Orlando, FL (United States), 7-10 May 1994). Order Number DE95006700. Source: OSTI; NTIS; GPO Dep.

The Energy and Environmental Research Corporation (EER), the Ohio Agricultural Research and Development Center (OARDC), the Will-Burt Company (W-B) and the U.S. Department of Energy (DOE) have successfully developed and completed pilot plant tests on a small scale atmospheric fluidized bed combustion (AFBC) system. This system can be used to generate electricity, and/or hot water, steam. Following successful pilot plant operation, commercial demonstration will take place at Cedar Lane Farms (CLF), near Wooster, Ohio. The system demonstration will be completed by the end of 1995. The project is being funded through a cooperative effort between the DOE, EER, W-B, OARDC, CLF and the Ohio Coal Development Office (OCDO). The small scale AFBC, has no internal heat transfer surfaces in the fluid bed proper. Combining the combustor with a hot air gas turbine (HAGT) for electrical power generation, can give a relatively high overall system thermal efficiency. Using a novel method of recovering waste heat from the gas turbine, a gross heat rate of 13,500 Btu/kWhr (~25% efficiency) can be achieved for a small 1.5 MW, plant. A low technology industrial recuperation type gas turbine is used that operates with an inlet blade temperature of 1450°F and a compression ratio of 3.9:1. The AFBC-HAGT technology can be used to generate power for remote rural communities to replace diesel generators, or can be used for small industrial co-generation applications.

9936 (DOE/PC/91155–T8) **Coal-fired high performance power generating system. Quarterly progress report, April 1, 1994–June 30, 1994.** United Technologies Corp., East Hartford, CT (United States). Research Center. [1995]. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC91155. Order Number DE95006663. Source: OSTI; NTIS; GPO Dep.

The goals of the program are to develop a coal-fired high performance power generation system (HIPPS) by the year 2000 that is capable of: (1) > 47% thermal efficiency; (2) NO_x, SO_x and particulates $\leq$25% NSPS; (3) cost $\geq$ 65% of heat input; (4) all solid wastes benign. In order to achieve these goals, this team has outlined a research plan based on an optimized analysis of a 250 MW_e combined cycle system applicable to both frame type and aeroderivative gas turbines. Under the constraints of the cycle analysis the authors have designed a high temperature advanced furnace (HITAF) which integrates several combustor and air heater designs with appropriate ash management procedures. The efforts in Task 3.1.1 have focused on an evaluation of the various in-furnace NO_x control strategies including SNCR. Experimental work on gas stabilization, air staging, reburning and optimized SNCR are presented here. By judicious combinations of all these approaches, the model predicts that the NO, goal of 0.06 lbs NO_x/MBTU fuel can be met. This combination of experimental and analytical approaches provides the best perspective for a cost effective evaluation of all the NO_x control strategies, including SCR. Under Task 3.1.2, work has been progressing on the design of the slag screen. The design analysis has been improved to account for tube placement and tube roughness. This latter parameter has been varied to include effects of deposit formation. Pressure drop, heat loss and screen efficiency can now be optimized. The changes in the designs of both the radiant and convective air heaters has resulted in a new appraisal of potential material requirements. This work being carried out under Task 3.1.3 has focused on high-strength cast superalloys for strength and an array of alloy and ceramic materials for corrosion-resistant coatings. An outline of the work to be performed under Task 3.1.7 Combustor Controls completes this report.

9937 (DOE/PC/92160–T7) **Engineering development of advanced coal-fired low-emission boiler systems. Quarterly technical progress report, April 1, 1994–June 30, 1994.** Babcock and Wilcox Co., Alliance, OH (United States). 3 Nov 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92160. Order Number DE95006670. Source: OSTI; NTIS; GPO Dep.

This work is directed toward the design of a coal-fired boiler with reduced emissions. Administrative and technical advancements in the recent period are reported here. Progress in the selection of

various components of the boiler as well as testing and modeling of system components is detailed.

9938 (DOE/PC/94110–T2) **Advanced technologies - engineering and design. Technical progress report No. 1, July 1994–September 1994.** TECOGEN, Inc., Waltham, MA (United States). 28 Sep 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94PC94110. Order Number DE95006941. Source: OSTI; NTIS; GPO Dep.

During the second reporting period, the design of the system modifications was continued and significant progress was made in completing the detailed designs. The design shows that a system efficiency of 86.69 percent based on the higher heating value is possible. Obtaining this efficiency provides the project with its first design success. During the next reporting period, the design will be continued and is projected to be completed.

9939 (LUTMDN-TMVK–5240) **Evaluation of gas-fueled small-scale cogeneration.** Sarbrant, H. Lund Univ. (Sweden). Dept. of Heat and Power Engineering. Oct 1994. 63p. (In Swedish). Order Number DE95745004. Source: OSTI; NTIS.

Examination paper.

The interest for cogeneration of heat and electric power in small natural gas fired plants is growing in Sweden as the time for phase-out of nuclear power is approaching. Existing plants in Sweden are only of pilot or demonstration character, with high generating costs. This study describes how swedish plants (gas engines, gas turbines, or fuel cells) could perform regarding technology, economy and environment. Comparisons are made with Denmark, where profitable commercial plants already exist. Experiences from the existing plants of the Swedish utility Sydkraft are briefly reviewed. 15 refs. 34 figs

9940 (DOE/PC/90550–T14) **Integrated dry NO_x/SO_2 emissions control system calcium-based dry sorbent injection. Test report, April 30–November 2, 1993.** Shiomoto, G.H. (Fossil Energy Research Corp., Laguna Hills, CA (United States)); Smith, R.A.; Muzio, L.J.; Hunt, T. Fossil Energy Research Corp., Laguna Hills, CA (United States); Public Service Co. of Colorado, Denver, CO (United States). Dec 1994. 122p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-91PC90550. Order Number DE95007932. Source: OSTI; NTIS; GPO Dep.

The DOE sponsored Integrated Dry NO_xSO_2 Emissions Control System program, which is a Clean Coal Technology III demonstration, is being conducted by Public Service Company of Colorado. The test site is Arapahoe Generating Station Unit 4, which is a 100 MWe, down-fired utility boiler burning a low sulfur Western coal. The project goal is to demonstrate up to 70 percent reductions in NO_x and SO_2 emissions through the integration of: (1) down-fired low-NO_x burners with overfire air; (2) Selective Non-Catalytic Reduction (SNCR) for additional NO_x removal; and (3) dry sorbent injection and duct humidification for SO_2 removal. The effectiveness of the integrated system on a high-sulfur coal will also be investigated. This report documents the fifth phase of the test program, where the performance of the dry sorbent injection of calcium was evaluated as an SO_2 removal technique. Dry sorbent injection with humidification was performed downstream of the air heater (in-duct). Calcium injection before the economizer was also investigated. The in-duct calcium sorbent and humidification retrofit resulted in SO_2 reductions of 28 to 40 percent, with a Ca/S of 2, and a 25 to 30°F approach to adiabatic saturation temperature. The results of the economizer calcium injection tests were disappointing with less than 10 percent SO_2 removal at a Ca/S of 2. Poor sorbent distribution due to limited access into the injection cavity was partially responsible for the low overall removals. However, even in areas of high sorbent concentration (local Ca/S ratios of approximately 6), SO_2 removals were limited to 30 percent. It is suspected that other factors (sorbent properties and limited residence times) also contributed to the poor performance.

9941 (DOE/PC/93214–T5) **Separation of flue-gas scrubber sludge into marketable products. Second year, first quarterly technical progress report, September 1, 1994–November 30, 1994 (Quarter #5).** Kawatra, S.K.; Eisele, T.C.; Shoop, K. Michigan Technological Univ., Houghton, MI (United States). Dept. of Metallurgical and Materials Engineering. Sep 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93214. Order Number DE95007661. Source: OSTI; NTIS; GPO Dep.

To reduce their sulfur emissions, many coal-fired electric power plants use wet flue-gas scrubbers. These scrubbers convert sulfur oxides into solid sulfate and sulfite sludge, which must then be disposed of. This project is studying the characteristics of flue-gas scrubber sludges from several sources, which is necessary for the development of purification technologies which will make it possible to directly utilize scrubber sludges rather than landfilling them. The objectives of this project are to: (1) investigate properties of scrubber sludge that will control its behavior in separation processes, and determine how the surface properties of the sludge particles change as the conditions in the solution change; (2) examine the ability of various froth-flotation processes to separate the various components based on differences in their surface chemistry; and (3) determine methods for accomplishing the separation without adding additional chemical hazards to the environment. In the fifth quarter, studies of the zeta potentials of the individual sludge components were continued. These measurements were initially being made on chemically pure calcium sulfite, calcium carbonate, and gypsum, to establish a baseline for comparison for the actual sludge samples. These measurements are being used to determine the solution conditions that produce the greatest differences in the surface properties of the various types of particles in the sludge, and which will therefore produce the sharpest possible flotation separation. In addition to determining the point of zero charge for the pure components of the scrubber sludge, sample preparation continued. The three scrubber sludges that were mentioned in the first quarterly report were split into smaller samples so they could more easily be used in laboratory work. The details of these studies are presented in the following sections.

9942 (DOE/PC/93256–T8) **Electric Power Research Institute, Environmental Control Technology Center report to the Steering Committee, October 1994.** Electric Power Research Inst., Palo Alto, CA (United States). Oct 1994. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94PC93256. Order Number DE95006202. Source: OSTI; NTIS; GPO Dep.

Operations and maintenance continued this month at the Electric Power Research Institute's Environmental Control Technology Center. Testing on the 4.0 MW Pilot Wet FGD unit continued this month with the Pilot Trace Element test block. On the Cold-Side Selective Catalytic Reduction (SCR) unit, testing continued this month as ammonia slip measurements were conducted at baseline and low temperature conditions. Additionally, single side reactor tests were conducted as the individual catalyst beds were isolated. The Pilot Trace Elements Test Block (PTET) continued in October as part of EPRI's overall program for developing control technology options for trace element emissions, should such technologies be required by future regulations. The objective of the PTET test block is to ascertain how well wet flue gas desulfurization systems control trace element emissions from coal-fired power plants. A scheduled outage at the NYSEG Kintigh station caused the ECTC to come off-line between October 7 and October 10. Numerous O and M activities were completed during the outage dates. The specific activities are detailed in the respective sections of the report.

9943 (DOE/PC/94117–T1) **Micronized coal-fired retrofit system for SO_x reduction: Krakow Clean Fossil Fuels and Energy Efficiency Program. Technical progress report No. 1, [April–June 1994].** TCS, Inc., Oakland, MD (United States). Sep 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94PC94117. Order Number DE95005172. Source: OSTI; NTIS; GPO Dep.

Objective of the project is to retrofit the Balice Boilerhouse with a TCS Coal Micronization System and Amerex baghouses to achieve higher combustion efficiencies and lower air emissions, including

SO_2, NO_x, CO and particulate matter. The Balice Boilerhouse is located adjacent to the Krakow Airport and provides heating steam for the Polish Military Unit No. 1616, which is based in the vicinity of the Krakow airport. Progress is described.

9944 (ETDE-DE–13) **Experience with labyrinth separators for fly ash separation in power plants. Final report.** Thielen, W.; Graf, D. Steinmueller (L.u.C.) GmbH, Gummersbach (Germany); Ingenieurunternehmen fuer Kraftwerks-, Energie- und Umwelttechnik (IfK), Vetschau (Germany). Dec 1992. 29p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0326722A. Order Number DE95746709. Source: OSTI; NTIS (US Sales Only).

Particle separation systems presently used in power plants, e.g. cyclones, electrostatic precipitators or fabric filters etc., can nowadays be safely operated but have the disadvantage of high energy consumption. The pressure drop through separators in labyrinth construction is low compared therewith. Such separators can therefore well be retrofitted in existing power stations without any rating restriction being involved therein. In order to allow for the use of labyrinth separators with varying flue gas velocities and solids concentrations, the separation process andthe mechanisms involved therein have been optimised for various separator positions. These mechanisms are primary separation by deposition of particles in a catchment pocket, their discharge within the pocket and the dust removal from the system. At present, labyrinth separators are often installed toreduce erosion. By the separation of the coarse grain fraction, wear in downstream plant components can demonstrably be reduced and the plant availability serve the purpose of relieving multicyclones and reducing the content of contaminated solids in flue gas cleaning plants. 9945 (PNL-SA–25520) **Energy and environmental efficiency in competitive power markets.** Warwick, W.M. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950223–1: 3. biennial energy efficiency and the global environment conference: industrial competitiveness and sustainability, Newport Beach, CA (United States), 8-9 Feb 1995). Order Number DE95007271. Source: OSTI; NTIS; INIS; GPO Dep.

For years the electric utility industry operated as a regulated monopoly, largely immune to market forces except those of competing fuels. That era came to an end with the Public Utilities Regulatory Policy Act (PURPA) of 1974, which created a market for non-utility generated power. Within twenty years, non-regulated, non-utility generators had become the primary supplier of new energy resources. Their market power is matched by their political power, as evidenced in the Energy Policy Act of 1994 (EPAct), which requires open access to utility transmission lines to facilitate inter-utility bulk power sales. The conventional wisdom is that active wholesale power markets with competition among alternative generators will lead to lower power-development costs and cheaper retail power prices. The trend towards alternative bulk power sources at low prices intersects with large retail power customers' interest in accessing alternative power supplies. In most cases, these alternatives to local utilities are at a lower cost than retail rates. For the most part, proponents of generation competition have remained silent about potential environmental consequences. However, skeptics of increased competition, including major environmental groups, cite environmental impacts among their concerns. This report examines these concerns.

Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

The in-core fuel management task performed by a core design engineer at a nuclear utility and/or fuel vendor consists of several sub tasks, central to which is creating a loading pattern. Usually, at this stage the length of the power-production period is fixed, as well as enrichment of the available fresh fuel and burnable poison designs. Thus, the basic task of the core design engineer is to create a pattern (configuration) of available fuel assemblies for a given core and under a set of constraints. Accumulated experience plays an important role in the process of generating a reload pattern; it starts usually by choosing an initial, 'reasonable' pattern. The whole process is then carried out as a series of trial and error attempts to improve the initial pattern by local modification. This description of the process is such that its real nature remains somewhat obscure. Let us consider an alternative representation of the process as the following sequence of operations, an algorithm, designed to create a reload pattern under a set of constraints. (author). 4 figs.

9947 (NUREG–0020-Vol.16) **Licensed operating reactors: Status summary report data as of December 31, 1991. Volume 16.** Nuclear Regulatory Commission, Washington, DC (United States). Office of Information Resources Management. Mar 1992. 339p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS.

The Nuclear Regulatory Commission's annual summary of licensed nuclear power reactor data is based primarily on the report of operating data submitted by licensees for each unit for the month of December because that report contains data for the month of December, the year to date (in this case calendar year 1991) and cumulative data, usually from the date of commercial operation. The data is not independently verified, but various computer checks are made. The report is divided into two sections. The first contains summary highlights and the second contains data on each individual unit in commercial operation. Section 1 capacity and availability factors are simple arithmetic averages. Section 2 items in the cumulative column are generally as reported by the licensee and notes as to the use of weighted averages and starting dates other than commercial operation are provided.

The next generation of commercial nuclear power reactors is characterized by a new approach to achieving reliability of their safety systems. In contrast to current generation reactors, these designs apply passive safety features that rely on gravity-driven

transfer processes or stored energy, such as gas-pressurized accumulators or electric batteries. This paper discusses the passive safety system of the AP600 and Simplified Boiling Water Reactor (SBWR) designs.

The objective of long-term control rod programming is to develop a sequence of exposure-dependent control rod patterns that assure the safe and efficient depletion of the nuclear fuel for the duration of the cycle. A two step method was effected in the code OCTOPUS to perform this task automatically for the Pennsylvania and Power Light Co.' BWRs. Although the execution of OCTOPUS provides good or satisfactory results, its input and execution mode has been improved by making it more user friendly and automatic. (authors).

The contents and the quality of the evaluated nuclear data files for conventional BWRs, PWRs and FBRs have been significantly improved in past 30 years. It seemed the fields of nuclear data activities have shifted to charged particles and higher energy regions. In this report, some situations are discussed on the nuclear data for fission reactors, the advanced reactors and TRU burners. In order to avoid confusion and the loss of labor in preparing the multigroup cross section sets for reactor physics and core design, the intensive benchmark tests of JENDLE-3,2 have to be made before the release. TRU burners require more new data especially related to higher actinide and charged particle-induced reactions. Continuous Monte Carlo method can reduce in general the methodological uncertainty for some properties like effective multiplication factor, but due to the statistical limitation, the overall accuracy is limited. More active approach to nuclear data evaluation is desirable, and "Nuclear data application working group" is an idea. The goals of nuclear data evaluation and measurement are the satisfactory accuracy of existing evaluated nuclear data and the nuclear data for unknown nuclei. (K.I.).

9952 (NUREG/CR–6226) **Effect of dynamic strain aging on the strength and toughness of nuclear ferritic piping at LWR temperatures.** Marschall, C.W. (Battelle, Columbus, OH (United States)); Mohan, R.; Krishnaswamy, P.; Wilkowski, G.M. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Battelle, Columbus, OH (United States). Oct 1994. 97p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (BMI–2176). Source: OSTI; NTIS; INIS; GPO.

This topical report is on the phenomenon of dynamic strain aging (DSA) in ferritic nuclear piping steels and its effect on fracture at LWR temperatures. The report was a deliverable from the US NRC's program entitled "Short Cracks in Piping and Piping Welds". The objective of this work was to predict the occurrence of and evaluate the effects of ductile crack instabilities, which occur frequently in ferritic steel pipe fracture tests at 288 C (550 F), and are believed to be due to dynamic stain aging. Numerous laboratory tests and one numerical simulation of a C(T) test with crack instabilities were undertaken.

9953 (PNL-SA–21636) **Simulation of NPLWR environment in the ATR Loop-1 test.** Hollenberg, G.W. (Pacific Northwest Lab., Richland, WA (United States)); McKee, R.S.; O'Connor, R.R.; Thielges, J.R.; Spencer, D.R. Pacific Northwest Lab., Richland, WA (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9408206–1: 6. international symposium on environmental degradation of material in nuclear power system, San Diego, CA (United States), 1-5 Aug 1994). Order Number DE95004934. Source: OSTI; NTIS (US Sales Only); GPO Dep.

An irradiation test of high-temperature, light water reactor, tritium targets was conducted in the ATR that simulated the neutronic, thermal-hydraulic and chemical conditions in an NPLWR for the production of tritium. Requirements for water chemistry, temperature, pressure, spectrum and fluence were met for essentially all of the 217 days of irradiation. The loop test facilities in the ATR provide excellent capabilities for conducting long term, well controlled, in situ tests to simulate degradation of the materials, components and systems used in LWR's and should be considered for testing other components.

9954 (SKI-R–94-21) **Safety and radiation protection at the swedish nuclear power plants 1993-94.** Swedish Nuclear Power Inspectorate, Stockholm (Sweden); Swedish Radiation Protection Inst., Stockholm (Sweden). Nov 1994. 26p. (In Swedish). (SSI–94-09.). Order Number DE95620378. Source: OSTI; NTIS; INIS.

Operational experiences from the fiscal year 1993/94 and safety analyses of the 12 swedish power reactors (9 BWRs and 3 PWRs) are reviewed in this report. The availability of the reactors has been high, except for three of the oldest reactors, which underwent major repair and renovation work. The occupational collective radiation dose amounted to 2.8 manSv per installed GW electric power, which is markedly above the target level of 2 manSv set by the Radiation Protection Institute. More than 70 percent of this dose originated in the repair of the old BWRs. Seven events of safety interest are reported, six of which have been classified as level 1 incidents on the INES-scale. 6 figs.

The author presents a brief description of NUREG-1150 and NUREG-0956, both documents of great importance in the risk area. Based on document's recommendations and following NUREG-1150 similar methodology, a calculation model is proposed

in this publication, with the purpose of analyzing the consequences of a severe accident in Angra-I Power Station. The suggested model can be divided in two stages: the first one called front-end considers the power station system safety during the accident, and the second called back-end cares for accident consequences. 9 refs. (B.C.A.).

9956 (DES–176) **Ways of improving safety for future PWRs in France.** Gros, G.; Jalouneix, J.; Manesse, D.; Mattei, J.M. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire. Jun 1994. 10p. (CONF-940402–: International topical meeting on the safety of advanced reactors, Pittsburgh, PA (United States), 18-20 Apr 1994). Order Number DE95618782. Source: OSTI; NTIS (US Sales Only); INIS.

Results of thinkings and studies, conducted within the Institute for Nuclear Safety and Protection (IPSN) on various fields of nuclear power plant safety, on the definition of safety objectives and principles for future PWRs. The aim of the studies is to identify ways of improving the design of future plants in France and Germany, with the main following objectives: significant reduction of the global probability of core damage, significant reduction of radioactive releases, mainly for severe accident conditions, and reduction of individual and collective doses received by workers. (R.P.) 3 refs., 1 tab.

9957 (DES–182) **Use of PSA for improving the safety of French PWRs.** Lanore, J.M.; Chambon, J.L. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire. Jun 1994. 7p. (CONF-940462–: International conference on probalistic safe assessment/probabalistic risk analysis and severe accidents, Ljubljana (Slovenia), 17-20 Apr 1994). Order Number DE95618783. Source: OSTI; NTIS (US Sales Only); INIS.

Two French PWR Probabilistic Safety Assessment (PSA) studies were conducted for the standardized PWR series of 900 and 1300 MWe. Both PSA 900 and PSA 1300 are level 1 PSAs, that means their objective is the evaluation of core meltdown frequency. These studies have some specific features, in particular the treatment of shutdown conditions, the treatment of long term post-accidental situations, and a wide use of French experience feedback. The PSAs are used for safety improvements of the French PWRs. Following the PSA results, several modifications to plants concerning the dominant sequences were decided. (R.P.). 2 refs., 4 figs.

9958 (IAEA-TECDOC–774) **Guidance for the application of the leak before break concept. Report of the IAEA extrabudgetary programme on the safety of WWER-440 model 230 nuclear power plants.** International Atomic Energy Agency, Vienna (Austria). Nov 1994. 43p. Order Number DE95618784. Source: OSTI; NTIS (US Sales Only); INIS.

This document provides additional guidance on application of the LBB concept to WWER-440/230 NPPs and complements the IAEA-TECDOC-710. The objective of the report is to describe in detail the elements of the LBB concept, the necessary support as well as the condition to be fulfilled, and the verification programme. It should also provide a clear picture of all the activities and resources needed to implement the LBB successfully as a comprehensive concept.

9959 (IAEA-TECDOC–778) **Fire hazard analysis for WWER nuclear power plants. Report of the IAEA extrabudgetary programme on the safety of WWER nuclear power plants.** International Atomic Energy Agency, Vienna (Austria). Dec 1994. 39p. Order Number DE95618785. Source: OSTI; NTIS (US Sales Only); INIS.

This status report presents an overview of the different techniques available to carry out a fire hazard analysis, from qualitative criteria to quantitative methodologies of different purposes and basis; and then, it details a simplified methodology based on a screening approach which could be used in former Soviet designed nuclear power plants. The methodology presented in this report is an adequate means to identify fire related plant specific vulnerabilities to severe accidents, and it provides a useful tool for ranking the various plant fires according to their significances, as well as technical basis for prioritizing the implementation of plant improvements. The applicability of the methodology proposed to the former Soviet Union designed reactors has been evaluated. Its usefulness to the purpose defined above is conclusive. However, some aspects need further consideration, among others data sources and screening criteria. Computer codes for studying fire effects and fire spread in plant locations are also dealt with. Some computer codes are shortly described, from simplified models to more complex ones which allow more accurate modelling of geometries and accounting for additional phenomena. 10 refs, 5 tabs.

9960 (IKE–6-187) **Instability investigations in natural circulation systems.** Jiang Shengyao. Stuttgart Univ. (Germany). Inst. fuer Kernenergetik und Energiesysteme. Sep 1994. 111p. (In German). Order Number DE95753800. Source: OSTI; NTIS (US Sales Only).

This thesis presents calculations and experiments on two-phase flow instability in a natural circulation system at nuclear heating reactor conditions. A 1-D two-phase flow drift model with four equations for mass, energy, momentum of water-steam mixture and void fraction of subcooled boiling with corresponding correlations, is described; a computer code is developed based on these equations. The experiments were performed using the test loop HRTL-5, which simulates the thermohydraulics of the 5-MW nuclear heating reactor developed by INET of Tsinghua University. Through integration of the four governing equations in each corresponding region, ordinary differential equations for needed parameters are derived. The system of coupled time-dependent differential equations can be solved by the VAX-8600 computer of IKE using the program system IMSL. Two types of density wave instabilities are presented; one of them occurs at low steam quality and the other at high steam quality. Strongly irregular oscillation of mass flow rate caused by subcooled boiling in the heated section and flashing in the riser at low system pressure are described. Flow excursion combined with density wave instability was observed in a range of exit subcoolings of the heated section. Calculated results agree with experimental data well at the 5-MW nuclear reactor conditions. Study of start-up of the 5-MW reactor is based on study of instability. Pressurized start-up and transition from pressurized condition to boiling condition are discussed. (orig.)

9961 (INIS-BR–3462) **Natural circulation in pressurized water reactors.** Bastos, J.L.F. (Coordenadoria para Projetos Especiais (COPESP), Sao Paulo, SP (Brazil)); Loureiro, L.V.; Rocha, R.T.V. da; Umbehaun, P.E. Associacao Brasileira de Ciencias Mecanicas, Rio de Janeiro, RJ (Brazil). 1992. 4p. (CONF-921234–: 4. Brazilian thermal science meeting (ENCIT-92), Rio de Janeiro (Brazil), 1-4 Dec 1992). Several analytical modelling have been done for steady-state and slow transients conditions, besides more sophisticated studies considering two and three dimensional effects in a very simple geometry. Under severe accident conditions for PWR a code to analyse natural circulation has been developed by Westinghouse. This paper discusses the problem of natural circulation in a complex geometry similar to that of nuclear power plants. A first experiment has been done at the integral test facility of 'Co-ordination of Special Projects-Ministry of Naval Affairs' (Coordenadoria para Projetos Especiais -Ministerio da Marinha, COPESP) for several flux conditions. The results obtained were compared with numerical simulations for the steady-state regime. 09 refs, 05 figs, 01 tab. (B.C.A.).

Fuel elements of PWR type nuclear reactors are composed of rod bundles, arranged in square arrays, held by grid type spacers. The coolant flows axially along the bundle. Although such elements are laterally open, pressure drop experiments are performed in closed type test sections, originating the appearance of subchannels of different geometries. Utilizing a test section of two bundles of 4 x 4 pins and performing experiments with and without separation between the bundles, the flow redistribution factors, the

friction, and the grid drag coefficients were determined for the interior subchannels. 03 refs, 06 figs, 02 tabs. (B.C.A.).

Core transients have been calculated with full core and single channel models by COBRA-IV-I and with single channel model by RELAPS/MOD2. From the single channel simulations, it has been found that for transients where the rate of change of the conditions is moderate to rapid, like in a small LOCA, there is an excellent agreement between the results of the two codes. For rapid transients as , in a large LOCA the. agreement is less favorable, although qualitatively similar results are obtained. Result obtained when using the more accurate full core model are generally different than that obtained when a SC model is used. Full core simulation indicates that the coolant which enters the core after the blowout flows mainly through the.cooler channels and bypasses the hot channels cools them only by heat conduction. This kind of simulation is essential for calculation and verification of the hot channel factor. (authors); 6 refs., 5 figs.

Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of the present work is to investigate the correlation of the axial distributions of the different reactivity coefficients with the neutron flux and the neutron flux squared. Calculations were carried out for the Zion Unit 2 PWR. Reactivity coefficients, forward fluxes and adjoint fluxes were all computed and correlations obtained. The core length was divided into 7 axial regions in order to obtain the effect on reactivity in the reactor as a whole of changing the cross sections in each axial region in turn. The parameters chosen for change were coolant density, coolant temperature and fuel temperature. The results appear to bear out our original hypothesis that the reactivity coefficient profiles have a higher positive correlation with the total flux squared profile than with the linear flux profile. (authors). 5 refs., 2 figs.

Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

The containment response in a hypothetical large loss of coolant accident can be divided into two major phases. A blowdown phase which lasts less than a minute and a long term phase, which is the topic of this paper, lasting for the remainder of the transient - on the order of hours. The long term containment pressure is controlled by the rate of heat exchange processes on the outer containment wall and by the driving force of heat and mass sources continuously released from the primary system. In order to estimate the magnitude of the primary energy sources, we have chosen to examine a hypothetical event in which the core remains partially uncovered for an extended period of time following a large loss of coolant accident. (authors). 3 refs., 2 figs.

9967 (INIS-mf–14471, pp. 10-14) **Leakage prediction in nuclear power plants using similarity formulae and genetic algorithms.** Bartal, Y. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

The world-wide quantities of plutonium, both, from reprocessed nuclear power plant fuel and from excess of weapon grade Pu are increasing yearly. This is true particularly in France which has chosen the path of fuel reprocessing rather then storing the spent fuel elements. Consequently, about 10 tons of reprocessed Pu are added yearly to the Pu stockpile in France alone. Large stockpiles of plutonium from water moderated reactors are expensive to maintain, and therefore, in addition to the problem of safeguarding,

there is a strong economic incentive to consume as large a quantity of Pu as possible. With the slow down of the LMFBR program in France, and its elimination in USA and Germany, there is an urgent need to develop a fuel cycle capable of utilizing the vast amounts of available Pu. There seem to be two basic approaches: one is to utilize 100% MO)C in the existing fuel elements, the second is to develop a new Uranium free fuel in which Pu will be burned without producing new Pu. In the present the study the mixed oxide fuel option was chosen being a more realistic approach for the near future. (authors). 4 refs., 3 tabs.

The Doppler coefficient of reactivity is an important factor in prediction of several transients in light water reactors. Some of the past studies raised the question about the 10% uncertainty that traditionally was taken in calculations of Doppler coefficient by LWR lattice code. In order to bridge the gap of lack of accurate benchmark problem to evaluate the accuracy of Doppler effect, Mosteller et al. proposed a computational benchmark problem of Doppler coefficient to evaluate the accuracy and consistency of LWR lattice physics code. In this paper we present the results obtained from WIMS-D4 lattice code and compare it with those obtained by CELL-2 lattice code part of the EPRI-PRESS reactor physics package. The results obtained from the Monte Carlo code MCNP-3A served as reference for both cases, and was taken from ref 1. (authors). 4 refs., 2 figs., 1 tab.

9970 (INIS-mf–14471, pp. 24-26) **A one-dimensional model for scoping studies of measures to reduce damage rate to PWR pressure vessels.** Shayer, Z. (California Univ., Berkeley, CA (United States). (CONF-9411188–: 1994 joint meeting of the nuclear societies of Israel, Tel Aviv (Israel), 28-29 Nov 1994). In *Transactions of the nuclear societies of Israel Joint meeting 1994.* 234p. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

In an EPRI sponsored project we were to study the feasibility of reducing the damage rate to the Pressure Vessel of PWRs using non conventional materials, such as tungsten and titanium hydride. The non conventional materials were to be placed in either one of the following locations: (1) Dummy fuel assemblies at the core periphery (the fuel replacement approach). (2) In the radial water reflector (the reflector/shield approach), and (3) In the thermal shield . Such a feasibility study can be (and has been) done as a comparative study. It needs to estimate the reduction only relative to a reference approach. It also has to assess the effects of a new approach on relevant core performance parameters, relative to the corresponding effects due to the reference approach. The core performance parameters considered in this work are the reactivity and average-to-peak power density. (authors). 3 refs.

9971 (INIS-mf–14471, pp. 26-30) **Optimal thermal-hydraulic design for the highly moderated mixed oxides fueled pressurized water reactor.** Saphier, D. (CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France)); Raymond, P. Israel Nuclear Society, Yavne (Israel); Israel Radiation Protection Association (Israel); Radiation Research Society of Israel (Israel); Israel Society of Medical Physics (Israel). Israel Nuclear Society, Yavne (Israel). Nov 1994. Sponsored by Technion Research and Development Foundation Ltd., Haifa (Israel);Israel Electricity Co., Tel Aviv (Israel);Israel Atomic Energy Commission, Tel Aviv (Israel);Ministry of Energy and Infrastructure, Jerusalem (Israel). (CONF-9411188–: 1994 joint meeting of the nuclear societies of Israel, Tel Aviv (Israel), 28-29 Nov 1994). In *Transactions of the nuclear societies of Israel Joint meeting 1994.* 234p. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

A feasibility study on using 100% mixed oxides fuel in an PWR with increased moderating ratio, RMA2, was initiated by the CEA. In the proposed core a]] the design parameters will be as close as possible to the French 1450 MW PWR, except the fuel pin diameter which will be reduced to achieve higher moderating ratios. Moderating ratios of $2 < V_M/V_F = < 4$ were considered. In the present study the thermal- hydraulic feasibility of using fuel assemblies with smaller diameter fuel pins was investigated. An assembly capable of burning 100% MOX fuel with reduced fuel pin diameter and increased number of mixing grids is conceived. In the present paper the methodology of applying the CHF correlation, the computational model and some results are presented.

9972 (JAERI-Tech–94-029) **Pressure loss characteristics of LSTF steam generator heat-transfer tubes. Pressure loss increase due to tube internal instruments.** Suzuki, Mitsuhiro (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1994. 53p. (In Japanese). Order Number DE95747902. Source: OSTI; NTIS; INIS.

The steam generator of the Large-Scale Test Facility (LSTF) includes 141 heat-transfer U-tubes with different lengths. Six U-tubes among them are furnished with 15 or 17 probe-type instruments (conduction probe with a thermocouple; CPT) protuberant into the primary side of the U-tubes. Other 135 U-tubes are not instrumented. This results in different hydraulic conditions between the instrumented and non-instrumented U-tubes with the same length. A series of pressure loss characteristics tests was conducted at a test apparatus simulating both types of U-tube. The following pressure loss coefficient (K_{CPT}) was reduced as a function of Reynolds number (Re) from these tests under single-phase water flow conditions. $K_{CPT}=0.16$ $5600 \leq Re \leq 52820$, $K_{CPT}=60.66 \times Re^{-0.688}$ $2420 \leq Re \leq 5600$, $K_{CPT}=2.664 \times 10^{6} Re^{-2.06}$ $1371 \leq Re \leq 2420$. The maximum uncertainty is 22%. By using these results, the total pressure loss coefficients of full length U-tubes were estimated. It is clarified that the total pressure loss of the shortest instrumented U-tube is equivalent to that of the middle-length non-instrumented U-tube and also that a middle-length instrumented U-tube is equivalent to the longest non-instrumented U-tube. Concludingly. it is important to take account of the CPT pressure loss mentioned above in estimation of fluid behavior at the non-instrumented U-tubes either by using the LSTF experiment data from the CPT-installed U-tubes or by using any analytical codes. (author).

9973 (KFK–5366) **Feasibility study for an alternative PWR-containment. Stage 3.** Eibl, J. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Aug 1994. 225p. (In German). Order Number DE95756069. Source: OSTI; NTIS (US Sales Only); INIS.

The following report deals with a feasibility study on a lightwater reactor containment which is oriented at the German 1300 MW Convoy Type reactor. It was the aim of this containment development for a future nuclear ractor to restrict all consequences of an extreme reactor failure exclusively to the interior of the containment. Also the decay heat of the relevant core catchers is provided to be removed by passive means. This containment development was a common project with the Nuclear Research Centre at Karlsruhe (KFK). As a consequence of this intention the concept started from upper physical limits, such as a maximum static pressure of 1,5 MPa at 200 , a global and local detonation pressure of 8,4 MPa at an impulse of 5,0 kPas, an upward directed force exerted by the pressure vessel of 300 MN, a horizontal force exerted by the moving pressure vessel onto its environment of 70 MN, a cavern pressure around the core catcher of 3,0 resp., 2,0 MPa and a steam explosion-energy of 300 MJ. Such a containment concept

is presented and inverstigated with respect to its feasibility, statically and dynamically in all relevant details including earthquake actions. (orig.)

9974 (NUREG/CR–6245) **Assessment of pressurized water reactor control rod drive mechanism nozzle cracking.** Shah, V.N.; Ware, A.G.; Porter, A.M. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Programs; Idaho National Engineering Lab., Idaho Falls, ID (United States). Oct 1994. 51p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. (EGG–2715). Source: OSTI; NTIS; GPO; INIS.

This report surveys the field experience related to cracking of pressurized water reactor (PWR) control rod drive mechanism nozzles (Alloy 600 material); evaluates design, fabrication, and operating conditions for the nozzles in US PWR; and evaluates the safety significance of nozzle cracking. Inspection at 78 overseas and one US PWR has revealed mainly axial cracks in 101 nozzles. The cracking is caused by primary water stress corrosion cracking, which requires the simultaneous presence of high tensile stresses, high operating temperatures, and susceptible microstructure. CRDM nozzle cracking is not a short-term safety issue. An axial crack is not likely to grow above the vessel head to a critical length because the stresses are not high enough to support the growth away from the attachment weld. Primary coolant leaking through an axial crack could cause a short circumferential crack on the outside surface. However, this crack is not likely to propagate through the nozzle wall to cause rupture. Leakage of the primary coolant from a through-wall crack could cause boric acid corrosion of the vessel head and challenge the structural integrity of the head, but it is very unlikely that the accumulated deposits of boric acid crystals resulting from such leakage could remain undetected.

(CONF-9411188–: 1994 joint meeting of the nuclear societies of Israel, Tel Aviv (Israel), 28-29 Nov 1994). In *Transactions of the nuclear societies of Israel Joint meeting 1994*. 234p. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

The RBMK core has a high degree of asymmetry, both, in its geometry and burn up. For a sufficiently accurate calculation a full scale 3-D model has to be used. for the Chernobylsk-3-3 reactor. The conditions evaluated included voiding the core and voiding the control channels. The major conclusion from the study is that the reactivity from voiding the control channels is much larger than voiding the entire core fuel channels. Since the core fuel channel voiding accident is much more probable and much faster than voiding the control channels, improvement were introduced into the reactor by adding additional full length absorbers and increasing the fuel enrichment. These improvement reduce significantly the reactivity contribution from the core voiding. (author). 4 refs., 3 tabs.

9976 (JAERI-Research–94-034) **Numerical prediction on turbulent heat transfer of a spacer ribbed fuel rod for high temperature gas-cooled reactors.** Takase, Kazuyuki (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1994. 33p. Order Number DE95747907. Source: OSTI; NTIS; INIS.

The turbulent heat transfer of a fuel rod with three-dimensional trapezoidal spacer ribs for high temperature gas-cooled reactors was analyzed numerically using the k-ϵ turbulence model, and investigated experimentally using a simulated fuel rod under the helium gas condition of a maximum outlet temperature of 1000degC and pressure of 4MPa. From the experimental results, it found that the turbulent heat transfer coefficients of the fuel rod were 18 to 80% higher than those of a concentric smooth annulus at a region of Reynolds number exceeding 2000. On the other hand, the predicted average Nusselt number of the fuel rod agreed well with the heat transfer correlation obtained from the experimental data within a relative error of 10% with Reynolds number of more than 5000. It was verified that the numerical analysis results had sufficient accuracy. Furthermore, the numerical prediction could clarify quantitatively the effects of the heat transfer augmentation by the spacer rib and the axial velocity increase due to a reduction in the annular channel cross-section. (author).

9977 (ORNL/M–3768) **Interim report on the post irradiation examination of capsules 2 and 3 of the HFR-B1 experiment.** Myers, B.F. (ed.) (Oak Ridge National Lab., TN (United States)); Pott, G.; Schenk, W.; Schroeder, R.; Kuehlein, W.; Buecker, H.J.; Dahmen, H.; Landsgesell, K.; Nieveler, F. Oak Ridge National Lab., TN (United States). Sep 1994. 198p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95002373. Source: OSTI; NTIS; INIS; GPO Dep.

This is an interim report on the post irradiation examination (PIE) of capsules 2 and 3 of the HFR-B1 experiment The PIE has been conducted by the Forschungszentrum Juelich and is nearing completion. After disassembly of the capsules, the examination focused on capsule components including fuel compacts, inert compacts fired in different media, graphite cylinders of different grades, unbonded coated fuel particles and unfueled graphite; in addition, heating experiments with intermittent injections of water vapor were conducted using fuel compacts and the kernels of uranium oxycarbide. Measurement involved gamma scanning and counting, photography, metallography, dimensional and weight changes, burnup determination and fission product release.

Pre-conference paper.

Candu type nuclear reactor pressure tubes suffer deformations during operation. This are consequences of irradiation growth and creep. By means of a computer code which takes into account the material microstructure, the above mentioned deformations are calculated, and results are compared with corresponding values measured at Embalse nuclear power plant. The calculations make

explicit inclusion of intergranular stresses caused by an isotropy in the material. (author). 1 ref.

This paper describes an integrated study of the Argonne-West Fuel Cycle Facility (FCF) interconnected ventilation systems during various operations. Analyses and test results include first a nominal condition reflecting balanced pressures and flows followed by several infrequent and off-normal scenarios. This effort is the first study of the FCF ventilation systems as an integrated network wherein the hydraulic effects of all major air systems have been analyzed and tested. The FCF building consists of many interconnected regions in which nuclear fuel is handled, transported and reprocessed. The ventilation systems comprise a large number of ducts, fans, dampers, and filters which together must provide clean, properly conditioned air to the worker occupied spaces of the facility while preventing the spread of airborne radioactive materials to clean am-as or the atmosphere. This objective is achieved by keeping the FCF building at a partial vacuum in which the contaminated areas are kept at lower pressures than the other worker occupied spaces. The ventilation systems of FCF and the EBR-II reactor are analyzed as an integrated totality, as demonstrated. We then developed the network model shown in Fig. 2 for the TORAC code. The scope of this study was to assess the measured results from the acceptance/flow balancing testing and to predict the effects of power failures, hatch and door openings, single-failure faulted conditions, EBR-II isolation, and other infrequent operations. The studies show that the FCF ventilation systems am very controllable and remain stable following off-normal events. In addition, the FCF ventilation system complex is essentially immune to reverse flows and spread of contamination to clean areas during normal and off-normal operation.

9981 (ANL/TD/CP–84443) **Safety issues of dry fuel storage at RSWF.** Clarksean, R.L.; Zahn, T.P. Argonne National Lab., Idaho Falls, ID (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941207–19: Spent nuclear fuel meeting: challenges and initiatives, Salt Lake City, UT (United States), 14-16 Dec 1994). Order Number DE95005869. Source: OSTI; NTIS; INIS; GPO Dep.

Safety issues associated with the dry storage of EBR-II spent fuel are presented and discussed. The containers for the fuel have been designed to prevent a leak of fission gases to the environment. The storage system has four barriers for the fission gases. These barriers are the fuel cladding, an inner container, an outer container, and the liner at the RSWF. Analysis has shown that the probability of a leak to the environment is much less than 10^{-6} per year, indicating that such an event is not considered credible. A drop accident, excessive thermal loads, criticality, and possible failure modes of the containers are also addressed.

9982 (KFK–5264) **Irradiation programme SAMARCANDE. Impact test results.** Rieth, M.; Dafferner, B.; Ries, H.; Romer, O. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung; Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Materialforschung; Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Versuchstechnik. Aug 1994. 119p. (In German). Order Number DE95752052. Source: OSTI; NTIS (US Sales Only); INIS.

To produce proof of the usability of the martensitic 10.5% Cr-steel 1.4914 as alternative wrapper tube material the irradiation induced embrittlement was characterised with impact tests. The examinations were based on specimens, which were fabricated out of an irradiated wrapper tube. The irradiation was carried out within the EFR project (European Fast Reactor) in the PHENIX reactor in Cadarache (irradiation programme SAMARCANDE). The evaluation of ductile-to-brittle-transition temperatures and upper shelf energies of safety relevant segments of the tube led to a positive assessment: the 10.5% Cr-steel 1.4914 is excellently suited to the usage as wrapper tube material. (orig.)

9983 (KFK–5360) **An analysis of electron beam welds in a dual coolant liquid metal breeder blanket.** Cizelj, L. (Institut Jozef Stefan, Ljubljana (Slovenia). Reactor Engineering Div.); Riesch-Oppermann, H. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion; Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Materialforschung. Oct 1994. 90p. Order Number DE95752050. Source: OSTI; NTIS (US Sales Only); INIS.

Numerical simulation of electron beam welding of blanket segments was performed using non-linear finite element code ABAQUS. The thermal and stress fields were assumed uncoupled, while preserving the temperature dependency of all material parameters. The martensite-austenite and austenite-martensite transformations were taken into account through volume shrinking/expansion effects, which is consistent with available data. The distributions of post welding residual stress in a complex geometry of the first wall are obtained. Also, the effects of preheating and post-welding heat treatment were addressed. Time dependent temperature and stress-strain fields obtained provide good insight into the welding process. They may be used directly to support reliability and life-time studies of blanket structures. On the other hand, they provide useful hints about the feasibility of the geometrical configurations as proposed by different design concepts. (orig.)

9984 (PNL–10378) **Peer review of the Barselina Level 1 probabilistic safety assessment of the Ignalina Nuclear Power Plant, Unit 2.** McKay, S.L. (Pacific Northwest Lab., Richland, WA (United States)); Coles, G.A. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 64p. Sponsored by Agency for International Development, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95005960. Source: OSTI; NTIS; INIS; GPO Dep.

The Barselina Project is a Swedish-funded, cooperative effort among Lithuania, Russia and Sweden to transfer Western probabilistic safety assessment (PSA) methodology to the designers/operators of Ignalina Nuclear Power Plant (INPP). The overall goal is to use the PSA as a tool for assessing plant operational safety. The INPP is a two-unit, Former Soviet Union-designed nuclear facility located in Lithuania. The results of this PSA will ultimately be used to identify plant-specific improvements in system design and the conduct of facility operations, allowing improved operational safety. Pacific Northwest Laboratory (PNL) was asked to perform an independent expert peer review of the Barselina PSA. This report documents the findings of this review. This review, financed with nuclear safety assistance funds through the US Agency for International Development (USAID) and the US Department of Energy (DOE), satisfies Task II of the PNL peer review of the Barselina project. The objective is to provide an independent, inproce ss examination of the Barselina Level 1 PSA of Ignalina Nuclear Power Plant, Unit 2. The review consisted of an investigation of the project documentation, interviews, and extensive discussions with the PSA staff during critical stages of the project. PNL assessed the readability, completeness, consistency, validity, and applicability of the PSA. The major aspects explored were its purpose, major assumptions, analysis/modeling, results, and interpretation. It was not within the scope of this review to perform plant walkdowns or to review material other than the PSA documentation.

9985 (JAERI-Research–94-039) **Behavior of stainless steel cladding fuel under a fast power transient condition. NSRR**

SC-1 test results. Katanishi, Shoji (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Ishijima, Kiyomi; Kobayashi, Shinsho; Kikuchi, Teruo; Ochiai, Masa-aki. Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1994. 62p. (In Japanese). Order Number DE95747901. Source: OSTI; NTIS; INIS.

This report summarizes the results of an NSRR power transient test which was conducted to investigate the behavior of stainless steel cladding fuel under a fast power transient condition. The test fuel rod was a stainless steel cladding fuel that was the same type as a fuel for a power reactor of a nuclear ship 'Mutsu'. This test fuel rod had been preirradiated in the JMTR (Japan Materials Testing Reactor) up to the fuel burnup of 4.0GWd/t. At the transient irradiation in the NSRR, after the linear heat of the test fuel rod was kept at 49W/cm that was 13% of full power of 'Mutsu' reactor for 40 seconds, it was increased up to 400W/cm that was 130% of full power during 5 seconds, and linear power of 400W/cm was kept for next 7 seconds. No data which indicates the possibility of fuel failure, occurrence of DNB (Departure from Nucleate Boiling) or cladding deformation due to PCMI (Pellet/Cladding Mechanical Interaction) was obtained in the transient irradiation in the NSRR. Non-destructive and destructive fuel examination after the irradiation did not show the evidence of cladding temperature increase by the DNB or occurrence of chemical or mechanical interaction between pellet and cladding. These results show that the integrity of the fuel rod is kept under the fast power increase of this condition. (author).

9986 (LA-UR–94-4199) **Heat pipe cooled reactors for multi-kilowatt space power supplies.** Ranken, W.A.; Houts, M.G. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9505155–1: 9. international heat pipe conference, Albuquerque, NM (United States), 1-5 May 1995). Order Number DE95005211. Source: OSTI; NTIS; INIS; GPO Dep.

Three nuclear reactor space power system designs are described that demonstrate how the use of high temperature heat pipes for reactor heat transport, combined with direct conversion of heat to electricity, can result in eliminating pumped heat transport loops for both primary reactor cooling and heat rejection. The result is a significant reduction in system complexity that leads to very low mass systems with high reliability, especially in the power range of 1 to 20 kWe. In addition to removing heat exchangers, electromagnetic pumps, and coolant expansion chambers, the heat pipe/direct conversion combination provides such capabilities as startup from the frozen state, automatic rejection of reactor decay heat in the event of emergency or accidental reactor shutdown, and the elimination of single point failures in the reactor cooling system. The power system designs described include a thermoelectric system that can produce 1 to 2 kWe, a bimodal modification of this system to increase its power level to 5 kWe and incorporate high temperature hydrogen propulsion capability, and a moderated thermionic reactor concept with 5 to 20 kWe power output that is based on beryllium modules that thermally couple cylindrical thermionic fuel elements (TFEs) to radiator heat pipes.

9987 **Radial flow nuclear thermal rocket (RFNTR).** Leyse, C.F. To Dept. of Energy. 1992. Filed date 3 Nov 1992. U.S. Patent Application 7-970,888. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE95006110. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of a radial flow nuclear thermal rocket fuel assembly which includes a substantially conical fuel element having an inlet side and an outlet side. An annular channel is disposed in the element for receiving a nuclear propellant, and a second, conical, channel is disposed in the element for discharging the propellant. The first channel is located radially outward from the second channel, and separated from the second channel by an annular fuel bed volume. This fuel bed volume can include a packed bed of loose fuel beads confined by a cold porous inlet frit and a hot porous exit frit. The loose fuel beads include ZrC coated ZrC-UC beads. In this manner, nuclear propellant enters the fuel assembly axially into the first channel at the inlet side of the element, flows radially inward through the fuel bed volume, and is discharged from the assembly by flowing axially outward from the second channel at the outlet side of the element.

2107 Regulation and Licensing

9988 (DES–165e) **French regulatory approach to establishing the safety case for ageing NPP's.** Delage, M. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire. Jun 1994. 19p. (CONF-9306406–: Meeting on the safety case for ageing plants, Paris (France), 22-23 Jun 1993). Order Number DE95619120. Source: OSTI; NTIS (US Sales Only); INIS.

The French regulatory procedures make provision for three main stages in the safety assessment of nuclear power plants. The first stage ends up with the construction licence and focuses on the assessment of the preliminary safety report. The second stage makes it possible to issue the fuel loading approval following evaluation of the provisional safety report. The third stage permits to declare the start of normal operation of the installation. The procedure, the tests and the assessment forming the overall strategy for safety regulations are described in detail. (R.P.).

9989 (DES–171e) **Experiment to evaluate software safety.** Soubies, B.; Henry, J.Y. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire. 23 Jun 1994. 10p. Order Number DE95619121. Source: OSTI; NTIS (US Sales Only); INIS.

The process of licensing nuclear power plants for operation consists of mandatory steps featuring detailed examination of the instrumentation and control system by the safety authorities, including softwares. The criticality of these softwares obliges the manufacturer to develop in accordance with the IEC 880 standard 'Computer software in nuclear power plant safety systems' issued by the International Electronic Commission. The evaluation approach, a two-stage assessment is described in detail. In this context, the IPSN (Institute of Protection and Nuclear Safety), the technical support body of the safety authority uses the MALPAS tool to analyse the quality of the programs. (R.P.). 4 refs.

9990 (DES–172f) **Contribution to the safety assessment of instrumentation and control software for nuclear power plants. Application to spin N4.** Soubies, B.; Boulc'h, J.; Elsensohn, O.; Le Meur, M.; Henry, J.Y. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire. 23 Jun 1994. 14p. (In French). Order Number DE95619122. Source: OSTI; NTIS (US Sales Only); INIS.

The process of licensing nuclear power plants for operation consists of mandatory steps featuring detailed examination of the instrumentation and control system. Significant changes were introduced by the operator in the process of designing and producing 1400 MWe pressurized water reactor safety systems and, in particular, in the case of the Digital Integrated Protection System, (French abbreviation SPIN). The methodology applied by the Institute of Protection and Nuclear Safety (IPSN) to examine the software of this system is described. It consists of the methods used by the manufacturer to develop SPIN software for the 1400 MWe PWRs, and the approach adopted by the IPSN to evaluate SPIN safety softwares of the protection system for the N4 series of reactors. (R.P.). 2 refs.

9991 (INIS-mf–14455) **Annual report 1991-92.** Atomic Energy Regulatory Board, Bombay (India). [1992]. 26p. Order Number DE95619155. Source: OSTI; NTIS (US Sales Only); INIS.

The Atomic Energy Regulatory Board (AERB) was constituted on November 15, 1983 to carry out certain regulatory and safety functions. The mission of the Board is to ensure that the use of ionizing radiation and nuclear energy in India does not cause undue risk to health, safety and the environment. The annual report of AERB for the year 1991-1992 contains a brief review of the safety aspects of Indian nuclear power plants, and other nuclear facilities, safety standards and guidelines being adopted in these installations, and the development and implementation of regulatory procedures and a comprehensive statement about the other activities of the Board. It also gives a list of training courses and seminars organised and

research programmes being undertaken along with the public information campaigns. The report also contains annexures in which details about the constitution of the AERB and its various committees are given. (M.K.V.).

9992 (INPO–95005096) **Institutional plan – Institute of Nuclear Power Operations, 1993.** Institute of Nuclear Power Operations, Atlanta, GA (United States). 1993. 30p. Sponsored by Institute of Nuclear Power Operations, Atlanta, GA (United States). Source: OSTI; INIS; Institute of Nuclear Power Operations, 700 Galleria Parkway, Atlanta, GA 30339-5947.

The US nuclear electric utility industry established the Institute of Nuclear Power Operations (INPO) in 1979 to promote the highest levels of safety and reliability – to promote excellence – in the operation of its nuclear plants. After its formation, the Institute grew from a handful of on-loan personnel in late 1979 to an established work force of more than 400 permanent and on-loan personnel. INPO's early years were marked by growth and evolution of its programs and organization. The Institute now focuses primarily on the effectiveness and enhancement of established programs and activities. For INPO to carry out its role, it must have the support of its members and participants and a cooperative but independent relationship with the NRC. A basis for that support and cooperation is an understanding of INPO's role. This Institutional Plan is intended to provide that understanding by defining the Institute's role and its major programs. This plan considers the existing and projected needs of the industry and the overall environment in which INPO and its members and participants operate.

9995 (NUREG–1511) **Reactor pressure vessel status report.** Strosnider, J. (and others); Wichman, K.; Elliot, B. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering. Dec 1994. 159p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

This report gives a brief description of the reactor pressure vessel (RPV), followed by a discussion of the radiation embrittlement of RPV beltline materials and the two indicators for measuring embrittlement, the end-of-license (EOL) reference temperature and the EOL upper-shelf energy. It also summarizes the GL 92-01 effort and presents, for all 37 boiling water reactor plants and 74 pressurized water reactor plants in the United States, the current status of compliance with regulatory requirements related to ensuring RPV integrity. The staff has evaluated the material data needed to predict neutron embrittlement of the reactor vessel beltline materials. These data will be stored in a computer database entitled the reactor vessel integrity database (RVID). This database will be updated annually to reflect the changes made by the licensees in future submittals and will be used by the NRC staff to assess the issues related to vessel structural integrity.

9996 (USCEA–95006094) **Advanced design nuclear power plants: Competitive, economical electricity. An analysis of the cost of electricity from coal, gas and nuclear power plants.** US Council for Energy Awareness, Washington, DC (United States). Jun 1992. 49p. Sponsored by US Council for Energy Awareness, Washington, DC (United States). Order Number DE95006094. Source: OSTI; NTIS; INIS; U.S. Council for Energy Awareness, Suite 400, 1776 I Street, N.W., Washington, DC (20006-3708 (United States); GPO Dep.

This report presents an updated analysis of the projected cost of electricity from new baseload power plants beginning operation around the year 2000. Included in the study are: (1) advanced-design, standardized nuclear power plants; (2) low emissions coal-fired power plants; (3) gasified coal-fired power plants; and (4) natural gas-fired power plants. This analysis shows that electricity from advanced-design, standardized nuclear power plants will be economically competitive with all other baseload electric generating system alternatives. This does not mean that any one source of electric power is always preferable to another. Rather, what this analysis indicates is that, as utilities and others begin planning for future baseload power plants, advanced-design nuclear plants should be considered an economically viable option to be included in their detailed studies of alternatives. Even with aggressive and successful conservation, efficiency and demand-side management programs, some new baseload electric supply will be needed during the 1990s and into the future. The baseload generating plants required in the 1990s are currently being designed and constructed. For those required shortly after 2000, the planning and alternatives assessment process must start now. It takes up to ten years to plan, design, license and construct a new coal-fired or nuclear fueled baseload electric generating plant and about six years for a natural gas-fired plant. This study indicates that for 600-megawatt blocks of capacity, advanced-design nuclear plants could supply electricity at an average of 4.5 cents per kilowatt-hour versus 4.8 cents per kilowatt-hour for an advanced pulverized-coal plant, 5.0 cents per kilowatt-hour for a gasified-coal combined cycle plant, and 4.3 cents per kilowatt-hour for a gas-fired combined cycle combustion turbine plant.

9997 (ANL/TD/CP–85127) **Methodology and application of the WIMS-D4M fission product data.** Mo, S.C. Argonne National Lab., IL (United States). [1995]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9409102–11: OCEANS '94, Brest (France), 13-16 Sep 1994). Order Number DE95007086. Source: OSTI; NTIS; INIS; GPO Dep.

The WIMS-D4 code has been modified (WIMS-D4m) to generate burn-up dependent microscopic cross sections for use in full core depletion calculations. The calculation of neutron absorption by fission products can be obtained from a reduced fission-product-chain model that includes the ^{135}Xe and ^{149}Sm chains, and a lumped fission product to account for the absorption by fission products not

explicitly treated. Burn-up calculations were performed for the ANS MEU core using WIMS and EPRI-CELL cross sections. The calculated eigenvalues and material loadings are in good agreements.

9998 (CONF-950420–13) **Automatic rapid processing cross section libraries for the prediction of PWR spent fuel isotopic compositions.** Leal, L.C.; Hermann, O.W.; Parks, C.V. Oak Ridge National Lab., TN (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International conference on mathematics and computations, reactor physics, and environmental analyses; Portland, OR (United States); 30 Apr - 4 may 1995. Order Number DE95006385. Source: OSTI; NTIS; INIS; GPO Dep.

Point-depletion calculations in the SCALE code system are performed with the ORIGEN-S code with problem-dependent cross-section libraries generated in the SAS2H sequence. This methodology for cross-section generation for point-depletion calculations with the ORIGEN-S code which in turn serve as an alternative for the SCALE/SAS2H cross-section sequence. The adequacy of the methodology is evaluated by comparing measured and computed spent fuel isotopic compositions.

9999 (CONF-950420–14) **Validation of the WIMSD4M cross-section generation code with benchmark results.** Leal, L.C. (Oak Ridge National Lab., TN (United States)); Deen, J.R.; Woodruff, W.L. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International conference on mathematics and computations, reactor physics, and environmental analyses; Portland, OR (United States); 30 Apr - 4 may 1995. Order Number DE95006384. Source: OSTI; NTIS; GPO Dep.

The WIMSD4 code has been adopted for cross-section generation in support of the Reduced Enrichment for Research and Test (RERTR) program at Argonne National Laboratory (ANL). Subsequently, the code has undergone several updates, and significant improvements have been achieved. The capability of generating group-collapsed micro- or macroscopic cross sections from the ENDF/B-V library and the more recent evaluation, ENDF/B-VI, in the ISOTXS format makes the modified version of the WIMSD4 code, WIMSD4M, very attractive, not only for the RERTR program, but also for the reactor physics community. The intent of the present paper is to validate the procedure to generate cross-section libraries for reactor analyses and calculations utilizing the WIMSD4M code. To do so, the results of calculations performed with group cross-section data generated with the WIMSD4M code will be compared against experimental results. These results correspond to calculations carried out with thermal reactor benchmarks of the Oak Ridge National Laboratory(ORNL) unreflected critical spheres, the TRX critical experiments, and calculations of a modified Los Alamos highly-enriched heavy-water moderated benchmark critical system. The benchmark calculations were performed with the discrete-ordinates transport code, TWODANT, using WIMSD4M cross-section data. Transport calculations using the XSDRNPM module of the SCALE code system are also included. In addition to transport calculations, diffusion calculations with the DIF3D code were also carried out, since the DIF3D code is used in the RERTR program for reactor analysis and design. For completeness, Monte Carlo results of calculations performed with the VIM and MCNP codes are also presented.

Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

The Nuclear Engineering Department at Israel Electric Company has been engaged for a number of years in a joint research agreement with the Technion Nuclear Reactor Research Group on various thermal-hydraulic aspects of reactor design and safety. Besides developing their own analytical models, the researchers rely heavily on the RELAPS computer code in their analyses. The RELAPS series are general purpose, thermal-hydraulic system codes, used to simulate system response (such as the RCS) to transients and accidents. They are based on solving the equations of conservation of mass, energy and momentum within the system being modeled, where the model is a series of control volumes connected by junctions. The equations are solved simultaneously in each volume and junction using a finite difference numerical scheme. As an example, a recent report refers to containment response to a large LOCA in an AP600-like advanced rector. This work has been performed using RELAPS/Mod2. Accidents like LOCA represent design base events necessary to verify the adequacy of the emergency core cooling system, the passive containment system and other safety systems. The validation of simulation results is therefore important to the IEC staff responsible for monitoring the research. (author); 3 refs.

Source: OSTI; NTIS; INIS; GPO Dep.

Calculations have been performed with the MCNP Monte Carlo code for 13 different thermal-reactor lattices, using continuous-energy libraries derived from ENDF/B-V and from ENDF/B-VI. These calculations represent the first extensive comparisons of ENDF/B-V and ENDF/B-VI results for reactor lattices. The two sets of libraries produce similar results for cases with low enriched uranium fuel. ENDF/B-VI tends to produce slightly higher values of k_∞ for cases with highly enriched uranium fuel and slightly lower values for cases with slightly enriched uranium fuel and cases with substantial amounts of plutonium. The differences for the uranium cases appear to result from competition between a more positive reactivity contribution from ^{235}U and a more negative contribution from ^{238}U at thermal energies.

10004 (LA-UR–94-3154) **Asymptotic analysis of the several competitive equations to solve the time-dependent neutron transport equation.** Shin, U. (California Univ., Berkeley, CA

(United States)); Miller, W.F. Jr.; Morel, J.E. Los Alamos National Lab., NM (United States). [1994]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950420–7: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 may 1995). Order Number DE95001022. Source: OSTI; NTIS; INIS; GPO Dep.

Using conventional diffusion limit analysis, we asymptotically compare three competitive time-dependent equations (the telegrapher's equation, the time-dependent Simplified P_2 (SP_2) equation, and the time-dependent Simplified Even-Parity (SEP) equation). The time-dependent SP_2 equation contains higher order asymptotic approximations of the time-dependent transport equation than the other equations in a physical regime in which the time-dependent diffusion equation is the leading order approximation. In addition, we derive the multigroup modified time-dependent SP_2 equation from the multigroup time-dependent transport equation by means of an asymptotic expansion in which the multigroup time-dependent diffusion equation is the leading, order approximation. Numerical comparisons of the timedependent diffusion, the telegrapher's, the time-dependent SP_2, and S_8 solutions in 2-D X-Y geometry show that, in most cases, the SP_2 solutions contain most of the transport corrections for the diffusion approximation.

10005 (LA-UR–94-3259) **THREEDANT: A code to perform three-dimensional, neutral particle transport calculations.** Alcouffe, R.E. Los Alamos National Lab., NM (United States). 19 Sep 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950420–8: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 may 1995). Order Number DE95001007. Source: OSTI; NTIS; INIS; GPO Dep.

The THREEDANT code solves the three-dimensional neutral particle transport equation in its first order, multigroup, discrate ordinate form. The code allows an unlimited number of groups (depending upon the cross section set), angular quadrature up to S-100, and unlimited Pn order again depending upon the cross section set. The code has three options for spatial differencing, diamond with set-to-zero fixup, adaptive weighted diamond, and linear modal. The geometry options are XYZ and RZΘ with a special XYZ option based upon a volume fraction method. This allows objects or bodies of any shape to be modelled as input which gives the code as much geometric description flexibility as the Monte Carlo code MCNP. The transport equation is solved by source iteration accelerated by the DSA method. Both inner and outer iterations are so accelerated. Some results are presented which demonstrate the effectiveness of these techniques. The code is available on several types of computing platforms.

10006 (LA-UR–94-3380) **Asymptotic derivation of the multigroup P_1 and Simplified P_N equations with anisotropic scattering.** Larsen, E.W. (Michigan Univ., Ann Arbor, MI (United States). Dept. of Nuclear Engineering); Morel, J.E.; McGhee, J.M. Los Alamos National Lab., NM (United States). [1994]. 11p. Sponsored by National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-36. Grant ECS-9107725. (CONF-950420–6: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 may 1995). Order Number DE95000926. Source: OSTI; NTIS; GPO Dep.

The multigroup and P_1 and Simplified P_N equations are shown to be a family of asymptotic approximation to the multigroup transport equation with anisotropic scattering. The physical assumptions are that the material system is optically thick, the probability of absorption is small, and the mean scattering angle $\bar{\mu}_0$ is not close to unity.

10007 (LA-UR–94-3382) **A 3-D time-dependent unstructured tetrahedral-mesh SP_N method.** Morel, J.E. (Los Alamos National Lab., NM (United States)); McGhee, J.M.; Larsen, E.W. Los Alamos National Lab., NM (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950420–4: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 may 1995). Order Number DE95000927. Source: OSTI; NTIS; GPO Dep.

We have developed a 3-D time-dependent multigroup SP_n method for unstructured tetrahedral meshes. The SP_n equations are expressed in a canonical form which allows them to be solved using standard diffusion solution techniques in conjunction with source iteration, diffusion-synthetic acceleration, and fission-source acceleration. A computational comparison of our SP_n method with an even-parity S_n method is given.

10008 (LA-UR–94-3383) **3-D research transport codes at Los Alamos.** Morel, J.E.; McGhee, J.M.; Walters, W.F. Los Alamos National Lab., NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950420–5: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 may 1995). Order Number DE95000928. Source: OSTI; NTIS; GPO Dep.

We describe 3-D research transport codes which have been developed at Los Alamos National Laboratory over the last three years. Some simple example calculations are presented.

10009 (LA-UR–95-235) **A diffusion accelerated solution method for the nonlinear characteristic scheme.** Wareing, T.A.; Walters, W.F.; Morel, J.E. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950420–15: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 may 1995). Order Number DE95006333. Source: OSTI; NTIS; INIS; GPO Dep.

Recently the nonlinear characteristic scheme for spatially discretizing the discrete-ordinate equations was introduced. This scheme is accurate for both optically thin and optically thick spatial meshes and produces strictly positive angular and scalar fluxes. The nonlinear characteristic discrete-ordinate equations can be solved using the source iteration method; however, it is well known that the this method converges prohibitively slowly for optically thick problems with scattering ratios at or near unity. In this paper we describe a diffusion accelerated solution method for solving the nonlinear characteristic equations in slab geometry.

10010 (NEA-NSC-DOC–94-28) **Benchmark calculations of power distribution within assemblies.** Cavarec, C.; Perron, J.F.; Verwaerde, D.; West, J.P. Nuclear Energy Agency, 75 - Paris (France); Electricite de France (EDF), 92 - Clamart (France). Sep 1994. 296p. (NEA/NSC/DOC–94-28.). Order Number DE95620343. Source: OSTI; NTIS (US Sales Only); INIS.

The main objective of this Benchmark is to compare different techniques for fine flux prediction based upon coarse mesh diffusion or transport calculations. We proposed 5 "core" configurations including different assembly types (17 x 17 pins, "uranium", "absorber" or "MOX" assemblies), with different boundary conditions. The specification required results in terms of reactivity, pin by pin fluxes and production rate distributions. The proposal for these Benchmark calculations was made by J.C. LEFEBVRE, J. MONDOT, J.P. WEST and the specification (with nuclear data, assembly types, core configurations for 2D geometry and results presentation) was distributed to correspondents of the OECD Nuclear Energy Agency. 11 countries and 19 companies answered the exercise proposed by this Benchmark. Heterogeneous calculations and homogeneous calculations were made. Various methods were used to produce the results: diffusion (finite differences, nodal...), transport (P_{ij}, S_n, Monte Carlo). This report presents an analysis and intercomparisons of all the results received.

10011 (NUREG/CR–6291-Vol.2) **Nuclear plant analyzer: Analyzer reference manual.** Snider, D.M.; Wagner, K.L.; Grush, W.H.; Jones, K.R. Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research; Idaho National Engineering Lab., Idaho Falls, ID (United States). Jan 1995. 67p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. Source: OSTI; NTIS; INIS; GPO.

The Nuclear Plant Analyzer (NPA) system provides both a highly flexible graphical user interface for displaying simulation data and,

where applicable, a convenient means of interactively controlling the host program through user-defined pop-up menus. The NPA system was developed at the Idaho National Engineering Laboratory under the sponsorship of the U.S. Nuclear Regulatory 91 Commission (NRC). The Computer Visual System and the Analyzer are the primary components of the NPA system. This report contains the reference manual for the Analyzer. It describes both the NPA libraries that constitute the Analyzer and a set of auxiliary programs used in conjunction with the Analyzer.

10012 (NUREG/CR–6291-Vol.3) **Nuclear plant analyzer: Computer visual system reference manual.** Snider, D.M.; Wagner, K.L.; Grush, W.H.; Jones, K.R. Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research; Idaho National Engineering Lab., Idaho Falls, ID (United States). Jan 1995. 124p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. Source: OSTI; NTIS; INIS; GPO.

The Computer Visual System (CVS) Reference Manual describes that part of the Nuclear Plant Analyzer (NPA) system used to create pictures (masks). This manual is intended to guide a user in creating, editing, and animating masks for use in the NPA. The NPA was developed at the Idaho National Engineering Laboratory under the sponsorship of the U.S. Nuclear Regulatory Commission to provide a highly flexible graphical user interface for displaying the results of these analysis codes. The NPA also provides the user with a convenient means of interactively controlling the host program through user-defined pop-up menus. The NPA was designed to serve primarily as an analysis tool. After a brief introduction to the Computer Visual System and the NPA, an analyst can quickly create a simple picture or set of pictures to aide in the study of a particular phenomenon. These pictures can range from simple collections of square boxes and straight lines to complex representations of emergency response information displays.

10013 (CONF-941258–1) **Toward a mechanistic understanding of radiation effects in materials.** Pawel, J.E.; Bloom, E.E.; Mansur, L.K.; Rowcliffe, A.F.; Zinkle, S.J.; Stoller, R.E.; Maziasz, P.J. Oak Ridge National Lab., TN (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Ishino conference; Tokyo (Japan); 15-16 Dec 1994. Order Number DE95006530. Source: OSTI; NTIS; INIS; GPO Dep.

Substantial progress has been made to understanding radiation effects in materials, and in formulating and testing a metallurgical approach for developing radiation-resistant alloys. This understanding is a combination of theoretical modeling with experiments using mixed spectrum fission reactors, fast reactors and ion irradiations. The development of materials with properties to meet the challenges of advanced reactors has four major steps: (1) the development of a mechanistic understanding of the behavior of materials during irradiation in appropriate environments; (2) selection of candidate materials based on physical, chemical, and mechanical properties; (3) development of these candidate materials through compositional and microstructural control to achieve the necessary properties and radiation damage resistance; and (4) the development of a database sufficient to support engineering design, performance analysis, and safety assessment. This paper will present a brief overview of the present understanding of radiation effects in materials, with emphasis on work performed at Oak Ridge National Laboratory as part of the U.S. fusion materials and basic energy sciences programs. Progress in fundamental understanding of void swelling, phase formation and stability, irradiation creep, and post-irradiation mechanical properties has been gained through comparison of experimental data with the predictions of theoretical models. Applications of the understanding of radiation effects in materials have led to the development of candidate structural materials for use in aggressive radiation environments such as fast breeder reactors and proposed fusion energy systems. Because of the successes associated with the development of radiation resistant austenitic stainless steels, it is believed that these principles will provide the basis for addressing radiation issues in a variety of materials systems.

10014 (DES–178) **The PISC programme on defective steam generator tubes inspection. A status report.** Birac, C.; Comby, R.; Maciga, G.; Von Estorff, U.; Zanella, G.L. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire. Jun 1994. [24p.] (CONF-9403199–: Non-destructive examination practice and results, state of the art and PISC III results, Petten (Netherlands), 8-10 Mar 1994). Order Number DE95618678. Source: OSTI; NTIS (US Sales Only); INIS.

The general objective of the PISC Program (Programme for the Inspection of Steel Components) is to assess experimentally procedures and techniques in use for the in-service inspection of pressure components. The program is mainly a round robin test, the results of which are compared with real characteristics of the flaws obtained by destructive analysis. Materials tested are INCONEL 600 tubes, diameter 22.22 mm, wall thickness 1.27 mm. The technique applied is eddy current testing. The program of capability tests on loose tubes was started in 1990, the round robin tests ended in 1993. The preliminary results are presented. (R.P.). 8 refs., 9 figs., 4 tabs.

10015 (DES–186) **French participation to PISC III.** Birac, C.; Benoist, B.; Champigny, F. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire. Jun 1994. [19p.] (CONF-9403199–: Non-destructive examination practice and results, state of the art and PISC III results, Petten (Netherlands), 8-10 Mar 1994). Order Number DE95618679. Source: OSTI; NTIS (US Sales Only); INIS.

The general objective of the PISC programme (Programme for the Inspection of Steel Components) is to assess experimentally procedures and techniques in use for the in-service inspection of pressure components. The program is mainly a round robin test, the results of which are compared with real characteristics of the flaws obtained by destructive analysis. The program is now at the end of its third phase (PISC III). The participation of the French teams in several of the eight actions of the third phase is described, and the lessons for the future (partly coming from PISC exercises) are learned. (R.P.). 10 figs., 1 tab.

10016 (INIS-mf–14469, pp. 77) **Water treatment process for nuclear reactor.** Marawan, M.A.; Khattab, N.S.; Hanna, A.N. Atomic Energy Establishment, Cairo (Egypt). 1991. 106p. (CONF-9110549–: 2. radiation protection and Civil Defence Department Conference, Cairo (Egypt), 7-16 Oct 1991). In *Radiation Protection and Civil defence Department Conference.* Order Number DE95617966. Source: OSTI; NTIS (US Sales Only); INIS.

Water treatment for purification is very important in reactor cooling systems as well as in many industrial applications. since impurities in water are main source of problems, it is necessary to achieve and maintain high purity of water before utilization in reactor cooling systems. the present work investigate water treatment process for nuclear reactor utilization. analysis of output water chemistry proved that demineralizing process is an appropriate method. extensive experiments were conducted to determine economical concentration of the regenerates to obtain the optimum quantity of pure water which reached to 15 cubic meter instead of 10 cubic-meter per regeneration. running cost is consequently decreased by about 30%. output water chemistry agree with the recommended specifications for reactor utilization. the radionuclides produced in the primary cooling water due to reactor operation are determined. it is found that 70% of radioactive contaminants are retained by purification through resin of reactor filter. decontamination factor and filter efficiency are also determined.

10017 (INIS-mf–14471, pp. 12-17) **Rewetting of a finite rod an arbitrary space-dependent heat transfer coefficient.** Olek, S. (Israel Electric Corp. Ltd., Haifa (Israel)); Elias, E. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

Two-dimensional rewetting models usually assume two or three regions, with different boundary conditions specified at the solid surface. The more advanced analytical solutions by eigenfunction expansions obtain a formed expression of the temperature distribution in each sub region with a constant heat transfer coefficient. This expression contains some, yet, unknown constants which are determined by matching the temperatures and their axial gradients at the interface between adjacent sub domains. As far as we know, to date there does not exist an analytical solution of a rewetting model with an arbitrary space-dependent heat transfer coefficient. Moreover, eigenfunction expansions solutions of models with a discontinuous heat transfer coefficient have been shown to impede convergence of the series and to decrease the solution accuracy. In the present study, we solve by eigenfunction expansions a two-dimensional model of rewetting of a finite length slab or cylindrical rod, with an arbitrary space-dependent heat transfer coefficient. The unique features of the present approach are the simplicity of the solution, which does not necessitates a tedious splitting of the solution domain into sub domains, and avoiding the convergence problem associated with cases of discontinuous heat transfer coefficients. (authors); 5 refs.

10018 (NUREG/CP–0137-Vol.2) **Proceedings of the Third NRC/ASME Symposium on Valve and Pump Testing. Volume 2, Session 3A–Session 4B.** Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Reactor Regulation; EG and G Idaho, Inc., Idaho Falls, ID (United States). Jul 1994. 353p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. (EGG–2742-Vol.2; CONF-940664–Vol.2: ISFNT-3: 3rd international symposium on fusion nuclear technology, Los Angeles, CA (United States), 27 Jun - 1 jul 1994). Source: OSTI; NTIS; INIS.

The 1994 Symposium on Valve and Pump Testing, jointly sponsored by the Board of Nuclear Codes and Standards of the American Society of Mechanical Engineers and by the Nuclear Regulatory Commission, provides a forum for the discussion of current programs and methods for inservice testing and motor-operated valve testing at nuclear power plants. The symposium also provides an opportunity to discuss the need to improve that testing in order to help ensure the reliable performance of pumps and valves. The participation of industry representatives, regulators, and consultants results in the discussion of a broad spectrum of ideas and perspectives regarding the improvement of inservice testing of pumps and valves at nuclear power plants. Individual papers have been cataloged separately.

10019 (NUREG/CR–6154-Vol.1) **Experimental results from containment piping bellows subjected to severe accident conditions. Volume 1, Results from bellows tested in 'like-new' conditions.** Lambert, L.D. (Sandia National Labs., Albuquerque, NM (United States)); Parks, M.B. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Sandia National Labs., Albuquerque, NM (United States). Sep 1994. 77p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-94AL85000. (SAND–94-1711-Vol.1). Source: OSTI; NTIS; INIS; GPO.

Bellows are an integral part of the containment pressure boundary in nuclear power plants. They are used at piping penetrations to allow relative movement between piping and the containment wall, while minimizing the load imposed on the piping and wall. Piping bellows are primarily used in steel containments; however, they have received limited use in some concrete (reinforced and prestressed) containments. In a severe accident they may be subjected to pressure and temperature conditions that exceed the design values, along with a combination of axial and lateral deflections. A test program to determine the leak-tight capacity of containment penetration bellows is being conducted under the sponsorship of the US Nuclear Regulatory Commission at Sandia National Laboratories. Several different bellows geometries, representative of actual containment bellows, have been subjected to extreme deflections along with pressure and temperature loads. The bellows geometries and loading conditions are described along with the testing apparatus and procedures. A total of thirteen bellows have been tested, all in the 'like-new' condition. (Additional tests are planned of bellows that have been subjected to corrosion.) The tests showed that bellows are capable of withstanding relatively large deformations, up to, or near, the point of full compression or elongation, before developing leakage. The test data is presented and discussed.

10020 (NUREG/CR–6259) **Constraint effects on fracture initiation loads in HSST wide-plate tests.** Dodds, R.H. Jr. (Illinois Univ., Urbana, IL (United States)). Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Illinois Univ., Urbana, IL (United States); Oak Ridge National Lab., TN (United States). Dec 1994. 32p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. (UILU-ENG–94-2009; ORNL/TM–12796). Source: OSTI; NTIS; GPO; INIS.

During the period 1984–1987, researchers of the Heavy-Section Steel Technology program at the Oak Ridge National Laboratory performed a unique series of fracture mechanics tests using exceptionally large, SE(T) specimens (a/W=0.2) fabricated from a reactor pressure vessel material, A533B Class 1 steel. This study re-examines fracture initiation loads in the wide-plate tests using two constraint assessment methodologies developed over the past five years: the J-Q toughness locus approach and the toughness scaling approach based on a local failure criterion for cleavage. Both approaches demonstrate a significant loss of constraint in the elastic-plastic fields ahead of the crack in the wide-plate specimens caused by the inherent negative T-stress of the shallow notch SE(T) configuration. Moreover, the 25mm wide machined notch required for specimen fabrication is shown to further reduce constraint by introducing a traction free surface very near the crack tip. Both of these factors combined to reduce near-tip stresses by 10% below those of the small-scale yielding, SSY (T=O), fields. This reduction places fracture results for the wide-plate specimens within the J-Q toughness locus defined by fracture toughness tests on the A533B material and within the constraint corrected J_c values defined by the toughness scaling methodology.

10021 (SAND–94-1515/1) **Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.** Rosinski, S.T. (ed.) (Sandia National Labs., Albuquerque, NM (United States)); Carter, R.G. (ed.). Sandia National Labs., Albuquerque, NM (United States). Sep 1994. 513p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the Reactor Pressure vessel Thermal Annealing Workshop was to provide a forum for US utilities and interested parties to discuss relevant experience and issues and identify potential solutions/approaches related to: An understanding of the potential benefits of thermal annealing for US commercial reactors; on-going technical research activities; technical aspects of a generic, full-scale, in-place vessel annealing demonstration; and the impact of economic, regulatory, and technical issues on the application of thermalannealingtechnology to US plants. Experts from the international nuclear reactor community were brought together to discuss issues regarding application of thermal annealing technology in the US and identify the steps necessary to commercialize this technology for US reactors. These proceedings contain all presentation materials discussed during the Workshop. Selected papers are indexed separately for inclusion in the Energy Science and Technology Database.

10023 (SAND–94-3101C) **Deliberate ignition of hydrogen-air-steam mixtures under conditions of rapidly condensing steam.** Blanchat, T.; Stamps, D. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research; Sandia National Labs., Albuquerque, NM (United States). Jan 1995. 14p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9410216–6: 22. transactions of the water reactor safety information meeting, Bethesda, MD (United States), 24-26 Oct 1994). Order Number DE95006820. Source: OSTI; NTIS; INIS; GPO Dep.

A series of experiments was conducted to determine hydrogen combustion behavior under conditions of rapidly condensing steam caused by water sprays. Experiments were conducted in the Surtsey facility under conditions that were nearly prototypical of those that would be expected in a severe accident in the CE System 80+ containment. Mixtures were initially nonflammable owing to dilution by steam. The mixtures were ignited by thermal glow plugs when they became flammable after sufficient steam was removed by condensation caused by water sprays. No detonations or accelerated flame propagation was observed in the Surtsey facility. The combustion mode observed for prototypical mixtures was characterized by multiple deflagrations with relatively small pressure rises. The thermal glow plugs were effective in burning hydrogen safely by igniting the gases as the mixtures became marginally flammable.

10024 (JAERI-Research–94-027) **Post irradiation examinations of 87F-2A capsule containing uranium-plutonium mixed carbide fuels.** Arai, Yasuo (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Iwai, Takashi; Sasayama, Tatsuo; Nakajima, Kunihisa; Nomura, Isamu; Yoshida, Takeshi; Suzuki, Yasufumi. Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1994. 71p. (In Japanese). Order Number DE95747886. Source: OSTI; NTIS; INIS.

One fuel pin filled with hyperstoichiometric uranium-plutonium mixed carbide pellets was encapsulated in 87F-2A and irradiated in JMTR up to 4.4 %FIMA at an average linear power of 60 kW/m. The capsule cooled for ≈4 months was transported to Reactor Fuel Examination Facility and subjected to non-destructive and destructive post irradiation examinations. It was found from the radial cross section of fuel pin that the helium gap between the pellets and the cladding tube was completely closed. Compared with the results obtained so far, very low open porosity and fission gas release rate as well as mild restructuring was observed owing to the adoption of thermally stable pellets. The diametric increase of fuel pin reached ≈0.06mm at the position of maximum reading, although it might not affect the fuel performance itself. The inner surface of cladding tube did not show signs of carburization. (author).

10025 (DOE/ER/75886–T1) **Drive reinforcement neural networks for reactor control. Final report.** Williams, J.G.; Jouse, W.C. Arizona Univ., Tucson, AZ (United States). Coll. of Engineering and Mines. [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-93ER75886. Order Number DE95007249. Source: OSTI; NTIS; INIS; GPO Dep.

In view of the loss of the third year funding, the scope of the project goals has been revised. The revision in project scope no longer allows for the detailed modeling of the EBR-11 start-up task that was originally envisaged. The authors are continuing, however, to model the control of the rapid power ascent of the University of Arizona TRIGA reactor using a model-based controller and using a drive reinforcement neural network. These will be combined during the concluding period of the project into a hierarchical control architecture. In addition, the modeling of a PWR feedwater heater has continued, and an autonomous fault-tolerant software architecture for its control has been proposed.

10026 (IAEA-TECDOC–780) **Safety assessment of computerized control and protection systems. Report of a technical committee meeting held in Vienna, 12-16 October 1992.** International Atomic Energy Agency, Vienna (Austria). Dec 1994. 98p. (CONF-9210499–: Technical committee meeting on safety assessment of computerized control and protection systems, Vienna (Austria), 12-16 Oct 1992). Order Number DE95621686. Source: OSTI; NTIS (US Sales Only); INIS.

In developing the views expressed in this document, papers were presented by delegates from Member States. A total of 6 papers were presented in all on topics ranging from applications of computerized control and protection systems in older plants and in new advanced reactors to methods for improving software reliability. In addition two informal presentations were provided by a vendor and a licensing authority. These presentations provided valuable insights into the application of computerized control and protection systems and into the concern of software reliability with proposals for diverse 'backup' systems of different types. This was supplemented by utility and vendor presentations on system designs. Following the presentations, three working groups were formed to produce their views on the licensing of software based safety systems on reliability models and techniques for assessment of computerized safety systems, and on systems considered for computerized upgrading (need, criteria, approach, pitfalls and benefits). This document represents these collected views with the papers presented attached as an annex. Refs, figs and tabs.

10027 (IAEA-TECDOC–780, pp. 31-42) **Finnish activities to develop safety assessment practices for programmable digital systems in nuclear power plants.** Heimbuerger, H. (Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland)); Maskuniitty, M.; Pulkkinen, U. International Atomic Energy Agency, Vienna (Austria). Dec 1994. (CONF-9210499–: Technical committee meeting on safety assessment of computerized control and protection systems, Vienna (Austria), 12-16 Oct 1992). In *Safety assessment of computerized control and protection systems. Report of a technical committee meeting held in Vienna, 12-16 October 1992.* 98p. Order Number DE95621686. Source: OSTI; NTIS (US Sales Only); INIS.

Finnish utility companies Imatran Voima Oy (IVO) and Teollisuuden Voima Oy (TVO) and the licensing authority, the Finnish Centre for Radiation and Nuclear Safety (STUK), are preparing for a new nuclear power plant in Finland. Plant vendors are proposing programmable digital automation systems as well for safety related as for operational I and C systems in this new unit. Also in existing plant units the replacement of certain old analog systems with state-of-the-art digital ones will become necessary in the years to come. Licensing of programmable systems for safety critical applications require a new approach due to the special properties and failure modes of these systems. The major difficulties seem to be in the assessment and quantification of software reliability. The Technical Research Centre of Finland has in co-operation with the authority and the utilities conducted research to develop domestically applicable licensing requirements and practices. International

standards, guidelines, licensing practices, software reliability assessment methods, quality metrics and quantitative methods have been analyzed in order to specify national licensing requirements. The paper will describe and discuss the problems of safety assessment of programmable systems and software of safety systems. Also factors influencing reliability of automation software as well as some of the available reliability assessment methods will be discussed. (author). 16 refs.

10028 (IAEA-TECDOC–780, pp. 53-60) **Safety assessment of computerized control and protection systems.** Andersson, O. (Vattenfall AB, Forsmark, Osthammar (Sweden)); Groenquist, B. International Atomic Energy Agency, Vienna (Austria). Dec 1994. (CONF-9210499–: Technical committee meeting on safety assessment of computerized control and protection systems, Vienna (Austria), 12-16 Oct 1992). In *Safety assessment of computerized control and protection systems. Report of a technical committee meeting held in Vienna, 12-16 October 1992.* 98p. Order Number DE95621686. Source: OSTI; NTIS (US Sales Only); INIS.

Of several reasons computer technology will be more and more considered for use in safety related applications in NPP's. Factory made systems used in many applications have such a reliability and quality level that they may very well meet the requirements for safety applications. Primarily, PLCs (Programmable Logic Controllers) are the type of system that will be considered. Quality and safety assessment of computers for use in safety related systems must follow the same patterns as the ones which are applied for conventional equipment. In this process the proven design criteria and the performance of functional tests must be emphasized. In the design process the usage of established computer design standards (e.g. IEC 880, 987 or the ANSI/ANS 7-4.3.2) is essential. (author).

10029 (IAEA-TECDOC–780, pp. 61-67) **The role of dynamic testing in the certification of software based safety critical systems.** Abott, A. (Rolls Royce and Associates Ltd, Derby (United Kingdom)). International Atomic Energy Agency, Vienna (Austria). Dec 1994. (CONF-9210499–: Technical committee meeting on safety assessment of computerized control and protection systems, Vienna (Austria), 12-16 Oct 1992). In *Safety assessment of computerized control and protection systems. Report of a technical committee meeting held in Vienna, 12-16 October 1992.* 98p. Order Number DE95621686. Source: OSTI; NTIS (US Sales Only); INIS.

The certification of a programmable Safety Critical System can be formed on three basic arguments: (i) Quality in Design; (ii) Quality in Assessment; (iii) Quality in Testing. Quality in design may be achieved and demonstrated by the adoption of appropriate standards. Quality in assessment consists of an independent organization performing an investigation into the Suitability of the Systems for use in a Safety critical application. Quality in testing forms part of the development process and is traditionally concerned with testing aspects of System functionality. In addition dynamic testing may give added confidence that a system will perform in line with its reliability requirements, in a realistic environment. (author).

10030 (IAEA-TECDOC–780, pp. 69-84) **ENEL position on digital control and protection systems for new generation nuclear power plants and related safety implications.** Ghiri, M. (ENEL, Rome (Italy)). International Atomic Energy Agency, Vienna (Austria). Dec 1994. (CONF-9210499–: Technical committee meeting on safety assessment of computerized control and protection systems, Vienna (Austria), 12-16 Oct 1992). In *Safety assessment of computerized control and protection systems. Report of a technical committee meeting held in Vienna, 12-16 October 1992.* 98p. Order Number DE95621686. Source: OSTI; NTIS (US Sales Only); INIS.

The present paper briefly describes the architecture of the C and PS and its safety implications and solutions ENEL intends to adopt in designing the new NPPs. This architecture is based on extended use of Digital Technology and Human Factor techniques, with computerized control rooms provided of software driven work stations, connected to the field through a hierarchical multi-level network system. The same approach is being adopted also for the dual-cycle thermal plants presently under construction and therefore the design of I and C and M-MIS will profit of the experience that will be gained in this field in the coming years. However, despite proper design and operation, software based systems maintain a high vulnerability to latent faults affecting mainly the software. ENEL approach to cope with digital system faults is based on both the principles of high reliability: fault avoidance and fault tolerance. Fault avoidance is pursued mainly by adopting a very systematic and thorough design process, stringent requirements on hardware component reliability and severe and complete software Q and A and V and V. Fault tolerance is pursued by redundancy, segmentation of control and protection functions, physical separation among redundant channels, environmental compatibility. Last but not least, a diverse protection system for the most important prevention and mitigation functions is considered, based on a simple and proven conventional technology. (author). 4 refs, 5 fig, 2 tabs.

10031 (IAEA-TECDOC–780, pp. 85-95) **Experience from licensing and installing programmable electronics in the power range monitoring safety system in the Barsebaeck Nuclear Power Plant.** Andersson, J.O. (Sydsvenska Vaermekraft AB, Loeddekoeping (Sweden). Barsebaeck Nuclear Power Plant). International Atomic Energy Agency, Vienna (Austria). Dec 1994. (CONF-9210499–: Technical committee meeting on safety assessment of computerized control and protection systems, Vienna (Austria), 12-16 Oct 1992). In *Safety assessment of computerized control and protection systems. Report of a technical committee meeting held in Vienna, 12-16 October 1992.* 98p. Order Number DE95621686. Source: OSTI; NTIS (US Sales Only); INIS.

The old electronics were replaced because of reduced availability and problems to obtain spare parts. In 1989 we decided to use a standard industrial programmable equipment (ABB Master) as new electronics. To develop and test the equipment, it was slowly introduced in unit 2 by a three step model. The third step was completed in unit 2 in July 1992, by replacing all electronics. During this three years we had a close dialogue with our internal safety department and several information meetings with the authority SKI in order to address all safety issues. The difficulties to quantify the reliability of software and the importance of operating experience made us decide to have an analog diversification for the most critical safety function. (author).

10032 (INIS-BR–3464) **Numerical simulation of the heating and start-up of PWR nuclear power station.** Faraco-Medeiros, M.A. (PROMON Engenharia SA, Rio de Janeiro, RJ (Brazil)); Leite, C.A.T.; Ramalho, F.P. Associacao Brasileira de Ciencias Mecanicas, Rio de Janeiro, RJ (Brazil). 1992. 4p. (In Portuguese). (CONF-921234–: 4. Brazilian thermal science meeting (ENCIT-92), Rio de Janeiro (Brazil), 1-4 Dec 1992). Order Number DE95621687. Source: OSTI; NTIS (US Sales Only); INIS.

The start-up of a PWR nuclear power plant must be done within safety criteria and requires a simulation. The design of some equipment, cost and time can be optimized. A computer simulator, which allows control of all the equipment and variables into the operation, has been developed and is presented in this paper. The KWU procedure and an alternative for Angra II were simulated. The results are showed up. 09 refs, 03 figs. (B.C.A.).

10033 (INIS-mf–14471, pp. 1-3) **Trends in the applications of artificial neural networks in the nuclear industry.** Boger, Z. (Israel Atomic Energy Commission, Beersheba (Israel). Nuclear Research Center-Negev). Israel Nuclear Society, Yavne (Israel); Israel Radiation Protection Association (Israel); Radiation Research Society of Israel (Israel); Israel Society of Medical Physics (Israel). Israel Nuclear Society, Yavne (Israel). Nov 1994. Sponsored by Technion Research and Development Foundation Ltd., Haifa (Israel);Israel Electricity Co., Tel Aviv (Israel);Israel Atomic Energy Commission, Tel Aviv (Israel);Ministry of Energy and Infrastructure, Jerusalem (Israel). (CONF-9411188–: 1994 joint meeting of the nuclear societies of Israel, Tel Aviv (Israel), 28-29 Nov 1994). In *Transactions of the nuclear societies of Israel Joint meeting 1994.* 234p. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

Artificial Neural Networks are recommended for use in the nuclear industry, for their ability to model complex systems without the need for explicit mathematical equation. However, their use

has been limited by regulatory requirements for verification and validation, and by difficulties in teaching reliable and robust models with limited number of examples. This review of the current trends is based on a literature search in the INIS and INSPEC data bases for publications dated 1993-mid 1994.

(CONF-9411188–: 1994 joint meeting of the nuclear societies of Israel, Tel Aviv (Israel), 28-29 Nov 1994). In *Transactions of the nuclear societies of Israel Joint meeting 1994*. 234p. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

During a transient in a Nuclear Power Plant (NPP), the operator is faced with hundreds of instruments readings, showing some pattern typical of that transient. Assuming that the instruments' readings pattern develops from its steady state condition in a way specific to the transient, we may use this time dependent pattern to identify the transient. Artificial neural networks have proven their capability in solving complex pattern recognition problems, and thus are good candidates for this purpose. There are many different types of artificial neural networks, each one having different properties. One has to consider the various aspects of an artificial neural networks when applying it to a specific application, especially for a safety critical application like NPPs status diagnosis. (authors); 25 refs., 1 tab., 1 fig.

10035 (JAERI-Research–94-026) **FCA containment and surveillance (C/S) system.** Ogawa, Hironobu (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Mukaiyama, Takehiko; Yokota, Yasuhiro. Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1994. 211p. (In Japanese). Order Number DE95747900. Source: OSTI; NTIS; INIS.

The Fast Critical Assembly (FCA) facility of the Japan Atomic Energy Research Inst. (JAERI) is internationally recognized as one of the most sensitive facility in the world from the viewpoint of international safeguards, because the facility possesses a large amount of metallic uranium and metallic plutonium, which are needed to perform various physical experiments. These material are subject to frequent verifications by the inspectorate, the International Atomic Energy Agency (IAEA) and the domestic authority (Science and Technology Agency of Japan, STA). Those verifications require inspectors to access to these materials for measurements and applications of seals. Human resources increase of irradiations and restrictions on the freedom of physical experiments, that are inevitably associated with these inspection activities, have been a serious problem that causes significant burdens for all relating parties. To decrease these burdens without any confliction with the inspection goals, an advanced comprehensive system of containment and surveillance has been developed. The FCA Containment and Surveillance (C/S) System consists of tow independent subsystems, i. e. Portal Monitor (P/M) and Penetration Monitor(PN/M). In this system the internal wall of the reactor building is used as a part of containment for the safeguards purpose, which enables the portal, that is installed at the internal wall of the reactor building, to be used as an area for monitoring of any removal of nuclear material. A metal detector of high sensitivity has been selected for the system since all nuclear materials possessed by the FCA has metallic forms. The internal wall has several penetrations for utility purposes, which should also be monitored for the purpose of detecting any removal of nuclear material from the reactor core area. A penetration monitor system has been developed for this purpose. This report describes functions of the system and their operation procedures. (author).

10036 (NUREG/CR–6291-Vol.4) **Nuclear plant analyzer - programmer's manual.** Snider, D.M.; Wagner, K.L.; Grush, W.H.; Jones, K.R. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Technology; Idaho National Engineering Lab., Idaho Falls, ID (United States). Jan 1995. 186p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. (INEL–94/0123-Vol.4). Source: OSTI; NTIS; INIS; GPO.

The Nuclear Plant Analyzer (NPA) system provides both a highly flexible graphical user interface for displaying simulation data and, where applicable, a convenient means of interactively controlling the host program through user-defined pop-up menus. The NPA system was developed at the Idaho National Engineering Laboratory under the sponsorship of the US Nuclear Regulatory Commission (NRC). This manual is intended to serve as a programmer's guide for the NPA system. As such, it includes technical details regarding the design and implementation of the Computer Visuals Systems (CVS) program, the Analyzer, data files used by CVS and the Analyzer, and a series of auxiliary programs that provide important services to NPA users.

10037 **Dual annular rotating "windowed" nuclear reflector reactor control system.** Jacox, M.G.; Drexler, R.L.; Hunt, R.N.M.; Lake, J.A. To Dept. of Energy. 1992. Filed date 28 Oct 1992. U.S. Patent Application 7-967,504. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE95006133. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A nuclear reactor control system is provided in a nuclear reactor having a core operating in the fast neutron energy spectrum where criticality control is achieved by neutron leakage. The control system includes dual annular, rotatable reflector rings. There are two reflector rings: an inner reflector ring and an outer reflector ring. The reflectors are concentrically assembled, surround the reactor core, and each reflector ring includes a plurality of openings. The openings in each ring are capable of being aligned or non-aligned with each other. Independent driving means for each of the annular reflector rings is provided so that reactor criticality can be initiated and controlled by rotation of either reflector ring such that the extent of alignment of the openings in each ring controls the reflection of neutrons from the core.

10038 (DOE/EIS–0161IP-Rev.) **Implementation plan: Tritium supply and recycling programmatic environmental impact statement. Revised.** USDOE Assistant Secretary for Defense Programs, Washington, DC (United States). Office of Reconfiguration. Jan 1995. 302p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006866. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) is proposing to address the siting of and technology for tritium supply and recycling facilities for the Nation's Nuclear Weapons Complex (Complex). Tritium, a radioactive isotope of hydrogen, is used to enhance the performance of nuclear weapons and is a necessary component for all weapons in the stockpile. Tritium decays at 5.5% per year and must be replaced periodically as long as the Nation relies on a nuclear deterrent. Currently, there is no capability to produce tritium within the Complex, yet projections require that new tritium be available by approximately 2011. Therefore, the Tritium Supply and Recycling Programmatic Environmental Impact Statement will evaluate the alternatives for the siting, construction, and operation of tritium supply and recycling facilities at each of five candidate sites: the Idaho national Engineering Laboratory (INEL), Nevada Test Site (NTS), Oak Ridge Reservation (ORR), the Pantex Plant, and the Savannah River Site (SRS). The PEIS will assess the environmental impacts of all reasonable alternatives.

10039 (IAE–2094/E-III/R/B) **Complex analysis of hazards to the man and natural environment due to electricity production in nuclear and coal power plants.** Strupczewski, A. Institute of Atomic Energy, Otwock-Swierk (Poland). 1990. 86p. (In Polish). Order Number DE95618252. Source: OSTI; NTIS; INIS.

The report presents a complex analysis of hazards connected with electrical energy production in nuclear power plants and coal

power plants, starting with fuel mining, through power plant construction, operation, possible accidents and decommissioning to long term global effects. The comparison is based on contemporary, proven technologies of coal fired power plants and nuclear power plants with pressurized water reactors. The hazards to environment and man due to nuclear power are shown to be much smaller than those due to coal power cycle. The health benefits due to electrical power availability are shown to be much larger than the health losses due to its production. (author). 71 refs, 17 figs, 12 tabs.

10040 (IG–93-01) **The tritium content of precipitation and surface water in Austria in 1992.** Rank, D.; Rajner, V.; Lust, G. Bundesversuchs- und Forschungsanstalt Arsenal, Vienna (Austria). 1993. 36p. (In German). Order Number DE95621234. Source: OSTI; NTIS (US Sales Only); INIS.

This report includes weighted monthly ^{3}H-means from 23 precipitation sampling stations, ^{3}H-concentrations of daily precipitation samples from the station Wien-Arsenal, and ^{3}H-concentrations of monthly samples from 17 surface water sampling stations. (authors).

10041 (IG–94-01) **The tritium content of precipitation and surface water in Austria in 1993.** Rank, D.; Rajner, V.; Lust, G. Bundesversuchs- und Forschungsanstalt Arsenal, Vienna (Austria). 1994. 36p. (In German). Order Number DE95621235. Source: OSTI; NTIS (US Sales Only); INIS.

This report includes weighted monthly ^{3}H-means from 24 precipitation sampling stations, ^{3}H-concentrations of daily precipitation samples from the station Wien-Arsenal, and ^{3}H-concentrations of monthly samples from 17 surface water sampling stations. (authors).

10042 (K/D–5695) **Computer programs for developing source terms for a UF_6 dispersion model to simulate postulated UF_6 releases from buildings.** Williams, W.R. Oak Ridge Gaseous Diffusion Plant, TN (United States). Mar 1985. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OT21400. Order Number DE95006360. Source: OSTI; NTIS; GPO Dep.

Calculational methods and computer programs for the analysis of source terms for postulated releases of UF_6 are presented. Required thermophysical properties of UF_6, HF, and H_2O are described in detail. UF_6 reacts with moisture in the ambient environment to form HF and H_2O. The coexistence of HF and H_2O significantly alters their pure component properties, and HF vapor polymerizes. Transient compartment models for simulating UF_6 releases inside gaseous diffusion plant feed and withdrawl buildings and cascade buildings are also described. The basic compartment model mass and energy balances are supported by simple heat transfer, ventilation system, and deposition models. A model that can simulate either a closed compartment or a steady-state ventilation system is also discussed. The transient compartment models provide input to an atmospheric dispersion model as output.

10043 (PNL–4858) **N Reactor thermal plume characterization during Pu-only mode of operation.** Ecker, R.M.; Thompson, F.L.; Whelan, G. Pacific Northwest Lab., Richland, WA (United States). Apr 1983. 235p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95006513. Source: OSTI; NTIS; GPO Dep.

Pacific Northwest Laboratories (PNL) performed field and modeling studies -from March 1982 through June 1983 to characterize the thermal plume from the N Reactor heated water outfall while the N Reactor operated in the Pu-only mode. Part 1 of this report deals with the field studies conducted to characterize the N Reactor thermal plume while in the Pu-only mode of operation. It includes a description of the study area, a description of field tasks and procedures, and data collection results and discussion. Part 2 describes the computer simulation of the thermal plume under different flow conditions and the calibration of the model used. It includes a description of the computer model and the assumptions on which it is based, a presentation of the input data used in this application, and a discussion of modeling results. Because the field studies were restricted by the NPOES permit variance to the spring months when high Columbia River flows prevail the mathematical modeling of the N Reactor thermal plume while the reactor operates in the Pu-only mode is instrumental in characterizing the plume during low Columbia River flows.

10044 (PNL-SA–23899) **Radioactive effluent measurements at the Army Pulse Radiation Facility.** Scherpelz, R.I.; Glissmeyer, J.A. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941102–38: Winter meeting of the American Nuclear Society, Washington, DC (United States), 13-18 Nov 1994). Order Number DE95007158. Source: OSTI; NTIS; INIS; GPO Dep.

Staff from the Pacific Northwest Laboratory (PNL) performed measurements of the radioactive effluents emitted by the Army Pulse Radiation Facility (APRF). These measurements were performed by collecting the cooling air that passed by the APRF reactor as it operated, passing the air through filters to collect the particulates and iodines, and collecting samples of the air to be analyzed for noble gases. The reactor operated for four test runs, including two pulses and two steady state runs. After each reactor run, the filters were counted using gamma spectrometry to identify the nuclides and to determine the activity of nuclides deposited on the filters. The study provided radionuclide release fraction data that can be used to estimate the airborne emissions resulting from APRF operations. The release fraction for particulate fission products and radioiodines, as derived from these measurements, was found to be 8.9×10^{-6} for reactor pulses and 4.3×10^{-6} for steady state operation. These values compare to a theoretical value of 1.5×10^{-5}.

10045 (SSI–94-12) **Monitoring of radionuclides in the terrestrial and aquatic environment of the nuclear power plant at Barsebaeck (Sweden) for the period 1984-1991.** Neumann, G. (Swedish Univ. of Agricultural Sciences, Uppsala (Sweden). Dept. of Radioecology). Swedish Radiation Protection Inst., Stockholm (Sweden). 15 Nov 1994. 73p. (In Swedish). Order Number DE95620184. Source: OSTI; NTIS; INIS.

This report summarizes the main results from the environment monitoring sampling for the years 1984-1991 around the nuclear power plant at Barsebaeck, southern Sweden. The sampling are required according to the environment monitoring programme which has been decided upon by the Swedish Radiation Protection Inst. Terrestrial samples include cultivated plants, natural vegetation, milk, some other foods of animal origin and sludge. From the aquatic environment, samples of sea water, bottom sediments, benthic fauna, algae and fish are collected. This report accounts for all samples that have been measured during the period 1984-1991. The diagrams also include data from the years 1981-1983. The annual discharge to air and to water resulted during the years 1984-1991 in a dose commitment to a critical group which generally amounted to less than 2 micro-sievert (which equals 2 per cent of the maximum permitted, viz. one Norm release). The annual radiation dose outside the power plant has always been found less than 0.2% of that from the background radiation. Outside the plant, only very small quantities of radionuclides were detected which could be related to its operation. Radionuclides from the power plant have not with certainty been detected in cultivated plants, milk, and meat produced in the vicinity of the power plant. On the other hand small quantities of Co-60 and Zn-65 from the plant were detected in, for instance, some samples of eel and cod from stations close to the plant. In 1985 and 1989, special sediment sampling were carried out at 12 stations off Barsebaeck. One aim was to investigate whether any accumulation of radionuclides from Barsebaeck in bottom sediments had occurred during the period. There was no clear evidence of any such accumulation. 15 refs, 22 figs, 16 tabs.

10046 (UCRL-JC–116477) **The role of the LLNL Atmospheric Release Advisory Capability in a FRMAC response to a nuclear power plant incident.** Baskett, R.L. (EG and G Energy Measurements, Inc., Pleasanton, CA (United States)); Sullivan, T.J.; Ellis, J.S.; Foster, C.S. Lawrence Livermore National Lab., CA (United States). [1994]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ; AC08-93NV11265. (CONF-9410292–1: Nuclear Utilities Meteorological Users Group workshop, Charlotte, NC (United States), 19-21 Oct

1994). Order Number DE95004968. Source: OSTI; NTIS; INIS; GPO Dep.

The Federal Radiological Emergency Response Plan (FRERP) can provide several emergency response resources in response to a nuclear power plant (NPP) accident if requested by a state or local agency. The primary FRERP technical resources come from the US Department of Energy's (DOE) Federal Radiological Monitoring and Assessment Center (FRMAC). Most of the FRMAC assets are located at the DOE Remote Sensing Laboratory (RSL) at Nellis Air Force Base, Las Vegas, Nevada. In addition, the primary atmospheric dispersion modeling and dose assessment asset, the Atmospheric Release Advisory Capability (ARAC) is located at Lawrence Livermore National Laboratory (LLNL) in Livermore, California. In the early stages of a response, ARAC relies on its automatic worldwide meteorological data acquisition via the Air Force Global Weather Center (AFGWC). The regional airport data are supplemented with data from on-site towers and sodars and the National Oceanographic & Atmospheric Administration's (NOAA) field-deployable real-time rawinsonde system. ARAC is prepared with three-dimensional regional-scale diagnostic dispersion model to simulate the complex mixed fission product release from a reactor accident. The program has been operational for 18 years and is presently developing its third generation system. The current modernization includes faster central computers, a new site workstation system. The current modernization includes faster central computers, a new site workstation system, improvements in its diagnostic dispersion models, addition of a new hybrid-particle source term, and implementation of a mesoscale prognostic model. AS these new capabilities evolve, they will be integrated into the FRMAC's field-deployable assets.

10047 (WSRC-MS–94-0406) **A comparative study of worker and general public risks from nuclear facility operation using MACCS2.** East, J.M.; O'Kula, K.R. Westinghouse Savannah River Co., Aiken, SC (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950420–2: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 may 1995). Order Number DE95000529. Source: OSTI; NTIS; INIS; GPO Dep.

Over the last five years, the US Department of Energy (DOE) has attempted to establish quantitative risk indices as minimum acceptance criteria for assurance of safe operation of its nuclear facilities. The risk indices serve as aiming points or targets to include consideration of all aspects of operation including normal conditions as well as abnormal, design basis events, and beyond-design basis events. Although initial focus of the application of these safety targets had been on DOE's reactors, more recent assessments have also considered non-reactor facilities including those encompassing storage and nuclear processing activities. Regardless of the facility's primary function, accident progression, event tree/fault tree logic models, and probabilistic (dose) consequence assessment model must be implemented to yield a fully integrated analysis of facility operation. The primary tool for probabilistic consequence assessment in the US is the MELCOR Accident Consequence Code System (MACCS). In this study, two version of MACCS are applied to representative source terms developed in the safety analysis associated with a waste processing facility at the Westinghouse Savannah River Company's (WSRC's) Savannah River Site (SRS). The MACCS versions are used to estimate population dose and subsequent health effects to workers and the general public from the SRS referenced facility operation. When combined with the frequency of occurrence evaluation, the margin of compliance with the safety targets may be quantified.

10048 (ANL/TD/CP–85126) **Neutronic study on conversion of SAFARI-1 to LEU silicide fuel.** Ball, G. (Atomic Energy Corp. of South Africa Ltd., Pretoria (South Africa)); Pond, R.; Hanan, N.; Matos, J. Argonne National Lab., IL (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9409107–12: International meeting on reduced enrichment for research and test reactors, Williamsburg, VA (United States), 18-22 Sep 1994). Order Number DE95007084. Source: OSTI; NTIS; INIS; GPO Dep.

This paper marks the initial study into the technical and economic feasibility of converting the SAFARI-1 reactor in South Africa to LEU silicide fuel. Several MTR assembly geometries and LEU uranium densities have been studied and compared with MEU and HEU fuels. Two factors of primary importance for conversion of SAFARI-1 to LEU fuel are the economy of the fuel cycle and the performance of the incore and excore irradiation positions.

10049 (ANL/TD/CP–85128) **Transient analyses and thermal-hydraulic safety margins for the Greek Research Reactor (GRRI).** Woodruff, W.L. (Argonne National Lab., IL (United States)); Deen, J.R.; Papastergiou, C. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9409107–9: International meeting on reduced enrichment for research and test reactors, Williamsburg, VA (United States), 18-22 Sep 1994). Order Number DE95007088. Source: OSTI; NTIS; INIS; GPO Dep.

Various core configurations for the Greek research reactor (GRR1) have been considered in assessing the safety issues of adding a beryllium reflector to the existing water reflected HEU core and the transition from HEU to an all LEU core. The assessment has included both steady-state and transient analyses of safety margins and limits. A small all fresh Be reflected HEU core with a rather large nuclear peaking factor can still be operated safely, and thus adding a Be reflector to the larger depleted HEU core should not pose a problem. The transition mixed core with 50% LEU elements has larger void and Doppler coefficients than the HEU reference core and gives a lower peak clad temperature under transient conditions. The transition cores should give ever increasing margins to plate melting and fission product release as LEU elements are added to the core.

10050 (ANL/TD/CP–85129) **Status of the US RERTR Program.** Travelli, A. Argonne National Lab., IL (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9409107–10: International meeting on reduced enrichment for research and test reactors, Williamsburg, VA (United States), 18-22 Sep 1994). Order Number DE95007087. Source: OSTI; NTIS; INIS; GPO Dep.

The progress of the Reduced Enrichment Research and Test Reactor (RERTR) Program is described. The major events, findings, and activities of 1994 are reviewed after a brief summary of the results which the RERTR Program had achieved by the end of 1993 in collaboration with its many international partners. The RERTR Program has moved aggressively to support President Clinton's nonproliferation policy and his goal "to minimize the use of highly-enriched uranium in civil nuclear programs". An Environmental Assessment which addresses the urgent-relief acceptance of 409 spent fuel elements was completed, and the first shipment of spent fuel elements is scheduled for this month. An Environmental Impact Statement addressing the acceptance of spent research reactor fuel containing enriched uranium of U.S. origin is scheduled for completion by the end of June 1995. The U.S. administration has decided to resume development of high-density LEU research reactor fuels. DOE funding and guidance are expected to begin soon. A preliminary plan for the resumption of fuel development has been prepared and is ready for implementation. The scope and main technical activities of a plan to develop and demonstrate within the next five years the technical means needed to convert Russian-supplied research reactors to LEU fuels was agreed upon by the RERTR Program and four Russian institutes lead by RDIPE. Both Secretary O'Leary and Minister Michailov have expressed strong support for this initiative. Joint studies have made significant progress, especially in assessing the technical and economic feasibility of using reduced enrichment fuels in the SAFARI-I reactor in South Africa and in the Advanced Neutron Source reactor under

design at ORNL. Significant progress was achieved on several aspects of producing ^{99}Mo from fission targets utilizing LEU instead of HEU to the achievement of the common goal.

10051 (BNL–61086) **Rebuilding the Brookhaven high flux beam reactor: A feasibility study.** Brynda, W.J.; Passell, L.; Rorer, D.C. Brookhaven National Lab., Upton, NY (United States). [1995]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95005691. Source: OSTI; NTIS; INIS; GPO Dep.

After nearly thirty years of operation, Brookhaven's High Flux Beam Reactor (HFBR) is still one of the world's premier steady-state neutron sources. A major center for condensed matter studies, it currently supports fifteen separate beamlines conducting research in fields as diverse as crystallography, solid-state, nuclear and surface physics, polymer physics and structural biology and will very likely be able to do so for perhaps another decade. But beyond that point the HFBR will be running on borrowed time. Unless appropriate remedial action is taken, progressive radiation-induced embrittlement problems will eventually shut it down. Recognizing the HFBR's value as a national scientific resource, members of the Laboratory's scientific and reactor operations staffs began earlier this year to consider what could be done both to extend its useful life and to assure that it continues to provide state-of-the-art research facilities for the scientific community. This report summarizes the findings of that study. It addresses two basic issues: (i) identification and replacement of lifetime-limiting components and (ii) modifications and additions that could expand and enhance the reactor's research capabilities.

10052 (CONF-9407103–34) **Materials considerations for molten salt accelerator-based plutonium conversion systems.** DeVan, J.H.; DiStefano, J.R.; Eatherly, W.P.; Keiser, J.R.; Klueh, R.L. Oak Ridge National Lab., TN (United States). [1994]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International conference on accelerator-driven transmutation technologies and applications; Las Vegas, NV (United States); 25-28 Jul 1994. Order Number DE95006743. Source: OSTI; NTIS; INIS; GPO Dep.

A Molten-Salt Reactor Program for power applications was initiated at the Oak Ridge National Laboratory in 1956. In 1965 the Molten Salt Reactor Experiment (MSRE) went critical and was successfully operated for several years. Operation of the MSRE revealed two deficiencies in the Hastelloy N alloy that had been developed specifically for molten-salt systems. The alloy embrittled at elevated temperatures as a result of exposure to thermal neutrons (radiation damage) and grain boundary embrittlement occurred in materials to fuel salt. Intergranular cracking was found to be associated with fission products, viz. tellurium. An improved Hastelloy N composition was subsequently developed that had better resistance to both of these problems. However, the discovery that fission product cracking could be significantly decreased by making the salt sufficiently reducing offers the prospect of improved compatibility with molten salts containing fission products and resistance to radiation damage in ABC applications. Recommendations are made regarding the types of corrosion tests and mechanistic studies needed to qualify materials for operation with PuF_3-containing molten salts.

10053 (CONF-9409107–8) **Studies of the impact of fuel enrichment on the performance of the advanced neutron source reactor.** West, C.D. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International meeting on reduced enrichment for research and test reactors; Williamsburg, VA (United States); 18-22 Sep 1994. Order Number DE95005395. Source: OSTI; NTIS; INIS; GPO Dep.

As part of a larger study involving several organizations, the Advanced Neutron Source (ANS) Project made performance calculations for 19 different combinations of reactor core volume, fuel density and enrichment, power level, and other relevant parameters. These calculations were performed by Idaho National Engineering Laboratory (INEL) and Oak Ridge National Laboratory (ORNL). Subsequently, ORNL analyzed 14 other cases. With the aid of data from these 33 cases, the laboratory has been able to correlate the most important performance characteristics (peak thermal flux in the reflector and core life) with fuel enrichment, fuel density, and power. The correlations permits the investigation of additional cases without going to the expense of doing completely new neutronics calculations for each new one and can be used to prepare curves showing the effects of different enrichments and of different fuel densities within the entire range from existing technology to the very advanced, as yet undeveloped fuels that have been proposed from time to time.

10054 (CONF-950445–1) **Static-flow-instability in subcooled flow boiling in wide rectangular parallel channels.** Siman-Tov, M.; Felde, D.K.; McDuffee, J.L.; Yoder, G.L. Jr. Oak Ridge National Lab., TN (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 2. international conference on multiphase flow; Kyoto (Japan); 3-7 Apr 1995. Order Number DE94019324. Source: OSTI; NTIS; GPO Dep.

The Advanced Neutron Source (ANS) is a state-of-the-art research reactor facility that will be built at the Oak Ridge National Laboratory (ORNL) and is designed to become the world's most advanced thermal neutron flux source for scientific experiments. Therefore, the core of the ANS reactor (ANSR) must be designed to accommodate very high power densities using very high coolant mass fluxes and subcooling levels, The nominal average and peak heat fluxes in the ANSR are approximately 6 and 12 MW/M^2, respectively, with a nominal total thermal power of 303 MW. Highly subcooled heavy-water coolant (1.7 MPa and 85°C at the core exit) flows vertically upward at a very high mass flux of almost 27 Mg/M^2-s. The cooling channels in each fuel assembly are all parallel and share common inlet and outlet plenums, effectively imposing a common pressure drop across all the channels. This core configuration is subject to flow excursion (FE) and/or flow instability that may occur once boiling is initiated in any one of the channels. The FE phenomenon constitutes a different thermal limit than a true critical heat flux (CHF) or departure from nucleate boiling (DNB). In such a system, initiation of boiling in one of the channels (i.e., the hot channel) can result in flow redistribution to the other cooler channels. This report details testing to document this phenomenon.

10055 (DOE/ER/12974–2) **NCSU PULSTAR reactor instrumentation upgrade. Final technical report, September 6, 1990–March 19, 1993.** Bilyj, S.J.; Perez, P.B. North Carolina State Univ., Raleigh, NC (United States). Dept. of Nuclear Engineering. 1 Nov 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER12974. Order Number DE95006416. Source: OSTI; NTIS; INIS; GPO Dep.

The Nuclear Reactor Program at North Carolina State University initiated an upgrade program at the NCSU PULSTAR Reactor in 1990. Twenty-year-old instrumentation is currently undergoing replacement with solid-state and current technology equipment. The financial assistance from the United States Department of Energy has been the primary source of support. This report provides the status of the first two phases of the upgrade program.

10056 (DPSPU–64-30-16) **Cobalt-60 production at Savannah River.** Allen, H.F. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Plant. [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (CONF-640534–1: American Nuclear Society (ANS) process radiation meeting, Washington, DC (United States), 13 May 1964). Order Number DE95006362. Source: OSTI; NTIS; GPO Dep.

Over the past 8 or 9 years, the Savannah River Plant (SRP) has produced close to 4 million curies of cobalt-60 by irradiating cobalt-59 in the production reactors. This paper reviews past and current irradiations, cobalt-60 production methods, and costs.

10057 (DPW–54-19-5-Del.Ver.) **Flat bonded fuel elements: Report No. 5, February 11–April 10, 1954.** Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Atomic Energy Div. [1954]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–838). Order Number DE95002312. Source: OSTI; NTIS; GPO Dep.

This report details activities in the Flat Bonded Fuel Element Program for the period of February 11, 1954 through April 10, 1954.

10058 (DPW–54-19-7-Del.Ver.) **Flat bonded fuel elements: Report No 7, June 11, 1954–August 10, 1954.** Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Atomic Energy Div. [1954]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–856). Order Number DE95002434. Source: OSTI; NTIS; GPO Dep.

This report details activities in the Flat Bonded Fuel Element program for the period of June 11, 1954 through August 10, 1954.

10059 (DPW–56-257) **Design data summary: Mark VIA fuel elements.** Babcock, D.F.; Woodhouse, J.C. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 1 Jun 1956. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–819). Order Number DE95000947. Source: OSTI; NTIS; GPO Dep.

This report provides workable summary of the technical information developed to date for the Mark VIA fuel element. The report provides a satisfactory compilation of information for use as a basis for designing facilities for a production process.

10060 (DUN–525-28) **Status of irradiations performed by testing and irradiation services for BNW as of September 15, 1968.** Barker, L.V. Douglas United Nuclear, Inc., Richland, WA (United States). 23 Sep 1968. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95006544. Source: OSTI; NTIS; GPO Dep.

This report itemizes the irradiations performed by Testing and Irradiation Services for Battelle-Northwest. It lists the material being irradiated, awaiting disposition and material shipped during the report period.

10061 (ENEA-RT-INN–94-07) **Trine experimental program and materials characterization.** Alvani, C. (ENEA, Casaccia (Italy). Area Energia e Innovazione); Casadio, S.; Nannetti, C.A. ENEA, Casaccia (Italy). Area Energia e Innovazione. Mar 1994. 13p. (CONF-9309299–2: 2. international workshop on ceramic breeder blanket interactions, Paris (France), 22-24 Sep 1993; RT/INN–94-07). Order Number DE95749673. Source: OSTI; NTIS (US Sales Only).

An irradiation experiment (90 FPD in SILOE reactor) has been conceived in order to evaluate the effect of redox power of helium sweeping gas with 100 vpm hydrogen additive (varying the H2/H20 ratio) on both: - tritium removing rate from LiA102 (ENEA-Italian Agency for New Technologies, Energy and the Environment) and Li2Zro3 (CEA-Commissariat l'Energie Atomique, Grenoble, (FR)); - tritium permeating through AISI-316L SS tube walls. The conditions and materials explored are significant to support the 'breeder inside tube' (BIT) blanket concept development.

10062 (HDC–2513) **Permissible design pressures for 2S-H14-72S clad process tubes.** Elder, B.R. Hanford Works, Richland, WA (United States). 3 Mar 1952. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95007522. Source: OSTI; NTIS; GPO Dep.

The following are the maximum recommended design pressures when using 2S-H14-72S clad process tubes: (a) long duration (Operating Pressure) - 500 psi at tube entry. (b) Short duration (Emergency Pressure) - 600 psi at any point along tube length. (c) If several distoration of some tubes (as of fringe tubes in older piles) is expected the operating pressure limit of the tubes in question should be lowered to compensate for the expected distortion.

10065 (INIS-mf–14437-Vol.4) **Vol. 4: Technical descriptions of Czechoslovak research reactors. Part 2. Technical description of the LR-0 reactor.** Bezpecnost Jadernych Zarizeni, no.4. Matejka, K. (ed.) (Ceske Vysoke Uceni Technicke, Prague (Czech Republic). Fakulta Jaderna a Fysikalne Inzenyrska); Fleischhans, J.; Hejzlar, R. No corporate text available. Jun 1994. 449p. (In Czech). Order Number DE95618906. Source: OSTI; NTIS (US Sales Only); INIS.

The LR-0 research reactor operated by the Nuclear Research Institute in Rez is described. Particular attention is devoted to the reactor design. Described are the main and auxiliary moderator circuits and reactor control and protection systems, especially the control equipment, means to identify the reactor status, means for information processing and contact with the operators, means for controlling the neutron flux density, feed system, and experimental equipment. The dosimetric protection of the workplace is also dealt with. The design of the reactor core, of the technological circuits and control equipment makes it possible to perform physical experiments on WWER-1000 type cores over a wide region of numbers of assemblies, various degrees of fuel enrichment, arrangements of clusters in the reactor core, boric acid concentrations in moderator, etc. Physical measurements on light-water lattices of the WWER-440 type, studies of physical problems of shielding, investigation into spent fuel problems, and addressing nuclear safety problems are also possible. (J.B.). 7 figs., 3 refs.

10066 (INIS-mf–14437-Vol.5) **Vol. 5: Research reactor safety and operation.** Bezpecnost Jadernych Zarizeni, no.4. Matejka, K. (ed.) (Ceske Vysoke Uceni Technicke, Prague (Czech Republic). Fakulta Jaderna a Fysikalne Inzenyrska); Fleischhans, J.; Hejzlar, R. No corporate text available. Jun 1994. 449p. (In Czech). Order Number DE95618905. Source: OSTI; NTIS (US Sales Only); INIS.

A commentary is presented on the State Surveillance over Nuclear Safety of Nuclear Facilities Act No. 28/1984 and the follow-up Decree of the Czechoslovak Atomic Energy Commission No. 9/ 1985. Requirements placed on safety reports for the construction, commissioning and start-up of nuclear facilities are given. The quality assurance and facility qualification topics are dealt with. The requirements put on performing the basic critical experiment are specified. General and particular procedures in case of radiation and non-radiation accidents are described with emphasis on the LVR-15, LR-0 and VR-1 research reactors. Requirements concerning the operating documentation and organization of operation of these reactors are given. Attention is also paid to radioactive material and waste handling principles and to radiation safety of facilities comprising nuclear reactors. (J.B.). 4 tabs., 28 refs.

10067 (INIS-mf–14471, pp. 9-10) **Energy production in a thorium subcritical lattice driven by accelerated protons.** Segev, M. (Ben-Gurion Univ. of the Negev, Beersheba (Israel). Dept. of Nuclear Engineering). Israel Nuclear Society, Yavne (Israel); Israel Radiation Protection Association (Israel); Radiation Research Society of Israel (Israel); Israel Society of Medical Physics (Israel). Israel Nuclear Society, Yavne (Israel). Nov 1994. Sponsored by Technion Research and Development Foundation Ltd., Haifa (Israel);Israel Electricity Co., Tel Aviv (Israel);Israel Atomic Energy Commission, Tel Aviv (Israel);Ministry of Energy and Infrastructure, Jerusalem (Israel). (CONF-9411188–: 1994 joint meeting of the nuclear societies of Israel, Tel Aviv (Israel), 28-29 Nov 1994). In *Transactions of the nuclear societies of Israel Joint meeting 1994*. 234p. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

It has been proposed to sustain a thorium fuel cycle in a tight lattice driven by spallation reactions neutrons, these reactions being initiated by bombarding the lattice with high- energy, high-current, protons. The proposal lacks a consistent evolution calculation of actinides and fission product densities. In order to assess the true potential of the concept, the capacity of a criticality burnup calculation with the WIMS code was tested as a replacement to a source-driven' burnup calculation. Tests of 'source-driven' burnup were conducted with calculations based on a package program combining the high-energy code HETC, the Monte-Carlo code MCNP, and the depletion code KORIGEN. (author). 2 refs., 1 tab.

10068 (INIS-mf–14471, pp. 16-17) **Feynman-alpha measurements at Ben-Gurion University's subcritical assembly.** Shaham, Y. (Israel Atomic Energy Commission, Beersheba (Israel). Nuclear Research Center-Negev); Yaar, I.; Birenbaum, Y.; Berant, Z.; Haran, O.; Shahal, O. Israel Nuclear Society, Yavne (Israel); Israel Radiation Protection Association (Israel); Radiation Research Society of Israel (Israel); Israel Society of Medical Physics (Israel). Israel Nuclear Society, Yavne (Israel). Nov 1994. Sponsored by Technion Research and Development Foundation Ltd., Haifa (Israel);Israel Electricity Co., Tel Aviv (Israel);Israel Atomic Energy Commission, Tel Aviv (Israel);Ministry of Energy and Infrastructure, Jerusalem (Israel). (CONF-9411188–: 1994 joint meeting of the nuclear societies of Israel, Tel Aviv (Israel), 28-29 Nov 1994). In *Transactions of the nuclear societies of Israel Joint meeting 1994.* 234p. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

Feynman-Alpha is a reactor-noise technique for measuring reactor parameters. This method consists of placing a detector and a continuous source in a multiplying medium and measuring a statistical property of the detector counts, namely the ratio of variance to mean in a definite time interval (the statistics differs from the Poisson distribution because of the correlations between neutrons produced by a common fission). By evaluating this property for several time intervals it is possible to deduce the decay constant alpha. (authors). 4 refs.

10069 (INIS-mf–14471, pp. 18-23) **IRR-1 moderator temperature coefficient of reactivity at two different core configurations.** Bettan, M. (Israel Atomic Energy Commission, Yavne (Israel). Soreq Nuclear Research Center); Silverman, I.; Shapira, M.; Nagler, A. Israel Nuclear Society, Yavne (Israel); Israel Radiation Protection Association (Israel); Radiation Research Society of Israel (Israel); Israel Society of Medical Physics (Israel). Israel Nuclear Society, Yavne (Israel). Nov 1994. Sponsored by Technion Research and Development Foundation Ltd., Haifa (Israel);Israel Electricity Co., Tel Aviv (Israel);Israel Atomic Energy Commission, Tel Aviv (Israel);Ministry of Energy and Infrastructure, Jerusalem (Israel). (CONF-9411188–: 1994 joint meeting of the nuclear societies of Israel, Tel Aviv (Israel), 28-29 Nov 1994). In *Transactions of the nuclear societies of Israel Joint meeting 1994.* 234p. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

Experiments designed to measure the effect of coolant moderator temperature on core reactivity in an high enrichment uranium swimming pool type reactor were performed. The moderator temperature coefficient of reactivity α_w was obtained and found to be different in two core loadings. The measured a.w of one core loading was -13 pcm/degree C at the temperature range of 23-30 degree C. This value of α_w is comparable to the data published by the IAEA. The α_w measured in the second core loading was found to be -8 pcm/degree C at the same temperature range. The results were used in a core simulation utilizing the Dynamic Simulator for Nuclear Power Plants. (authors). 4 refs., 5 figs.

10070 (JAERI-Research–94-017) **Irradiation experiments of the 6th-12th OGL-1 fuel assemblies.** Hayashi, Kimio (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Minato, Kazuo; Kobayashi, Fumiaki; Kikuchi, Hironobu; Fukuda, Kousaku; Kikuchi, Teruo; Saruta, Tohru; Kitajima, Toshio. Japan Atomic Energy Research Inst., Tokyo (Japan). Oct 1994. 258p. (In Japanese). Order Number DE95747890. Source: OSTI; NTIS; INIS.

The Oarai Gas Loop-1, OGL-1, is an in-pile helium gas loop, installed in the Japan Materials Testing Reactor (JMTR), for irradiation of high-temperature gas-cooled reactor fuels at high pressure and temperature. The present report describes results of fabrication, irradiation and post-irradiation examinations (PIE) of the 6th-12th OGL-1 fuel assemblies. The 6th-8th assemblies used coated fuel particles produced by a small-scale fluidized bed. On the other hand, the 9th-12th assemblies used trial manufacturing fuels, produced with a large-scale fluidized bed for mass production of the fuel for the High Temperature Engineering Test Reactor (HTTR) being constructed. For the 9th assembly loaded with the first mass-product fuel, the fission gas release, R/B of ^{88}Kr, was relatively high, 1.5×10^{-5}, and various defects were observed in the ceramography of the irradiated coating layers. Afterwards, a decrease was achieved in the through-coating failure fractions at the fabrication. Correspondingly, the R/B of ^{88}Kr for the 12th assembly was reduced to an excellent value of 2×10^{-6}. Thus, the production technology and the irradiation performance of the HTTR design fuels were successfully demonstrated. (author).

10071 (JAERI-Research–94-038) **Study on through-thickness attenuation of irradiation embrittlement using JPDR pressure vessel.** Suzuki, Masahide (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Idei, Yoshio. Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1994. 28p. (In Japanese). Order Number DE95747904. Source: OSTI; NTIS; INIS.

Some components of Japan Power Demonstration Reactor (JPDR), which has been decommissioned, are utilized for the investigation of aging of a nuclear reactor at Japan Atomic Energy Research Institute (JAERI). The present paper reports the through-thickness attenuation characteristics of irradiation hardening based on the examination of the reactor pressure vessel (RPV). The RPV was exposed to the maximum dose of 2×10^{18} n/cm^2 (E>1MeV) at the inner surface at the corebelt region. At the position of 50 mm inside the pressure vessel steel from the inner surface, dose is decreased roughly to 50%. The attenuation was evaluated either by detailed calculation or JEAC 4206 attenuation equation. Through-thickness attenuation of irradiation hardening was predicted using these dose attenuation curves, and compared with the results of hardness measurements. As a result, actual attenuation was larger than predicted values. (author).

10072 (JAERI-Tech–94-025) **Development of calibration method for differential pressure transmitter in D_2O cooling system of JRR-3M.** Takeuchi, Mitsuo (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Ohwada, Minoru. Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1994. 26p. (In Japanese). Order Number DE95747889. Source: OSTI; NTIS; INIS.

Differential pressure transmitters of process instrumentation installed in the D_2O cooling system are inspected during the periodic inspection of JRR-3M. Differential pressure transmitter was calibrated by the air regulator until last inspection, but it was difficult to work with D_2O vapor including tritium. A new calibration method using fluid regulator was developed. The fluid regulator permits continuous fluid pressure change by manual operation from 0 to 6kg/cm^2. There was no atmospheric D_2O vapor when the new method was adopted and the calibration work was carried out quite smoothly. The new calibration method has been successfully applied to the periodic inspection of the differential pressure transmitter of process instrumentation in the D_2O cooling system of JRR-3M. (author).

10073 (JINR-E–3-93-65, pp. 13-19) **Effective reactor pulse compression based on continuously swept frequency modulation.** Hiismaeki, P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 341p. (CONF-9209225–: International seminar on structural investigation at pulsed neutron sources, Dubna (Russian Federation), 1-4 Sep 1992). In *International seminar on structural investigations on pulsed neutron sources. Proceedings.* Order Number DE95618907. Source: OSTI; NTIS (US Sales Only); INIS.

The design of a moderator for pulsed neutron source developed at the IBR-2 reactor is described. The method based on the reverse time-of-flight principle and the mechanical Fourier chopper positioned outside of the biological shield are applied. The results obtained so far clearly indicate that the main design objective of

achieving high resolution over a large spectrum of wavelengths without too heavy losses in the intensity can be met. 4 refs., 4 figs.

10074 (Juel–2961) **Modelling of subcooled boiling in ATHLET and application in water cooled research reactors.** Hainoun, A. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Sicherheitsforschung und Reaktortechnik; Bochum Univ. (Germany). Fakultaet fuer Maschinenbau. Sep 1994. 152p. (In German). Order Number DE95745792. Source: OSTI; NTIS (US Sales Only); INIS.

A model is implemented to describe the thermodynamic nonequilibrium effects in subcooled boiling regime. The aim is to simulate void distribution and thermodynamic instability, which is practicularly pronounced in research reactors due to high power densities and low system pressures, and to include the influence of the steam formed in this boiling regime on the neutron balance. The model developed considers the competing effects of vaporization and condensation during subcooled boiling. It describes the rate of bubble generation on superheated surfaces and the subsequent condensation of steam in the subcooled liquid. The installed model is validated by postcalculations of two extensive series of experiments. The extended and verified program is used to simulate the Juelich research reactor FRJ-2. For this purpose, a full-scale simulation model of the entire plant is developed ensuring, in particular, a precise reproduction of the geometry and the arrangement of the annular fuel element cooling channels. The modelled reactor plant is first used to simulate normal reactor operation. The resulting steady-state temperature and pressure distributions assuming a thermal power of 23 MW show good agreement with real operating data. Safety investigations are conducted to examine plant behaviour under design-basis accident conditions. This includes failure of all three main coolent pumps with proper and delayed reactor scram. In both cases, the simulation shows that the fuel elements are not endangered in any phase of the transient, although in the event of a delayed scram initial signs of parallel channel instability due to steam formation in the central fuel element are to be observed which, however, only prevails for a short period of 30 ms. (orig./HP)

10075 (PNL–4678-Rev.) **N Reactor thermal plume characterization study during dual-purpose mode of operation. Part I: Field investigation, Part II: Computer simulation.** Ecker, R.M.; Walters, W.H.; Thompson, F.L. Pacific Northwest Lab., Richland, WA (United States). Sep 1983. 227p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95006507. Source: OSTI; NTIS; GPO Dep.

The U.S. Department of Energy was issued a National Pollutant Discharge Elimination System (NPDES) permit for operation of the N Reactor discharge from December 7, 1981, through December 31, 1985. Part 1.A.9 (Effluent Limitations, Monitoring Requirements, and Schedule of Compliance) states in part that a detailed low-flow receiving-water study be conducted to document the extent and nature of the existing outfall discharge plume. Pacific Northwest Laboratory conducted a two-phase program to characterize the N Reactor thermal plume. The work was performed for UNC Nuclear Industries, Inc., the operator of N Reactor for the U.S. Department of Energy (DOE). Part I of this report deals with the field studies to characterize the N Reactor thermal plume, performed September 15 through 20, 1982. It includes a description of the study area, a description of field tasks and procedures, and data collection results and discussion. The field studies consisted of a bathymetric survey, underway thermal surveys, dye dispersion surveys, and vertical velocity measurements. Part II is the computer simulation of the thermal plume under different flow conditions and the calibration of the model used. It includes a description of the computer model and the assumptions on which it is based, a presentation of the input data used in this application, and a discussion of modeling results. The model is used to predict the effects of the discharged heated water on downstream river temperatures for flow conditions from 36,000 cubic feet per second (cfs) to 300,000 cfs. Figures called out in the text of this report are found at the end of each section.

10076 (WHC-SA–2621) **The Fast Flux Test Facility shutdown program plan.** Guttenberg, S.; Jones, D.H.; Midgett, J.C.; Nielsen, D.L. Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950216–37: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95006799. Source: OSTI; NTIS; INIS; GPO Dep.

The Fast Flux Test Facility (FFTF) is a 400 MWt sodium-cooled research reactor owned by the US Department of Energy (DOE) and operated by the Westinghouse Hanford Company (WHC) on the Hanford Site in southeastern Washington State. The decision was made by the DOE in December, 1993, to initiate shutdown of the FFTF. This paper describes the FFTF Transition Project Plan (1) (formerly the FFTF Shutdown Program Plan) which provides the strategy, major elements, and project baseline for transitioning the FFTF to an industrially and radiologically safe shutdown condition. The Plan, and its resource loaded schedule, indicate this transition can be achieved in a period of six to seven years at a cost of approximately $359 million. The transition activities include reactor defueling, fuel offload to dry cask storage, sodium drain and reaction, management of sodium residuals, shutdown of auxiliary systems, and preparation of appropriate environmental and regulatory documentation. Completion of these activities will involve resolution of many challenging and unique issues associated with shutdown of a large sodium reactor facility. At the conclusion of these activities, the FFTF will be in a safe condition for turnover to the Hanford Site Environmental Restoration Contractor for a long term surveillance and maintenance phase and decommissioning.

10077 (ANL/RE/CP–83488) **Natural convection mass transfer on a vertical steel structure submerged in a molten aluminum pool.** Cheung, F.B. (Pennsylvania State Univ., University Park, PA (United States)); Yang, B.C.; Shiah, S.W.; Cho, D.H.; Tan, M.J. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941142–30: American Society of Mechanical Engineers' winter annual meeting, Chicago, IL (United States), 9-11 Nov 1994). Order Number DE95005878. Source: OSTI; NTIS; INIS; GPO Dep.

The process of dissolution mass transport along a vertical steel structure submerged in a large molten aluminum pool is studied theoretically. A mathematical model is developed from the conservation laws and thermodynamic principles, taking full account of the density variation in the dissolution boundary layer due to concentration differences. Also accounted for are the influence of the solubility of the wall material on species transfer and the motion of the solid/liquid interface at the dissolution front. The governing equations are solved by a combined analytical-numerical technique to determine the characteristics of the dissolution boundary layer and the rate of natural convection mass transfer. Based upon the numerical results, a correlation for the average Sherwood number is obtained. It is found that the Sherwood number depends strongly on the saturated concentration of the substrate at the moving dissolution front but is almost independent of the freestream velocity.

10078 (BNL–52445) **Aircraft impact analysis for the HFBR.** Stock, D.; Biele, F. Brookhaven National Lab., Upton, NY (United States). Feb 1993. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95004895. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents an analysis performed to determine the annual frequency at which aircraft are expected to strike the High Flux Beam Reactor (HFBR) complex, located at Brookhaven National Laboratory. Since the HFBR is not hardened against light aircraft, this report considers the impact of military, commercial, twin engine and single engine aircraft operating in the vicinity of the HFBR. The large volume of light aircraft operating in this area contributes heavily to the estimated annual impact frequency of 3.54E-05 impacts per year. There are two chapters and seven appendices in this report. The first chapter describes the airspace in the vicinity of the HFBR. This includes five airports, two major airways, one standard arrival route, as well as a significant volume of

radar vectored and air-taxi traffic. The second chapter of this report presents the calculations by which the expected impact frequency was derived, and an assessment of the uncertainty in those calculations. The calculations were performed using the method outlined in the NRC Standard Review Plan. A separate set of calculations is presented for each of three sources of aircraft: airway traffic, Brookhaven Airport, and Calverton Airport. The appendices contain discussions and side calculations ancillary to the presentation in the second section. This includes a discussion of the data used to estimate traffic counts, information on accident rates, and several other points which would have only been distracting if included in the main discussion.

10079 (BNL-NUREG–60844) **Analysis of failure dependent test, repair and shutdown strategies for redundant trains.** Uryasev, S.; Samanta, P. Brookhaven National Lab., Upton, NY (United States). Sep 1994. 10p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950420–9: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 may 1995). Order Number DE95002178. Source: OSTI; NTIS; INIS; GPO Dep.

Failure-dependent testing implies a test of a redundant components (or trains) when failure of one component has been detected. The purpose of such testing is to detect any common cause failures (CCFs) of multiple components so that a corrective action such as repair or plant shutdown can be taken to reduce the residence time of multiple failures, given a failure has been detected. This type of testing focuses on reducing the conditional risk of CCFs. Formulas for calculating the conditional failure probability of a two train system with different test, repair and shutdown strategies are developed. A methodology is presented with an example calculation showing the risk-effectiveness of failure-dependent strategies for emergency diesel generators (EDGs) in nuclear power plants (NPPs).

10080 (CONF-9410216–4) **Structural aging program status report.** Naus, D.J. (Oak Ridge National Lab., TN (United States)); Oland, C.B.; Ellingwood, B.; Graves, H.L. III. Oak Ridge National Lab., TN (United States). [1994]. 24p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From 22. transactions of the water reactor safety information meeting; Bethesda, MD (United States); 24-26 Oct 1994. Order Number DE95006387. Source: OSTI; NTIS; INIS; GPO Dep.

Research is being conducted at the Oak Ridge National Laboratory under Nuclear Regulatory Commission (USNRC) sponsorship to address aging management of safety-related concrete structures. Documentation is being prepared to provide the USNRC with potential structural safety issues and acceptance criteria for use in continued service evaluations of nuclear power plants. Program accomplishments have included development of the Structural Materials Information Center containing data and information on the time variation of 144 material properties under the influence of pertinent environmental stressors or aging factors, performance assessments of reinforced concrete structures in several United Kingdom nuclear power facilities, evaluation of European and North American repair practices for concrete, an evaluation of factors affecting the corrosion of metals embedded in concrete, and application of the time-dependent reliability methodology to reinforced concrete flexure and shear structural elements to investigate the role of in-service inspection and repair on their probability of failure.

10081 (CONF-9410216–5) **Detection of pump degradation.** Casada, D. Oak Ridge National Lab., TN (United States). [1994]. 26p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From 22. transactions of the water reactor safety information meeting; Bethesda, MD (United States); 24-26 Oct 1994. Order Number DE95006734. Source: OSTI; NTIS; INIS; GPO Dep.

There are a variety of stressors that can affect the operation of centrifugal pumps. Although these general stressors are active in essentially all centrifugal pumps, the stressor level and the extent of wear and degradation can vary greatly. Parameters that affect the extent of stressor activity are manifold. In order to assure the long-term operational readiness of a pump, it is important to both understand the nature and magnitude of the specific degradation mechanisms and to monitor the performance of the pump. The most commonly applied method of monitoring the condition of not only pumps, but rotating machinery in general, is vibration analysis. Periodic or continuous spectral vibration analysis is a cornerstone of most pump monitoring programs. In the nuclear industry, non-spectral vibration monitoring of safety-related pumps is performed in accordance with the ASME code. Although vibration analysis has dominated the condition monitoring field for many years, there are other measures that have been historically used to help understand pump condition: advances in historically applied technologies and developing technologies offer improved monitoring capabilities. The capabilities of several technologies (including vibration analysis, dynamic pressure analysis, and motor power analysis) to detect the presence and magnitude of both stressors and resultant degradation are discussed.

10082 (DOE/ER/75787–2) **Improving human reliability through better nuclear power plant system design. Progress report.** Golay, M.W. Massachusetts Inst. of Tech., Cambridge, MA (United States). Program for Advanced Nuclear Power Studies. 10 Jan 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER75787. Order Number DE95006644. Source: OSTI; NTIS; INIS; GPO Dep.

The project on "Development of a Theory of the Dependence of Human Reliability upon System Designs as a Means of Improving Nuclear Power Plant Performance" has been undertaken in order to address the important problem of human error in advanced nuclear power plant designs. Most of the creativity in formulating such concepts has focused upon improving the mechanical reliability of safety related plant systems. However, the lack of a mature theory has retarded similar progress in reducing the likely frequencies of human errors. The main design mechanism used to address this class of concerns has been to reduce or eliminate the human role in plant operations and accident response. The plan of work being pursued in this project is to perform a set of experiments involving human subject who are required to operate, diagnose and respond to changes in computer-simulated systems, relevant to those encountered in nuclear power plants. In the tests the systems are made to differ in complexity in a systematic manner. The computer program used to present the problems to be solved also records the response of the operator as it unfolds. Ultimately this computer is also to be used in compiling the results of the project. The work of this project is focused upon nuclear power plant applications. However, the persuasiveness of human errors in using all sorts of electromechanical machines gives it a much greater potential importance. Because of this we are attempting to pursue our work in a fashion permitting broad generalizations.

10083 (DOE/ER/75787–3) **The dependence of human reliability upon task information content.** Hermanson, E.M.; Golay, M.W. Massachusetts Inst. of Tech., Cambridge, MA (United States). Program for Advanced Nuclear Power Studies. Sep 1994. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER75787. Order Number DE95006645. Source: OSTI; INIS; NTIS; GPO Dep.

The role of human error in safety mishaps is an important factor in system design. As systems become increasingly complex the capacity of the human to deal with the added complexity is diminished. It is therefore crucial to understand the relationship between system complexity and human reliability so that systems may be built in such a way as to minimize human error. One way of understanding this relationship is to quantify system complexity and then measure the human reaction in response to situations of varying complexity. The quantification of system complexity may be performed by determining the information content present in the tasks that the human must execute. The purpose of this work is therefore to build and perform a consistent experiment which will determine the extent to which human reliability depends upon task information content. Two main conclusions may be drawn from this work. The first is that human reliability depends upon task information content. Specifically, as the information content contained in a task increases, the capacity of a human to deal successfully with the task decreases monotonically. Here the definition of total success

is the ability to complete the task at hand fully and correctly. Furthermore, there exists a value of information content below which a human can deal with the task successfully, but above which the success of an individual decreases monotonically with increasing information. These ideas should be generalizable to any model where system complexity can be clearly and consistently defined.

10084 (FZR–54) **Analysis of transients for NPP with VVER-440 using the code SiTAP.** Kalinenko, V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Inst. Atomnoj Ehnergii). Forschungszentrum Rossendorf e.V. (FZR), Dresden (Germany). Inst. fuer Nukleare Sicherheit. Jun 1994. 72p. Order Number DE95752196. Source: OSTI; NTIS (US Sales Only); INIS.

The report contains analysis of transients "Loop connection" and "Steam generator tube rupture" for nuclear power plants (NPP) with VVER-440. To obtain more detailed information about NPP's dynamic characteristics, various variants of initial and boundary conditions are considerd. Calculation of these transients was performed using the SiTAP code developed at the Nuclear Safety Institute of the Russian Research Centre "Kurchatov Institute". SiTAP code is a multifunctional computer tool for fast analysis of transient and accidental processes of VVER type reactors for engineers working in the field of NPP dynamics. SiTAP can be used form comparative analysis of several variants of accident scenarios to find out the conditions leading to most serious consequences from a safety point of view. In such cases, additional analyses using best-estimate codes should be carried out. The results of SiTAP for a faulty loop connection leading to a boron dilution accident are intended to be used as boundary conditions for a more detailed anlaysis with the aid of the three-dimensional reactor core model DYN3D, developed in the Research Centre Rossendorf for the simulation of reactivity initiated accidents. (orig.)

10085 (GRS-F–1993-EN) **Annual report on reactor safety research projects sponsored by the Ministry for Research and Technology of the Federal Republic of Germany. Reporting period 1993. Progress report.** Gesellschaft fuer Reaktorsicherheit mbH (GRS), Koeln (Germany). Oct 1994. [360p.] Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Order Number DE95755616. Source: OSTI; NTIS (US Sales Only); INIS.

The Gesellschaft fuer Anlagen- und Reaktorsicherheit (GRS) mbH, by order of the BMFT, informs continuously of the status of such investigations by means of semi-annual and annual publication of progress reports within the series GRS-F-Fortschrittsberichte (GRS-F-Progress Reports). Each progress report represents a compilation of individual reports about objectives, the work performed, the results, the next steps of the work etc. The individual reports are prepared in a standard form by the contractors themselves as a documentation of their progress in work and published by the Forschungsbetreuung at the GRS, (FB) (Research Coordination Department), within the framework of general information of progress in reactor safety research. The individual reports are classified according to the same classification system as applied in the nuclear index of the CEC (Commission of the European Communities) and the OECD (Organization for Economic Cooperation and Development). The reports are arranged in sequence of their project numbers. (orig./HP)

10086 (IKPH–183/92) **Underwater-manipulation system for measuring- and cutting tasks in dismantling decommissioned nuclear facilities. Final report.** Stegemann, D.; Reimche, W.; Hansch, M.; Spitzer, M. Hannover Univ. (Germany). Inst. fuer Kerntechnik und Zerstoerungsfreie Pruefverfahren. [1995]. 46p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 02S7329. Order Number DE95753436. Source: OSTI; NTIS (US Sales Only); INIS.

Not only manipulators are necessary for dismantling and inspection of structure parts in decomissioned nuclear facilities, but flexible underwater-vehicles. Free-diving underwater-vehicles for inspection and dismantling tasks are still not developed and tested. Aim of the project is the development of sensors and devices for the position determination and the depth regulation. For inspection tasks an ultrasonic measurement and dosimeter device shall be built up. A measurement device has been developed which evaluates the ultrasonic time of flight from a transmitter at the vehicle to several receivers, installed in the reactor pressure vessel. The depth regulation is based on a pressure sensor and the direct control of the thrusters. The ultrasonic measurements are realized by an adapted ultrasonic card, the γ-dosimetry with an ionization chamber and a pA-amplifier. An acoustic orientation system was built up, which measures very accurately with one transmitter mounted on the vehicle and four receivers. Problem occur by reflection from the walls of the basin. The depth regulation is working faultless. The ultrasonic device is preferably used for distance measurement. The radiation measurement device was tested and mounted in the vehicle. (orig./HP)

10087 (INIS-mf–15082) **Survey of reportable events in nuclear power plant in the Federal Republic of Germany. Period covered: 3rd quarter 1993.** Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany). [1994]. 11p. (In German). Order Number DE95745764. Source: OSTI; NTIS (US Sales Only); INIS.

There were 57 reportable events in the period covered. 56 events belonged to the lowest reporting category N (normal notification), one event falled in the reporting category S (emergency notification). According to the INES evaluation scale 54 events belonged to the category O (lowest scale) and 3 to the INES scale 1 (malfunction). There was no release above limit of radioactivity involved in these incidents nor were there any effects on man or the environment reported. (orig.)

10088 (INIS-mf–15092) **Safety and reliability analysis of a technical system applying the multistate coherent system analysis for evaluating a finite number of normal operating modes and failure modes. Final report.** Rakowsky, U.; Meyna, A.; Peters, O.H. Wuppertal Univ. (Gesamthochschule) (Germany). Fachbereich 14 - Sicherheitstechnik. 1992. 387p. (In German). DFG Pe 179/7-1/2. Order Number DE95746721. Source: OSTI; NTIS (US Sales Only); INIS.

Report and separate annex.

The further development of multistate coherent systems analysis is explained which is based on monotone multistate component analysis in contrast to the discrete state component analysis. The method applied allows to derive from the data giving the failure and the lifetime probabilities of a component, the multi-valued probabilities as a function of time. The method is particularly suitable for evaluating the reliability of components subject to aging processes which are not quantitatively measurable. Main applications are in nuclear engineering and in aircraft and spacecraft engineering. (DG)

10089 (INIS-mf–15100) **Survey of reportable events in nuclear power plants in the Federal Republic of Germany. Period covered: 3rd quarter 1994.** Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany). [1995]. 9p. (In German). Order Number DE95753445. Source: OSTI; NTIS (US Sales Only); INIS.

There were 45 reportable events in the period covered. All 45 events belonged to the lowest reporting category N (normal notification, INES scale 0). There was no release above limit of radioactivity nor were there any effects on man or environment. (HP)

10090 (Juel–2956) **Experimental investigations of graphite corrosion and aerosol formation during air ingress into the core of a high temperature pebble bed reactor.** Roes, J. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Sicherheitsforschung und Reaktortechnik; Technische Hochschule Aachen (Germany). Aug 1994. 179p. (In German). Order Number DE95745906. Source: OSTI; NTIS (US Sales Only); INIS.

A High Temperature Reactor can be designed to remove the decay heat without using any active systems. For most accident scenarios a release of radioactive fission products can be excluded by design. However, during operation of a HTR some accidents are principally possible, which can result in a release of fission products out of the fuel elements and of the reactor system. One of these accidents is a hypothetical massive air ingress into the hot graphite reactor core. After a pressure drop caused by leakages in the primary circuit a gas mass flow may be able to stream through

the core according to free natural convection leading to a corrosion of the graphite fuel elements and reflector structures. With the VELUNA-experiment a testing device was installed, which allows to investigate the corrosion process on parts of a reactor core under real accident conditions. With regard to the experimental results already existing equations to calculate the chemical reaction rate in a pebble bed were modified and the applicability was demonstrated. These equations consider the chemical reaction in the porous graphite as well as diffusion processes to the graphite surface. Equivalent correlations were developed for different flow geometries and for the graphite material of the bottom reflector. The corrosion process forms an aerosol, which consists of graphite particles and a reaction gas phase. The formatted aerosol was characterized concerning its chemical and physical properties. Because the aerosol particles can support the release of fission products, measurements of aerosol parameters like particle mass concentration and particle size distribution provide important information to estimate the radiologic consequences of such an hypothetical air ingress accident. (orig.)

10091 (Juel–2960) **On the selfacting safe limitation of fission power and fuel temperature in innovative nuclear reactors.** Scherer, W.; Brockmann, H.; Drecker, S.; Gerwin, H.; Haas, K.A.; Kugeler, K.; Ohlig, U.; Ruetten, H.J.; Teuchert, E.; Werner, H.; Wolf, L. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Sicherheitsforschung und Reaktortechnik. Aug 1994. 178p. (In German). Order Number DE95745809. Source: OSTI; NTIS (US Sales Only); INIS.

Nuclear energy probably will not contribute significantly to the future worldwide energy supply until it can be made catastrophe-free. Therefore it has to be shown, that the consequences of even largest accidents will have no major impact to the environment of a power plant. In this paper one of the basic conditions for such a nuclear technology is discussed. Using mainly the modular pebble-bed high-temperature reactor as an example, the design principles, analytical methods and the level of knowledge as given today in controlling reactivity accidents by inherent safety features of innovative nuclear reactors are described. Complementary possibilities are shown to reach this goal with systems of different types of construction. Questions open today and resulting requirements for future activities are discussed. Today's knowledge credibly supports the possibility of a catastrophe-free nuclear technology with respect to reactivity events. (orig.)

10092 (KFK–5370) **Influence of control rod enhanced expansion devices on the course of unprotected transients in the EFR.** Kussmaul, G. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Oct 1994. 40p. Order Number DE95752106. Source: OSTI; NTIS (US Sales Only); INIS.

In the safety analysis of fast reactors, unprotected accidents, such as ULOF and UTOP have to be considered, even when their frequency of occurrence lies far beyond the design basis accident. In the European Fast Reactor (EFR), the safety approach foresees further measures of risk minimization in the frame of the so-called Third Shutdown Level. One of the measures is a control rod enhanced expansion device, called ATHENa, which has been developed by KfK in collaboration with SIEMENS as a passive device to separate the absorbers from the drive lines in cases of accidental coolant temperature rises and to force the absorbers further into the core in case of failure to drop. The efficiency of the ATHENa devices to prevent soduim boiling and fuel melting in unprotected accidents in EFR has been investigated by calculations with the dynamics code DYANA2. In the case of ULOF accidents, sodium boiling can be prevented, if at least one out of 24 absorber rods equipped with ATHENa devices drops into the core after delatching from the drive lines. In the extremely remote case that all rods remain jammed after delatching, they are pushed by the ATHENa decices into the core with an enhanced expansion coefficient (≈ 10 times). Even then, sodium boiling could be prevented by extending of the pump coast down halving time from 10 to 12 s or by adjusting the delatching temperature to a value not higher than about 40 C above nominal coolant outlet. In UTOP accidents caused by the uncontrolled withdrawal of a control rod, the main concern is incipient fuel melting. The results of the calculations have shown that the power rise can be terminated by delatching the absorbers, before fuel melting occurs, if the ramp rate is mechanically limited to values of 1 /s or less. Again, even in the worst case that all rods remain jammed, fuel melting could be prevented by adjusting the delatching temperature to a similar value as in the ULOF case. (orig.)

10093 (NUREG–0847-Suppl.14) **Safety evaluation report related to the operation of Watts Bar Nuclear Plant, Units 1 and 2 (Docket Nos. 50-390 and 50-391). Supplement No. 14.** Tam, P.S. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Reactor Projects I/II. Dec 1994. 117p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

Supplement No. 14 to the Safety Evaluation Report for the application filed by the Tennessee Valley Authority for license to operate Watts Bar Nuclear Plant, Units 1 and 2, Docket Nos. 50-390 and 50-391, located in Rhea County, Tennessee, has been prepared by the Office of Nuclear Reactor Regulation of the Nuclear Regulatory Commission. The purpose of this supplement is to update the Safety Evaluation with additional information submitted by the applicant since Supplement No. 13 was issued, and matters that the staff had under review when Supplement No. 13 was issued.

10094 (NUREG/CP–0145) **Workshop on Developing Safe Software.** Lawrence, J.D. (Lawrence Livermore National Lab., CA (United States)). Nuclear Regulatory Commission, Washington, DC (United States). Div. of Reactor Controls and Human Factors; Lawrence Livermore National Lab., CA (United States). Nov 1994. 20p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (CONF-9207249–: Workshop on developing safe software, San Diego, CA (United States), 22-23 Jul 1992). Source: OSTI; NTIS; GPO; INIS.

The Workshop on Developing Safe Software was held July 22–23, 1992, at the Hotel del Coronado, San Diego, California. The purpose of the workshop was to have four world experts discuss among themselves software safety issues which are of interest to the US Nuclear Regulatory Commission. These issues concern the development of software systems for use in nuclear power plant protection systems. The workshop comprised four sessions. Wednesday morning, July 22, consisted of presentations from each of the four panel members. On Wednesday afternoon, the panel members went through a list of possible software development techniques and commented on them. The Thursday morning, July 23, session consisted of an extended discussion among the panel members and the observers from the NRC. A final session on Thursday afternoon consisted of a discussion among the NRC observers as to what was learned from the workshop.

10095 (NUREG/CR–4838) **Microcomputer applications of, and modifications to, the modular fault trees.** Zimmerman, T.L. (Sandia National Labs., Albuquerque, NM (United States)); Graves, N.L.; Payne, A.C. Jr.; Whitehead, D.W. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Issue Resolution; Sandia National Labs., Albuquerque, NM (United States). Oct 1994. 375p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-94AL85000. (SAND–88-1887). Source: OSTI; NTIS; GPO; INIS.

The LaSalle Probabilistic Risk Assessment was the first major application of the modular logic fault trees after the IREP program. In the process of performing the analysis, many errors were discovered in the fault tree modules that led to difficulties in combining the modules to form the final system fault trees. These errors are corrected in the revised modules listed in this report. In addition, the application of the modules in terms of editing them and forming them into the system fault trees was inefficient. Originally, the editing had to be done line by line and no error checking was performed by the computer. This led to many typos and other logic errors in the construction of the modular fault tree files. Two programs were written to help alleviate this problem: (1) MODEDIT - This program allows an operator to retrieve a file for editing, edit the file for the plant specific application, perform some general error checking while the file is being modified, and store the file for later use, and (2) INDEX - This program checks that the modules

that are supposed to form one fault tree all link up appropriately before the files are,loaded onto the mainframe computer. Lastly, the modules were not designed for relay type logic common in BWR designs but for solid state type logic. Some additional modules were defined for modeling relay logic, and an explanation and example of their use are included in this report.

10096 (NUREG/CR–5994) **Emergency diesel generator: Maintenance and failure unavailability, and their risk impacts.** Samanta, P. (Brookhaven National Lab., Upton, NY (United States)); Kim, I.; Uryasev, S.; Penoyar, J.; Vesely, W. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research; Brookhaven National Lab., Upton, NY (United States). Nov 1994. 215p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (BNL-NUREG–52363). Source: OSTI; NTIS; GPO; INIS.

Emergency Diesel Generators (EDGs) provide on-site emergency alternating current (ac) electric power for a nuclear plant in the event that all off-site power sources are lost. Existing regulations establish requirements for designing and testing of these on-site power sources to reduce to an acceptable level the probability of losing all ac power sources. Operating experience with EDGs has raised questions about their testing and maintenance to achieve the EDG reliability levels and the total EDG unavailability experienced (fraction of time EDG is out-of-service due to testing, maintenance, and failures). In this report, recent operating experience is used to assess EDG unavailability due to testing, maintenance, and failures during reactor power operation and during plant shutdown. Recent data show an improvement in EDG reliability, but an increase in EDG unavailability due to maintenance, a significant portion of which is due to routinely scheduled maintenances. Probabilistic safety assessments (PSAs) of selected nuclear power plants are used to assess the risk impact of EDG unavailability due to maintenance and failure during power operation, and during different stages of plant shutdown. The results of these risk analyses suggest qualitative insights for scheduling EDG maintenance that will have minimal impact on risk of operating nuclear power plants.

10097 (NUREG/CR–6075) **The probability of containment failure by direct containment heating in Zion.** Pilch, M.M. (Sandia National Labs., Albuquerque, NM (United States)); Yan, H.; Theofanous, T.G. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research; Sandia National Labs., Albuquerque, NM (United States). Dec 1994. 385p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-94AL85000. (SAND–93-1535). Source: OSTI; NTIS; GPO; INIS.

This report is the first step in the resolution of the Direct Containment Heating (DCH) issue for the Zion Nuclear Power Plant using the Risk Oriented Accident Analysis Methodology (ROAAM). This report includes the definition of a probabilistic framework that decomposes the DCH problem into three probability density functions that reflect the most uncertain initial conditions (UO_2 mass, zirconium oxidation fraction, and steel mass). Uncertainties in the initial conditions are significant, but our quantification approach is based on establishing reasonable bounds that are not unnecessarily conservative. To this end, we also make use of the ROAAM ideas of enveloping scenarios and "splintering." Two causal relations (CRs) are used in this framework: CR1 is a model that calculates the peak pressure in the containment as a function of the initial conditions, and CR2 is a model that returns the frequency of containment failure as a function of pressure within the containment. Uncertainty in CR1 is accounted for by the use of two independently developed phenomenological models, the Convection Limited Containment Heating (CLCH) model and the Two-Cell Equilibrium (TCE) model, and by probabilistically distributing the key parameter in both, which is the ratio of the melt entrainment time to the system blowdown time constant. The two phenomenological models have been compared with an extensive database including recent integral simulations at two different physical scales. The containment load distributions do not intersect the containment strength (fragility) curve in any significant way, resulting in containment failure probabilities less than 10^{-3} for all scenarios considered. Sensitivity analyses did not show any areas of large sensitivity.

10098 (NUREG/CR–6075-Suppl.1) **The probability of containment failure by direct containment heating in Zion. Supplement 1.** Pilch, M.M. (Sandia National Labs., Albuquerque, NM (United States)); Allen, M.D.; Stamps, D.W.; Tadios, E.L.; Knudson, D.L. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research; Sandia National Labs., Albuquerque, NM (United States). Dec 1994. 536p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-94AL85000. (SAND–93-1535-Suppl.1). Source: OSTI; NTIS; GPO; INIS.

Supplement 1 of NUREG/CR-6075 brings to closure the DCH issue for the Zion plant. It includes the documentation of the peer review process for NUREG/CR-6075, the assessments of four new splinter scenarios defined in working group meetings, and modeling enhancements recommended by the working groups. In the four new scenarios, consistency of the initial conditions has been implemented by using insights from systems-level codes. SCDAP/RELAP5 was used to analyze three short-term station blackout cases with Different lead rates. In all three case, the hot leg or surge line failed well before the lower head and thus the primary system depressurized to a point where DCH was no longer considered a threat. However, these calculations were continued to lower head failure in order to gain insights that were useful in establishing the initial and boundary conditions. The most useful insights are that the RCS pressure is-low at vessel breach metallic blockages in the core region do not melt and relocate into the lower plenum, and melting of upper plenum steel is correlated with hot leg failure. THE SCDAP/RELAP output was used as input to CONTAIN to assess the containment conditions at vessel breach. The containment-side conditions predicted by CONTAIN are similar to those originally specified in NUREG/CR-6075.

10099 (NUREG/CR–6141) **Handbook of methods for risk-based analyses of technical specifications.** Samanta, P.K. (Brookhaven National Lab., Upton, NY (United States)); Kim, I.S.; Mankamo, T.; Vesely, W.E. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research; Brookhaven National Lab., Upton, NY (United States); Avaplan Oy, Espoo (Finland); Science Applications International Corp., Dublin, OH (United States). Dec 1994. 178p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (BNL-NUREG–52398). Source: OSTI; NTIS; INIS; GPO.

Technical Specifications (TS) requirements for nuclear power plants define the Limiting Conditions for Operation (LCOs) and Surveillance Requirements (SRs) to assure safety during operation. In general, these requirements are based on deterministic analysis and engineering judgments. Experiences with plant operation indicate that some elements of the requirements are unnecessarily restrictive, while a few may not be conducive to safety. The US Nuclear Regulatory Commission (USNRC) Office of Research has sponsored research to develop systematic risk-based methods to improve various aspects of TS requirements. This handbook summarizes these risk-based methods. The scope of the handbook includes reliability and risk-based methods for evaluating allowed outage times (AOTs), scheduled or preventive maintenance, action statements requiring shutdown where shutdown risk may be substantial, surveillance test intervals (STIs), and management of plant configurations resulting from outages of systems, or components. For each topic, the handbook summarizes analytic methods with data needs, outlines the insights to be gained, lists additional references, and gives examples of evaluations.

10100 (NUREG/CR–6285) **Severe accident natural circulation studies at the INEL.** Bayless, P.D.; Brownson, D.A.; Dobbe, C.A.; Jones, K.R.; O'Brien, J.E.; Pafford, D.J.; Schlenker, L.D.; Tung, V.X. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research; Idaho National Engineering Lab., Idaho Falls, ID (United States). Feb 1995. 213p. Sponsored by USDOE, Washington, DC (United States);Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. Source: OSTI; INIS; NTIS (US Sales Only).

Severe accident natural circulation flows have been investigated at the Idaho National Engineering Laboratory to better understand

these flows and their potential impacts on the progression of a pressurized water reactor severe accident. Parameters affecting natural circulation in the reactor vessel and hot legs were identified and ranked based on their perceived importance. Reviews of the scaling of the 1/7-scale experiments performed by Westinghouse were undertaken. RELAP5/MOD3 calculations of two of the experiments showed generally good agreement between the calculated and observed behavior. Analyses of hydrogen behavior in the reactor vessel showed that hydrogen stratification is not likely to occur, and that an initially stratified layer of hydrogen would quickly mix with a recirculating steam flow. An analysis of the upper plenum behavior in the Three Mile Island, Unit 2 reactor concluded that vapor temperatures could have been significantly higher than the temperatures seen by the control rod drive lead screws, supporting the premise that a strong natural circulation flow was likely present during the accident. SCDAP/RELAP5 calculations of a commercial pressurized water reactor severe accident without operator actions showed that the natural circulation flows enhance the likelihood of ex-vessel piping failures long before failure of the reactor vessel lower head.

10101 (NUREG/CR–6294) **Design factors for safety-critical software.** Lawrence, J.D. (Lawrence Livermore National Lab., CA (United States)); Preckshot, G.G. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Reactor Controls and Human Factors; Lawrence Livermore National Lab., CA (United States). Dec 1994. 14p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

This report is the fourth of a series of reports prepared for the Nuclear Regulatory Commission Office Reactor Regulation, and provides the summary and conclusion for this task. It is widely believed in the software engineering community that almost anything can affect the ability of software to reliably its tasks, particularly when safety is at issue. While this statement is true, both in the abstract and in specific instances, it is not particularly helpful. It remains necessary for auditors and other reviewers to assure themselves and the public that safety-critical software has sufficiently low probability of failing in such a way as to cause death or injury to permit it to be used in safety-critical applications. Achieving this assurance is best done by using a well-planned, methodical approach. A possible approach is to concentrate on those attributes of the software and the development process (design factors) that are most influential in achieving dependable software. Seventy-four design factors are identified in this report, divided into nine categories. Seven categories relate to the development process, and one category relates to the products of that process. The remaining category contains negative factors whose presence should be regarded as cause for intense scrutiny of the development process. Seven of the design factors should be considered mandatory for any organization responsible for developing safety-critical software. An additional nine factors are considered essential to safety, but not as important as the first seven. The remaining design factors can provide additional important indications of the quality of the development effort and the software resulting from that effort.

10102 (SAND–95-0148C) **A review of the Melcor Accident Consequence Code System (MACCS): Capabilities and applications.** Young, M. Sandia National Labs., Albuquerque, NM (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States);Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9411156–2: International Atomic Energy Agency (IAEA) technical committee meeting, Vienna (Austria), 21-25 Nov 1994). Order Number DE95006808. Source: OSTI; NTIS; INIS; GPO Dep.

MACCS was developed at Sandia National Laboratories (SNL) under U.S. Nuclear Regulatory Commission (NRC) sponsorship to estimate the offsite consequences of potential severe accidents at nuclear power plants (NPPs). MACCS was publicly released in 1990. MACCS was developed to support the NRC's probabilistic safety assessment (PSA) efforts. PSA techniques can provide a measure of the risk of reactor operation. PSAs are generally divided into three levels. Level one efforts identify potential plant damage states that lead to core damage and the associated probabilities, level two models damage progression and containment strength for establishing fission-product release categories, and level three efforts evaluate potential off-site consequences of radiological releases and the probabilities associated with the consequences. MACCS was designed as a tool for level three PSA analysis. MACCS performs probabilistic health and economic consequence assessments of hypothetical accidental releases of radioactive material from NPPs. MACCS includes models for atmospheric dispersion and transport, wet and dry deposition, the probabilistic treatment of meteorology, environmental transfer, countermeasure strategies, dosimetry, health effects, and economic impacts. The computer systems MACCS is designed to run on are the 386/486 PC, VAX/VMS, E3M RISC S/6000, Sun SPARC, and Cray UNICOS. This paper provides an overview of MACCS, reviews some of the applications of MACCS, international collaborations which have involved MACCS, current developmental efforts, and future directions.

10103 (WHC-SD-SP-PHA–001) **PRTR/309 building nuclear facility preliminary.** Cornwell, B.C. Westinghouse Hanford Co., Richland, WA (United States). 8 Dec 1994. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005164. Source: OSTI; NTIS; INIS; GPO Dep.

The hazard classification of the Plutonium Recycle Test Reactor (PRTR)/309 building as a "Radiological Facility" and the office portions as "Other Industrial Facility" are documented by this report. This report provides: a synopsis of the history and facility it's uses; describes major area of the facility; and assesses the radiological conditions for the facility segments. The assessment is conducted using the hazard category threshold values, segmentation methodology, and graded approach guidance of DOE-STD-1027-92.

24 POWER TRANSMISSION AND DISTRIBUTION

2401 Power Systems

10104 (ORNL/HTSPC–6) **Oak Ridge National Laboratory (ORNL) Superconducting Technology Program for electric power systems. Annual report for FY 1994.** Koncinski, W.S. (ed.); Hawsey, R.A. (comp.). Oak Ridge National Lab., TN (United States). Dec 1994. 85p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95006493. Source: OSTI; NTIS; GPO Dep.

The Oak Ridge National Laboratory (ORNL) Superconducting Technology Program is conducted as part of a national effort by the US Department of Energy's Office of Energy Efficiency and Renewable Energy to develop the technology base needed by US industry for commercial development of electric power applications of high-temperature superconductivity. The three major elements of this program are conductor development, applications development, and the Superconductivity Partnership Initiative. This document describes the major research and development activities for this program together with related accomplishments. The technical progress reported was summarized from information prepared for the FY 1994 Annual Program Review held July 19–20, 2994. This ORNL program is highly leveraged by the staff and other resources of US industry and universities. In fact, nearly three-fourths of the ORNL effort is devoted to industrial competitiveness projects with private companies. Interlaboratory teams are also in place on a number of industry-driven projects. Patent disclosures, working group meetings, staff exchanges, and joint publications and presentations ensure that there is technology transfer with US industry. Working together, the collaborative teams are making rapid progress in solving the scientific and technical issues necessary for the commercialization of long lengths of practical high-temperature superconductor wire and wire products.

10105 (WHC-SD-LL-ATP–021) **CENRTC Project No. 2F3EOA, OCB A-372, acceptance test procedure.** Akerson, A.W. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 59p. Sponsored by USDOE, Washington, DC (United States). DOE

Contract AC06-87RL10930. Order Number DE95005606. Source: OSTI; NTIS; INIS; GPO Dep.

This test procedure provides the steps necessary to verify correct functional operation of controls, annunciators, alarms, protective relays and related systems impacted by CENRTC No. 2F3EOA, Microwave Transfer Trip Project, modification work performed under work package 6B-93-00038/M (CENRTC 2F3EOA MWTT OCB A-372 PACKAGE).

2402 Power System Networks, Transmission and Distribution

10106 (DOE/GO–10095-012) **Superconductivity for electric power systems: Program overview.** National Renewable Energy Lab., Golden, CO (United States). Feb 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95000204. Source: OSTI; NTIS; GPO Dep.

Largely due to government and private industry partnerships, electric power applications based upon high-temperature superconductivity are now being designed and tested only seven years after the discovery of the high-temperature superconductors. These applications offer many benefits to the national electric system including: increased energy efficiency, reduced equipment size, reduced emissions, increased stability/reliability, deferred expansion, and flexible electricity dispatch/load management. All of these benefits have a common outcome: lower electricity costs and improved environmental quality. The U.S. Department of Energy (DOE) sponsors research and development through its Superconductivity Program for Electric Power Systems. This program will help develop the technology needed for U.S. industries to commercialize high-temperature superconductive electric power applications. DOE envisions that by 2010 the U.S. electric power systems equipment industry will regain a major share of the global market by offering superconducting products that outperform the competition.

2406 Legislation and Regulations

10107 (NEI-DK–1867) **Report from the governmental committee on political strategies related to electric power.** Miljoeministeriet, Copenhagen (Denmark); Energiministeriet, Copenhagen (Denmark). Oct 1994. 133p. (In Danish). Order Number DE95755102. Source: OSTI; NTIS.

The Danish government's energy and environmental policy aims at reducing the emission of carbon dioxide by 20% before the year 2005, in relation to CO_2 emission levels in Denmark during 1988. Plans for reducing electricity consumption should thus be incorporated in planning within the electric power industry. The report explains the overall aims of Danish energy and environmental policy and what it means to the electric power sector. Legal aspects of integrated planning regarding resources are discussed and conditions, procedures, guidelines, licensees, and the power distribution companies are dealt with. The growing liberalisation, international competition and cooperation with regard to the European energy market and the European Commission's proposal for a directive on an internal market for electricity are examined in addition to the influence of agreements on import, export and transit on national energy policy. Various forms of environmental frameworks such as emission quotas, negotiable pollution permits and joint implementation are investigated as to whether they would be conducive to the achievement of policy aims. The Danish taxation system related to the production of electric power and cogeneration of power and heating is described and it is investigated to what extent taxation and subsidies in connection with electric power production could support the country's energy/environmental policies. The potentials of using framework planning/control as a method for attaining the goals of air pollution abatement are discussed. (AB)

2407 Economic, Industrial, and Business Aspects

10108 (INIS-BR–3452) **Analysis of tariff levels from electric company in relation to financing request.** Correa, A.L.S. Comissao de Integracao Eletrica Regional (Brazil). Subcomite Economico-Financeiro. Nov 1991. 219p. (In Portuguese). Order Number DE95622085. Source: OSTI; NTIS (US Sales Only); INIS.

The economic-financial model of the Brazilian electric sector is discussed, considering the compatibility of the practiced tariff levels to the demand of consumption market and the production and operation costs. Some institutional actions are identified as solutions for emergency questions and subsides to the big strategies. The economic-finance indicators are also presented, showing the performance of the electrical companies. (C.G.C.).

10109 (INIS-BR–3460) **Improvement of the cogeneration facilities, considering the aspects of financial risks.** Santos, A.H.M. (Escola Federal de Engenharia de Itajuba, MG (Brazil)); Nogueira, L.A.H.; Costa Bortoni, E. da. Associacao Brasileira de Ciencias Mecanicas, Rio de Janeiro, RJ (Brazil). 1992. 5p. (In Portuguese). (CONF-921234–: 4. Brazilian thermal science meeting (ENCIT-92), Rio de Janeiro (Brazil), 1-4 Dec 1992). Order Number DE95622086. Source: OSTI; NTIS (US Sales Only); INIS.

This paper proposes a methodology to include the tools of the Portfolio Theory in the design of the cogeneration facilities. So, the effects of the risk on the return can be take in account. A computer program was developed to simulate the impacts of the thermal and mechanical (or electrical) loads on energy surplus and the potential risk. (C.M.).

10110 (INIS-BR–3461) **Thermal-economic analysis of cogeneration systems.** Walter, A.C.S. (Universidade Estadual de Campinas, SP (Brazil). Faculdade de Engenharia Mecanica); Bajay, S.V.; Nogueira, L.A.O. Associacao Brasileira de Ciencias Mecanicas, Rio de Janeiro, RJ (Brazil). 1992. 4p. (In Portuguese). (CONF-921234–: 4. Brazilian thermal science meeting (ENCIT-92), Rio de Janeiro (Brazil), 1-4 Dec 1992). Order Number DE95622087. Source: OSTI; NTIS (US Sales Only); INIS.

Approximately 80 countries produce sugar, and fortuitously alcohol, from sugar cane. In all these countries the cogeneration technology of steam turbines is utilized, although almost always inefficient. The greater potential of cogeneration in Brazil is in sugar and alcohol sector, because of the use of sugar cane bagasse as combustible. This work applies the techniques of simulation and economic analysis to different configuration of plants, to determine power generation and associated costs of each alternative. The application of the same procedure at operating condition of several configurations in transient system permits the determination of production profile of exceeding during one day. (C.M.).

25 ENERGY STORAGE

2506 Thermal

10111 (DTU-LV-MEDD–272) **Temperature stratification in heat storage facilities.** Fagerlund Carlsson, P. Danmarks Tekniske Univ., Lyngby (Denmark). Lab. for Varmeisolering. Jan 1995. 92p. (In Danish). Order Number DE95755111. Source: OSTI; NTIS.

The report describes an experimental and theoretical piece of work concerning temperature stratification in heat storage tanks. Heat storage tanks for large solar heating systems are taken as starting point. The upper part of the storage tank is heated by auxiliary energy and the lower part of the storage tank is heated by solar energy. The design of the inlet to the storage tank of the single loops and the size of the volume flow rates have a great influence on the temperature stratification in the storage tank. Tests have been made with five different designs of inlet. The measurements from the test set-up show that a bent leading out the water horizontally along the storage tank wall is the design volume rotate causing of heavy mixing in the storage. Under no circumstances it can be recommended to use a bent as a design of inlet. Direct inlet and perforated pipe can only be recommended at small volume flow rates. The T-piece is a good design of inlet and can be recommended for larger volume flow rates. A numerical calculation

model has been developed for the storage tank. The one-dimensional calculation model calculates the temperature stratification of the use of a various number of fully mixed layers which can change size as well as placing from time step to time step. Results from the calculation model compared with measurements show a satisfactory similarity. (EG) (18 refs.)

10112 (PNL-SA–24000) **Optimizing the design and operation of aquifer thermal energy systems.** Vail, L.W.; Jenne, E.A. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9411190–1: International symposium on aquifer thermal energy storage conference, Tuscaloosa, AL (United States), 14-16 Nov 1994). Order Number DE95007157. Source: OSTI; NTIS; GPO Dep.

The design of Aquifer Thermal Energy Storage (ATES) systems is complicated by significant uncertainties in ones ability to reliably predict the response of the aquifer to fluid and thermal fluxes. Overdesigning the system, to compensate for these uncertainties, reduces the potential economic and energy benefits of an ATES system. Underdesigning the system results in systems that fail to meet design targets. Unfortunately, standard aquifer characterization methods and hydrologic models do not provide adequate information to overcome these uncertainties. Thus, expensive full-scale tests are generally recommended to develop an adequate-understanding of the systems response. However, the standard engineering "design-build-operate" process is not. appropriate for ATES systems because an optimal design cannot be completed without some operational experience, i.e., field tests. A more adaptive engineering process is required. This engineering process should be flexible enough to allow the design to be adjusted during the operation, as monitoring data become available and as an understanding of the system response increases. Engineering approaches being developed for environmental restoration of contaminated soil and groundwater can be adapted to optimally design and operate ATES systems.

2509 Batteries

Refer also to citation(s) 10313

10113 (NREL/TP–463-7540) **Current status of environmental, health, and safety issues of lithium polymer electric vehicle batteries.** Corbus, D.; Hammel, C.J. National Renewable Energy Lab., Golden, CO (United States). Feb 1995. 76p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004005. Source: OSTI; NTIS; GPO Dep.

Lithium solid polymer electrolyte (SPE) batteries are being investigated by researchers worldwide as a possible energy source for future electric vehicles (EVs). One of the main reasons for interest in lithium SPE battery systems is the potential safety features they offer as compared to lithium battery systems using inorganic and organic liquid electrolytes. However, the development of lithium SPE batteries is still in its infancy, and the technology is not envisioned to be ready for commercialization for several years. Because the research and development (R&D) of lithium SPE battery technology is of a highly competitive nature, with many companies both in the United States and abroad pursuing R&D efforts, much of the information concerning specific developments of lithium SPE battery technology is proprietary. This report is based on information available only through the open literature (i.e., information available through library searches). Furthermore, whereas R&D activities for lithium SPE cells have focused on a number of different chemistries, for both electrodes and electrolytes, this report examines the general environmental, health, and safety (EH&S) issues common to many lithium SPE chemistries. However, EH&S issues for specific lithium SPE cell chemistries are discussed when sufficient information exists. Although lithium batteries that do not have a SPE are also being considered for EV applications, this report focuses only on those lithium battery technologies that utilize the SPE technology. The lithium SPE battery technologies considered in this report may contain metallic lithium or nonmetallic lithium compounds (e.g., lithium intercalated carbons) in the negative electrode.

10114 (SAND–94-1870C) **Electrolyte effects in LI(SI)/FeS_2 thermal batteries.** Guidotti, R.A.; Reinhardt, F.W. Sandia National Labs., Albuquerque, NM (United States). [1994]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950461–1: 19. international power sources symposium, Brighton (United Kingdom), 24-26 Apr 1995). Order Number DE95001614. Source: OSTI; NTIS; GPO Dep.

The most common electrochemical couple for thermally activated ("thermal") batteries is the Li-alloy/FeS_2 system. The most common Li-alloys used for anodes are 20% Li-80% Al and 44% Li-56% Si (by weight); liquid Li immobilized with iron powder has also been used. The standard electrolyte that has been used in thermal batteries over the years is the LiCl-KCl eutectic that melts at 352°C. The LiCl-LiBr-LiF eutectic had the best rate and power characteristics. This electrolyte melts at 436°C and shows very low polarization because of the absence of Li+ gradients common with the LiCl-KCl eutectic. The low-melting electrolytes examined included a KBr-LiBr-LiCl eutectic (melting at 321°C), a LiBr-KBr-LiF eutectic (melting at 313°C), and a CsBr-LiBr-KBr eutectic (melting at 238°C). The CsBr-based salt had poor conductivity and was not studied further. The LiBr-KBr-LiF eutectic outperformed the KBr-LiBr-LiCl eutectic and was selected for more extensive testing. Because of their lower melting points and larger liquidi relative to the LiCl-KCl eutectic, the low-melting electrolytes are prime candidates for long-life applications (i.e., for activated lives of one hour or more). This paper will detail the relative performance of the Li(Si)/FeS_2 couple using primarily the LiCl-KCl (standard) eutectic, the LiCl-LiBr-LiF (all-Li) eutectic, and the LiBr-KBr-LiF (low-melting) eutectic electrolytes. Most of the tests were conducted with 5-cell batteries; validation tests were also carried out with appropriate full-sized batteries.

29 ENERGY PLANNING AND POLICY

2901 Energy Analysis and Modeling

10115 (DOE/EIA–0554(95)) **Supplement to the annual energy outlook 1995.** USDOE Energy Information Administration, Washington, DC (United States). Office of Integrated Analysis and Forecasting. Feb 1995. 295p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95007318. Source: OSTI; NTIS; GPO; GPO Dep.

This section of the Supplement to the Annual Energy Outlook 1995 present the major assumptions of the modeling system used to generate the projections in the Annual Energy Outlook 1995 (AEO95). In this context, assumptions include general features of the model structure, assumptions concerning energy markets, and the key input data and parameters that are most significant in formulating the model results. Detailed documentation of the modeling system is available in a series of documentation reports listed in Appendix B. A synopsis of the National Energy Modeling System (NEMS), the model components, and the interrelationships of the modules is presented. The NEMS is developed and maintained by the office of Integrated Analysis and Forecasting of the Energy Information Administration (EIA) to provide projection of domestic energy-economy markets in the midterm time period and perform policy analyses requested by various government agencies and the private sector.

10116 (ETDE-DE–30) **Numerical computation of optimal reduction of CO2 emissions for a simplified climate economy model.** Hamburger Beitraege zur Angewandten Mathematik. Reihe C. Mathematische Modelle und Simulation, v. 7. Oberle, H.J. (Hamburg Univ. (Germany). Inst. fuer Angewandte Mathematik); Storch, H. von; Tahvonen, O. Hamburg Univ. (Germany). Inst. fuer Angewandte Mathematik. Sep 1994. 18p. Order Number DE95756079. Source: OSTI; NTIS (US Sales Only).

In this paper a highly simplified model is considered which describes the interaction of anthropogenic climate changes represented by the influences due to the enhanced emission of CO_2 resulting in the increase of the averaged surface air temperature

on one side, and the economical effects described by the abatement costs for the reduction of emissions on the other side. The model is formulated as a linear-quadratic optimal control problem with a compact control region. By applying the standard necessary conditions, a multipoint-boundary-value problem is derived and its numerical solution obtained by multiple-shoot technique is presented. Special attention is paid to the computation of the reachable set of the system and to the dependence of the control structure on the final state prescribed. In order to smooth a certain irregular behaviour of the solutions near the end of the arbitrarilly fixed time-interval, and additional monotonicity constraint for the CO_2-concentration is introduced. Solutions of this extended optimal control problem are presented too and they are compared with the former solutions. (orig.)

10117 (NEI-DK–1854) **Planning tools for heat and power production.** IMM-EKS, 1994-26. Soendergren, C. Danmarks Tekniske Univ., Lyngby (Denmark). Inst. for Matematisk Modellering. 1994. 191p. Order Number DE95755092. Source: OSTI; NTIS.

The problem considered concerns expansion planning for combined heat and power systems. The purpose is in co-operation with ELKRAFT to develop a new method for production costing simulation. This is done by extending the probabilistic approach for power generation simulation which is a standard method in the literature, to include heat generation as well. The probabilistic approach is built up on two-dimensional load density curves. By convolution of the combined heat and power units, the equivalent load curves are obtained and the expected energy generation of the units, the expected unserved energy, and the expected overflow are determined. These values will be the ones used for expansion planning for the heat and power generation. The results from this model are compared with those obtained form two already at ELKRAFT used simulation models, POB and SIVAEL. (au) (12 refs.)

10118 (CONF-940894–1) **Perspectives on economics and ecology.** O'Neill, R.V. Oak Ridge National Lab., TN (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Annual Ecological Society of America (ESA) meeting: science and public policy; Knoxville, TN (United States); 7-11 Aug 1994. Order Number DE95007050. Source: OSTI; NTIS; GPO Dep.

As we move toward the twenty-first century, the overlap and synergism between economics and ecology demands our scientific attention. But in the intellectual excitement of seeing this new field emerge, we must not lose sight of the underlying global dynamics that are driving the pending merger. Simply stated: the population bomb has not been defused. The media and ecologists have simply fatigued of repeating the obvious. The combination of human population growth and increasing per capita impact is placing irreconcilable demands on the global biotic system. We can reduce per capita demands with technology and recycling. But such strategies simply delay the inevitable unless the human population asymptotes. of course, the population will reach a limit. The choice is between a series of global crises and a reasoned plan for the future. But for Global Sustainability to avoid becoming a cruel and unattainable fantasy, plans must include human population control and economics.

10119 (FEMP–2382) **DOE's perspective: Reaching success by standing on a three legged stool.** Hamric, J.P.; Morgan, K.L. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. 31 Jan 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950216–27: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95006759. Source: OSTI; NTIS; GPO Dep.

Gridlock, inertia, conflict, outrage, bureaucracy, obstruction, media sensationalizing, courts, and politicians. These are the things that characterize any attempt to implement a public policy today. It is worse today than it has ever been because the middle has dropped out of public opinion. We have today no consensus of public values. At Fernald, we have come to recognize that in order to achieve any success we must first build a public consensus about what success will look like. We do this through a three-part approach we call the three legged stool. It includes public information, management involvement, and person-to-person communication. Each of these elements is essential.

10120 (INIS-mf–15093) **Economic efficiency of CO_2 reduction programs.** Report - Max-Planck-Institut fuer Meteorologie, v. 105. Tahvonen, O. (Max-Planck-Institut fuer Meteorologie, Hamburg (Germany)); Storch, H. von; Storch, J. von. Max-Planck-Institut fuer Meteorologie, Hamburg (Germany). May 1993. 30p. Order Number DE95746708. Source: OSTI; NTIS (US Sales Only); INIS.

A highly simplified time-dependent low-dimensional system has been designed to describe conceptually the interaction of climate and economy. Enhanced emission of carbon dioxide (CO_2) is understood as the agent that not only favors instantaneous consumption but also causes unfavorable climate changes at a later time. The problem of balancing these two counterproductive effects of CO_2 emissions on a finite time horizon is considered. The climate system is represented by just two parameters, namely a globally averaged near-surface air-temperature and a globally averaged troposheric CO_2 concentration. The costs of abating CO_2 emissions are monitored by a function which depends quadratically on the percentage reduction of emission compared to an 'uncontrolled emission' scenario. Parameters are fitted to historical climate data and to estimates from studies of CO_2 abatement costs. Two optimization approaches, which differ from earlier attempts to describe the interaction of economy and climate, are discussed. In the 'cost oriented' strategy an optimal emission path is identified which balances the abatement costs and explicitly formulated damage costs. These damage costs, whose estimates are very uncertain, are hypothesized to be a linear function of the time-derivative of temperature. In the 'target oriented' strategy an emission path is chosen so that the abatement costs are minimal while certain restrictions on the terminal temperature and concentration change are met. (orig.)

10121 (PNL-SA–24776) **Impact of the Demand-Side Management (DSM) Program structure on the cost-effectiveness of energy efficiency projects.** Stucky, D.J.; Shankle, S.A.; Dixon, D.R.; Elliott, D.B. Pacific Northwest Lab., Richland, WA (United States). Dec 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941218–3: 17. world energy engineering congress and the 4th environmental technology congress and expo, Atlanta, GA (United States), 7-9 Dec 1994). Order Number DE95007274. Source: OSTI; NTIS; GPO Dep.

Pacific Northwest Laboratory (PNL) analyzed the cost-effective energy efficiency potential of Fort Drum, a customer of the Niagara Mohawk Power Corporation (NMPC) in Watertown, New York. Significant cost-effective investments were identified, even without any demand-side management (DSM) incentives from NMPC. Three NMPC DSM programs were then examined to determine the impact of participation on the cost-effective efficiency potential at the Fort. The following three utility programs were analyzed: (1) utility rebates to be paid back through surcharges, (2) a demand reduction program offered in conjunction with an energy services company, and (3) utility financing. Ultimately, utility rebates and financing were found to be the best programs for the Fort. This paper examines the influence that specific characteristics of the DSM programs had on the decision-making process of one customer. Fort Drum represents a significant demand-side resource, whose decisions regarding energy efficiency investments are based on life-cycle cost analysis subject to stringent capital constraints. The structures of the DSM programs offered by NMPC affect the cost-effectiveness of potential efficiency investments and the ability of the Fort to obtain sufficient capital to implement the projects. This paper compares the magnitude of the cost-effective resource available under each program, and the resulting level of energy and demand savings. The results of this analysis can be used to examine how DSM program structures impact the decision-making process of federal and large commercial customers.

10122 (PNL-SA–25440) **Developing prototype indicators of value and costs added through public involvement programs.** Lach, D.; Hixson, P.; Silbernagel, M.; Branch, K.; Heerwagen, J.; Bradbury, J. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95005724. Source: OSTI; NTIS; GPO Dep.

As more managers realize that public input in public sector decision making is a given in the current political and social climate, many are turning to public involvement (PI) as a way to manage the input so that it is beneficial to their decisions and projects. Public involvement is starting to become a familiar way of doing business for the Department of Energy (DOE) and its contractors. DOE and contractors are still unclear about the value and costs that PI can provide to their projects. Proponents claim that PI increases the acceptability of project goals by increasing stakeholders knowledge about and involvement in decisions of importance to them. In spite of these assertions avowing the benefits of PI, proponents have not generated methods that demonstrate or provide evidence of the value added through incorporating PI into projects. As DOE and contract managers are increasingly directed to incorporate public input in their project planning and decision making, questions are beginning to surface about the value and costs of PI as a way to manage that input. There is a pressing need to document the value and costs of PI for the participants in these processes–the stakeholders–and to present this information to decision makers in a way that helps them assess the value and costs of managing public input through a PI program. This research project focuses on developing a series of indicators to assess the value and costs of using public involvement programs to manage public input in decision making processes. The dimensions of public involvement that participants perceive as adding value or costs to projects; and developing ways to measure those dimensions through social indicators and metrics of behavior are outlined.

10123 (RR–91-7) **USSR energy efficiency and prospects.** Sinyak, Y. International Inst. for Applied Systems Analysis, Laxenburg (Austria). Jun 1991. 30p. Order Number DE95622003. Source: OSTI; NTIS (US Sales Only); INIS.

Reprinted from: Energy, v. 16(5) p. 791-815, 1991.

The U.S.S.R. is the largest energy producer and the second largest energy consumer in the world. Its share of global energy use reached above 17% in 1988. The soviet energy system is characterized by low efficiency and high per capita energy consumption, although there are some reasons justifying the greater U.S.S.R. energy use per unit of product output than in other industrialized countries. The present energy-savings potential is approximately equal to one-half of the domestic energy consumption. Improvements in energy efficiency at all levels of the national economy are now considered to be the primary goal of national energy policy for the next couple of decades. Being endowed with abundant natural gas resources, the U.S.S.R. will count on this energy source in the future to improve its energy efficiency, reduce expenses and cope with air pollution. After 2005-2010, stabilized primary energy consumption may be reached or there may even be a decline of total energy use. The U.S.S.R. could reduce CO_2 emissions by 20% by 2030 but with substantial negative impacts on GNP growth. Required improvements in the Soviet energy system depend on changes in energy management, including reduction of the role of centralized planning, decentralization and privatization of energy-producing facilities, energy-price reforms, reshaping of investment patterns, reduction in military expenditures, etc. (author).

10124 (SA-PUB–1/94, pp. 393-398) **Economic effects of restricting carbon dioxide emissions.** Haaparanta, P. (Helsinki School of Economics (Finland). Dept. of Economics); Jerkkola, J.; Pohjola, J. Academy of Finland, Helsinki (Finland). 1994. In *The Finnish research programme on climate change. Second progress report.* 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

The aim of this study is to evaluate the economy-wide effects of reducing CO_2 emissions. NO_x and SO_2 emissions can also be included. The policy questions can be approached either by estimating the emission taxes needed to achieve the given levels of emissions or by estimating the level of emissions given the level of taxes. A computable general equilibrium (CGE) is used in this analysis. The general equilibrium models deal with long-run effects, after all markets have equilibrated and all resources are optimally used. They are particularly well-suited to analyze long-run resource allocation, welfare losses and income distribution, beyond the short-run macroeconomic disturbances and business cycle phenomena. As the general equilibrium framework integrates all main economic sectors, the feedbacks and interrelationships between the various sectors are taken into account.

10125 (SA-PUB–1/94, pp. 399-404) **An analysis of the economic effects of global warming on Finland.** Kuoppamaeki, P. (Research Inst. of the Finnish Economy, Helsinki (Finland)). Academy of Finland, Helsinki (Finland). 1994. In *The Finnish research programme on climate change. Second progress report.* 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

The purpose of the project concerned is to evaluate the potential influence of global warming on Finnish economy and well-being during the next 50 to 100 years. In order to achieve this goal a cost-benefit analysis will be conducted which produces a quantitative estimate of the economic and partially non-economic effects of the climate change projected to happen in Finland. The analysis will utilise the natural scientific evidence produced by other SILMU projects in partial sector models. Also a broader view of the phenomena and the possibilities for restricting greenhouse gas emissions will be briefly discussed and surveyed. However, as the project has just begun this article concentrates on methodological issues and a survey of literature.

10126 (ANL/EA/CP–84367) **How technology is improving decision making for environmental restoration.** Ditmars, J. Argonne National Lab., IL (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9411181–1: Earthcare conference, Toulouse (France), 8-10 Nov 1994). Order Number DE95005851. Source: OSTI; NTIS; GPO Dep.

Environmental restoration, or the cleanup of contaminants from past activities, at its core depends on a series of decisions about the nature and extent of contamination, the risk to human health and the environment, and the potential effectiveness of remediation techniques and technologies to reduce the risk to acceptable levels. The effectiveness with which these decisions are made has significant impacts on the cost and duration of the cleanup efforts. The decisions must often be made on the basis of incomplete and uncertain data. Emerging environmental information and data acquisition technologies together with appropriate strategies to support decision making are beginning to change the way environmental restoration occurs in the United States. Past environmental restoration activities too often relied on prescriptive data collection activities to generate the information upon which decisions were to be made. Retrospective studies of such activities have shown that, while often data were gathered for the purpose of reducing the risk in decision making, little true reduction in risk was realized and large amounts of resources were consumed. Recent examination of the failures in the United States to achieve many complete cleanups despite the investment of large sums and time points to the inability to have decisions made efficiently. The solution to the problem involves both regulatory change to allow more flexibility in decision-making and the introduction of technology to improve decision making. This paper reviews the recent assessments made of the cleanup process and application of strategies and technologies to enhance decision-making for cleanup. It provides examples of the new decision approaches and the technologies that have been employed to speed up characterization and to optimize the implementation of remediation.

10127 (CONF-9205430–Summ.) **New Land disposal restrictions for contaminated soil and debris, and newly identified toxicity characteristic organic wastes.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Environmental Guidance. May 1992. 29p. Sponsored by USDOE, Washington, DC (United States). From HAZTECH international conference; Pittsburgh, PA (United States); 12-14 May 1992. Order Number DE95005352. Source: OSTI; NTIS; GPO Dep.

The applicability of the Resource Conservation and Recovery Act (RCRA) Land Disposal Restrictions (LDR) program to radioactive mixed wastes (RMW) has been clarified through US Environmental Protection Agency (EPA) and US Department of Energy (DOE) rulemakings and notices. However, a number of waste management concerns involving RMW and RMW-contaminated soil and debris continue to exist with respect to achieving compliance with LDR provisions and treatment standards. Consequently, DOE has become increasingly proactive in its participation in the LDR rulemaking process and in the identification of LDR compliance issues associated with its RMW inventories. Both data and recommendations from across the DOE complex have been collected and transmitted to EPA in response to proposed requirements that would implement LDR for contaminated soil and debris, and certain newly identified toxicity characteristic (TC) organic wastes. Much of this information focused on concerns related to the application of proposed regulatory approaches to RMW streams. Some highlights from the information included in these DOE responses are presented.

10128 (DOE–95007547) **Environmental Guidance regulatory bulletin.** Powers, J. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). RCRA/CERCLA Div. 31 Dec 1994. 2p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI.

This bulletin contains information pertaining to the revisions that have been made to the Emergency Planning and Community Right-to-Know Act of 1986. The Environmental Protection Agency added 286 chemicals and 39 chemicals as part of two delineated categories. In adding these new chemicals and chemical categories, EPA has exercised its authority to add chemicals based on their acute human health effects, carcinogenicity or other chronic human health effects, and/or their adverse effects on the environment.

10129 (DOE/CE/23810–49) **Materials Compatibility and Lubricants Research (MCLR) Program.** Szymurski, S.R. Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States). Dec 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. (CONF-941250–1: 1994 international symposium on R-22 and R-502 alternative refrigerants, Kobe (Japan), 8-9 Dec 1994). Order Number DE95004862. Source: OSTI; NTIS; GPO Dep.

Objective is to accelerate phaseout of CFC refrigerants. Since its start in 1991, the MCLR program has initiated twenty-five research projects and the ARTI Refrigerant Database. The MCLR program is now entering its final phase. This phase will include over a dozen new research projects which will be completed in the next two years. This presentation highlights accomplishments of the MCLR program and outlines new projects to be conducted in the final phase.

10130 (DOE/EH–0396P-Vol.1) **Chemical Safety Vulnerability Working Group report. Volume 1.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Chemical Safety Vulnerability Working Group. Sep 1994. 79p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006870. Source: OSTI; NTIS; INIS; GPO Dep.

The Chemical Safety Vulnerability (CSV) Working Group was established to identify adverse conditions involving hazardous chemicals at DOE facilities that might result in fires or explosions, release of hazardous chemicals to the environment, or exposure of workers or the public to chemicals. A CSV Review was conducted in 148 facilities at 29 sites. Eight generic vulnerabilities were documented related to: abandoned chemicals and chemical residuals; past chemical spills and ground releases; characterization of legacy chemicals and wastes; disposition of legacy chemicals; storage facilities and conditions; condition of facilities and support systems; unanalyzed and unaddressed hazards; and inventory control and tracking. Weaknesses in five programmatic areas were also identified related to: management commitment and planning; chemical safety management programs; aging facilities that continue to operate; nonoperating facilities awaiting deactivation; and resource allocations. Volume 1 contains the Executive summary; Introduction; Summary of vulnerabilities; Management systems weaknesses; Commendable practices; Summary of management response plan; Conclusions; and a Glossary of chemical terms.

10131 (DOE/EH–0396P-Vol.2) **Chemical Safety Vulnerability Working Group report. Volume 2.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Chemical Safety Vulnerability Working Group. Sep 1994. 238p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006871. Source: OSTI; NTIS; INIS; GPO Dep.

The Chemical Safety Vulnerability (CSV) Working Group was established to identify adverse conditions involving hazardous chemicals at DOE facilities that might result in fires or explosions, release of hazardous chemicals to the environment, or exposure of workers or the public to chemicals. A CSV Review was conducted in 146 facilities at 29 sites. Eight generic vulnerabilities were documented related to: abandoned chemicals and chemical residuals; past chemical spills and ground releases; characterization of legacy chemicals and wastes; disposition of legacy chemicals; storage facilities and conditions; condition of facilities and support systems; unanalyzed and unaddressed hazards; and inventory control and tracking. Weaknesses in five programmatic areas were also identified related to: management commitment and planning; chemical safety management programs; aging facilities that continue to operate; nonoperating facilities awaiting deactivation; and resource allocations. To address the facility-specific and site-specific vulnerabilities, responsible DOE and site-contractor line organizations have developed initial site response plans. These plans, presented as Volume 2 of this Management Response Plan, describe the actions needed to mitigate or eliminate the facility- and site-specific vulnerabilities identified by the CSV Working Group field verification teams. Initial site response plans are described for: Brookhaven National Lab., Hanford Site, Idaho National Engineering Lab., Lawrence Livermore National Lab., Los Alamos National Lab., Oak Ridge Reservation, Rocky Flats Plant, Sandia National Laboratories, and Savannah River Site.

10135 (DOE/EH–0441) **Reporting continuous releases of hazardous and extremely hazardous substances under CERCLA and EPCRA.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Jan 1995. 47p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95007545. Source: OSTI; NTIS; INIS; GPO Dep.

This guidance is designed to provide basic instruction to US DOE and DOE operations contractor personnel on how to characterize CERCLA and EPCRA hazardous substance releases as continuous and how to prepare and deliver continuousreleasee reports to Federal, State, and local authorities. DOE staff should use this guidance as an overview of the continuous release requirements, a quick ready reference guide for specific topics concerning continuous releases and a step-by-step guide for the process of identifying and reporting continuous releases.

10136 (DOE/EIS–0161) **Draft programmatic environmental impact statement for tritium supply and recyling. Executive summary.** USDOE Assistant Secretary for Defense Programs, Washington, DC (United States). Office of Reconfiguration. Feb 1995. 58p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95007892. Source: OSTI; NTIS; GPO Dep.

In January 1991, the Secretary of Energy announced that the Department of Energy (DOE) Office of the Assistant Secretary for Defense Programs (DP) would prepare a programmatic environmental impact statement (PEIS) examining alternatives for the reconfiguration of the Nation's Nuclear Weapons Complex (Complex). The framework for the Reconfiguration PEIS was described in the January 1991 Nuclear Weapons Complex Reconfiguration Study, a detailed examination of alternatives for the future Complex. Because of the significant changes in the world since January 1991, especially with regard to projected future requirements for the United States nuclear weapons stockpile, the framework described in the Nuclear Weapons Reconfiguration Study does not exist today. Therefore, the Department separated the Reconfiguration PEIS into two PEISs: a Tritium Supply and Recycling PEIS; and a Stockpile Stewardship and Management PEIS. The Tritium Supply and Recycling Action is analyzed in this PEIS. Tritium supply deals with the production of new tritium and the subsequent extraction of the tritium in pure form for its use in nuclear weapons. Tritium recycling consists of recovering residual tritium from weapons components, purifying it, and refilling weapons components with both recovered and new tritium when it becomes available. The Tritium Supply and Recycling Action is analyzed in this PEIS. The PEIS assess the environmental impacts of all reasonable alternatives, including no action. Additionally, the PEIS includes an assessment of the environmental and institutional impacts associated with using one or more commercial light water reactors for tritium production as a contingency in the event of a national emergency. This PEIS also addresses the environmental impacts of an ALWR or modular gas-cooled reactor used as a multipurpose reactor.

10137 (DOE/MC/29467–3952) **Waste Management Education and Research Consortium (WERC), National Environmental Design. Topical report.** Reed, B.E. West Virginia Univ. Research Corp., Morgantown, WV (United States). Oct 1994. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC29467. Order Number DE95000043. Source: OSTI; NTIS; GPO Dep.

The 4th Annual Waste-Management Education and Research Consortium (WERC) for National Environmental Design was held on April 10–14 in Las Cruces, New Mexico. The purpose of the WERC is to train students in the area of site remediation and restoration. Consistent with the Cooperative Agreement's 3rd Task, the ultimate goal of WERC is to provide training for potential engineers and scientists for the DOE's remediation and restoration efforts. WERC is sponsored by the Department of Energy and is housed at New Mexico State University. Two student groups from West Virginia University's Department of Civil and Environmental Engineering traveled to New Mexico. Group 1 was composed of graduate students and Group 2 was composed of undergraduate students. Students who participated in this program were exposed to all aspects of the solution of a real life environmental problem.

10138 (DOE/PO–0028-Vol.1) **Voluntary reporting of greenhouse gases under Section 1605(b) of the Energy Policy Act of 1992: General Guidelines.** USDOE, Washington, DC (United States). Oct 1994. 27p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95003295. Source: OSTI; NTIS; INIS; GPO Dep.

Because of concerns with the growing threat of global climate change from increasing emissions of greenhouse gases, Congress authorized a voluntary program for the public to report achievements in reducing those gases. This document offers guidance on recording historic and current greenhouse gas emissions, emissions reductions, and carbon sequestration. Under the Energy Policy Act (EPAct) reporters will have the opportunity to highlight specific achievements. If you have taken actions to lessen the greenhouse gas effect, either by decreasing greenhouse gas emissions or by sequestering carbon, the Department of Energy (DOE) encourages you to report your achievements under this program. The program has two related, but distinct parts. First, the program offers you an opportunity to report your annual emissions of greenhouse gases. Second, the program records your specific projects to

reduce greenhouse gas emissions and increase carbon sequestration. Although participants in the program are strongly encouraged to submit reports on both, reports on either annual emissions or emissions reductions and carbon sequestration projects will be accepted. These guidelines and the supporting technical documents outline the rationale for the program and approaches to analyzing emissions and emissions reduction projects. Your annual emissions and emissions reductions achievements will be reported.

10139 (DOE/PO–0028-Vol.2) **Sector-specific issues and reporting methodologies supporting the General Guidelines for the voluntary reporting of greenhouse gases under Section 1605(b) of the Energy Policy Act of 1992. Volume 1: Part 1, Electricity supply sector; Part 2, Residential and commercial buildings sector; Part 3, Industrial sector.** USDOE, Washington, DC (United States). Oct 1994. 239p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95003296. Source: OSTI; NTIS; INIS; GPO Dep.

DOE encourages you to report your achievements in reducing greenhouse gas emissions and sequestering carbon under this program. Global climate change is increasingly being recognized as a threat that individuals and organizations can take action against. If you are among those taking action, reporting your projects may lead to recognition for you, motivation for others, and synergistic learning for the global community. This report discusses the reporting process for the voluntary detailed guidance in the sectoral supporting documents for electricity supply, residential and commercial buildings, industry, transportation, forestry, and agriculture. You may have reportable projects in several sectors; you may report them separately or capture and report the total effects on an entity-wide report.

10140 (DOE/PO–0028-Vol.3) **Sector-specific issues and reporting methodologies supporting the General Guidelines for the voluntary reporting of greenhouse gases under Section 1605(b) of the Energy Policy Act of 1992. Volume 2: Part 4, Transportation sector; Part 5, Forestry sector; Part 6, Agricultural sector.** USDOE, Washington, DC (United States). Oct 1994. 190p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95003297. Source: OSTI; NTIS; INIS; GPO Dep.

This volume, the second of two such volumes, contains sector-specific guidance in support of the General Guidelines for the voluntary reporting of greenhouse gas emissions and carbon sequestration. This voluntary reporting program was authorized by Congress in Section 1605(b) of the Energy Policy Act of 1992. The General Guidelines, bound separately from this volume, provide the overall rationale for the program, discuss in general how to analyze emissions and emission reduction/carbon sequestration projects, and address programmatic issues such as minimum reporting requirements, time parameters, international projects, confidentiality, and certification. Together, the General Guidelines and the guidance in these supporting documents will provide concepts and approaches needed to prepare the reporting forms. This second volume of sector-specific guidance covers the transportation sector, the forestry sector, and the agricultural sector.

10141 (EGG-M–94112) **Stormwater management at the ARID INEL.** Walker, E.D. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1994]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9405126–4: EG&G GOCO environmental conference, Las Vegas, NV (United States), 10-12 May 1994). Order Number DE95005030. Source: OSTI; NTIS; INIS; GPO Dep.

NPDES stormwater permits are required for stormwater discharges to waters of the US (WUS). The Idaho National Engineering Laboratory (INEL) applied for coverage under a general NPDES stormwater permit because there is some potential for stormwater discharge to the Big Lost River System, which could infiltrate to groundwater. The main requirements of the permit are to prevent contaminants from coming into contact with stormwater and prevent contaminated stormwater from running off of facilities into WUS or groundwater. All INEL major facility areas have prepared and implemented stormwater pollution prevention plans (SWPPPs). The INEL also applied for coverage under a separate NPDES general permit for stormwater discharges from construction sites. An INEL Generic SWPPP for construction activities was prepared and implemented for all construction projects at the INEL.

10142 (ENEA-RT-AMB–93-24) **Environmental analysis in two manufacturing firms of Civita Castellana disctrict (Italy).** Salerno, S. (ENEA, Casaccia (Italy). Area Energia Ambiente e Salute); Dai Pra', L.; Delle Fratte, A. ENEA, Casaccia (Italy). Area Energia Ambiente e Salute. Dec 1994. 104p. (In Italian). (RT/AMB–93-24). Order Number DE95749707. Source: OSTI; NTIS (US Sales Only).

This is an interdisciplinary research that drives straight foreward to the complex relationship of well-being at work. The final objective of the research is prevention and health promotion in the Civita Castellana small pottery industries area which is involved in an increase technological change. It is analized two pottery firms (one of table-ware and one of sanitary-ware) by the Method of Organizational Congruences (MOC) (Maggi, 1984, 1990) applied in Ergonomics for studying organization and well-being (Maggi, Grieco, 1986). This method allows to identify the Organizational Constraints (OC) as a reduction of individual liberty of action due to organizational choice. Tableware (25%) and sanitaryware (44%) are the most representitive production of the Civita Castellana district. It is studied manually sanitary-ware production, caracterized by storehouse; clay and enamels preparation; molding by clay casting; testing; enamelling; firing and selecting, and a half-automated tableware production mostly caracterized by storehouse, clay and enamel preparation; filter pressing; automated molting; firing biscuitware; manually and automatic decoration; enamelling; double firing and final touches. The MOC has an analytical point of view so it is impossible to synthetize in few words the whole different OC observed. For this reason it is choosen the most important and typical ones. In sanitary-ware factory are: silica powder, work load, inadequate posture, high-speed self rhytm and repetition of simple task, working hours (4 a.m. -11 a.m.); microclimate and noise in enamelling area. In table-ware factory are: noise and compulsory rhytm due to automatic machine, repetition of simple task requiring attention mostly in the decoration area, solvents, microclimate, inadequate posture, workload and silica powder (less than sanitary-ware). (Abstract Truncated)

10143 (ETDE-DE–17) **Dioxin factories. A study on the formation and dispersion of dioxins and other organic compounds of chlorine in PVC production.** Wang-Anderson, G.; Keys, J.; Edwards, B.; Krautter, M. Greenpeace e.V., Hamburg (Germany). May 1993. 39p. (In German). Order Number DE95746659. Source: OSTI; NTIS (US Sales Only).

The report is also published in English.

Greenpeace has collected and analysed studies and research data on PVC production sites from four European countries in order to examine actual or possible emissions of dioxins and other organic compounds of chlorine in the production of dichloroethane (EDC) and vinyl chloride (VC). This study reveals alarmingly high emissions of organic compounds of chlorine, especially of highly toxic dioxin, from these PVC plants. (orig./EF)

10144 (FEMP–2383) **The task force process.** Applegate, J.S. (Univ. of Cincinnati, OH (United States)). Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. 31 Jan 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950216–29: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95006760. Source: OSTI; NTIS; INIS; GPO Dep.

This paper focuses on the unique aspects of the Fernald Citizens Task Force process that have contributed to a largely successful public participation effort at Fernald. The Fernald Citizens Task Force passed quickly by many procedural issues. Instead, the Task Force concentrated on (a) educating itself about the site, its problems, and possible solutions, and (b) choosing a directed way to approach its mandate: To make recommendations on several "big picture" issues, including future use of the site, cleanup levels, waste disposition, and cleanup priorities. This paper presents the approach used at Fernald for establishing and running a focused site-specific advisory board, the key issues that have been faced, and how these issues were resolved. The success of Fernald in establishing a strong and functioning site-specific advisory board

serves as a useful model for other DOE facilities, although the Fernald model is just one of many approaches that can be taken. However, the approach presented here has worked extremely well for Fernald.

10145 (GSF–13/94) **Between legal counseling and administrative functions. Municipal commissioners for pollution abatement, and ecocounseling. Vol. 3.** Koller, U. (comp.); Reitemeyer, E. (comp.); Haury, H.J. (comp.). GSF - Forschungszentrum fuer Umwelt und Gesundheit Neuherberg GmbH, Oberschleissheim (Germany). Jun 1994. 148p. (In German). (CONF-9402126–: Meeting of the Zentrale Umweltberatung Bayern together with the Evangelische Akademie Tutzing: Between legal counseling and administrative functions - municipal commissioners for pollution abatement,, Muenchen (Germany), 28 Feb - 1 mar 19 Order Number DE95746586. Source: OSTI; NTIS (US Sales Only).

This meeting of February 1994 was dedicated to detailed discussions of the scope of responsibilities of municipal commissioners for pollution abatement and of experiences gained so far from different points of view. Ideas and views were exchanged on the self-image of municipal commissioners for pollution abatement and on the deficiencies, obstacles and resulting future tasks and prospects as combined with different administrative functions. The acquisition of information for commissioners for pollution abatement was another point-of-main effort topic within the framework of the meeting. (orig.)

10146 (INIS-mf–15089) **Umweltbundesamt. Annual report 1993.** Brackemann, H. (comp.); Rehring, R. (comp.). Umweltbundesamt, Berlin (Germany). [1994]. 353p. (In German). Order Number DE95746450. Source: OSTI; NTIS (US Sales Only); INIS.

The most urgent task in 1993 was to consider the economic and labour-political repercussions of environmental protection measures. In the opinion of the Environmental Protection Agency the question of whether we can afford environmental protection in times of economic crisis is flawed. The question is rather: is it reasonable to waive the further development of environmental protection in view of the need to safeguard Germany's international rank as an industrial nation? The reason being that active environmental protection, while imposing relatively low costs on enterprises, yields high national economic benefits and results in higher international attractivity. Moreover, if the environmental policy is developed further a substantial increase in jobs is to be expected. But 1993 was also the year that important switches were shifted for the future work of the Agency. The concept for its internal reorganization was finalized. Under this scheme, the Agency will be restructured in accordance with its progress in recent years from an "end-of-the-pipe" policy towards integral approaches. In the future, products and process plants will be dealt with by the individual sections of the Agency from the angle of all environmental media concerned. (orig./HP)

10147 (INIS-mf–15096) **Risks and chances of an ecologically oriented energy industry. Revised version of the speech of the Hessian Minister for Environment, Energy and Federal Issues, Joschka Fischer (Die Gruenen), on the occasion of the IZE communication meeting 1992.** Stromdiskussion, v. 181. Kukuck, H.A. (ed.). Informationszentrale der Elektrizitaetswirtschaft e.V. (IZE), Frankfurt am Main (Germany). 1994. 8p. (In German). Order Number DE95752828. Source: OSTI; NTIS (US Sales Only); INIS.

During the 1992 'Discussion Day' of the IZE, held under the motto 'Energy and Environment: Public Relations in the field of tension between economy and ecology', Joschka Fischer, the environment minister of Hessen, delivered an address that met with great attention. It resulted in a lively discussion of his theses with the attendants of the meeting. (orig./UA)

10148 (KCP–613-5545) **Pollution prevention opportunity assessment approach, training, and technical assistance for DOE contractors.** Pemberton, S. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Jan 1995. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE95006176. Source: OSTI; NTIS; GPO Dep.

One of the tools used in a successful pollution prevention program is a pollution prevention opportunity assessment (PPOA). The purpose of this project was to share the Kansas City Plant's (KCP's) PPOA expertise with other Department of Energy (DOE) personnel and DOE contractors. This consisted of five major activities in FY94: (1) Validating DOE's PPOA Graded Approach methodology; (2) Providing DOE-funded PPOA training and technical assistance to interested DOE personnel and DOE contractors; (3) Developing a promotional campaign; (4) Conducting a feasibility study to develop a DOE-wide PPOA information exchange mechanism; and (5) Organizing and coordinating information sharing among related DOE EM-334 pollution prevention projects. This report documents the FY94 efforts, lessons learned, and future plans for all of the PPOA-related activities.

10149 (NEI-DK–1826) **Development and initiatives within the field of energy. Note on status 1994.** Energistyrelsen, Copenhagen (Denmark). 1994. 63p. (In Danish). Order Number DE95744849. Source: OSTI; NTIS.

Environmental considerations are being included in Danish energy policy to an increasing extent. The government has diligently followed the recommendation of the United Nations' World Commission (1987) for the radical reduction of carbon dioxide emission. Since 1990 much effort has been put into energy conservation initiatives. The Danish people support the cause of energy conservation resulting in carbon dioxide emission reduction. During 1994 the effect of taxation on industrial pollutive emission was evaluated and it was found that it was unlikely that the 2005 goal for a 20% CO_2 reduction could not quite be achieved whereas international goals could be met by Denmark. It is recommended that existing initiatives for reducing CO_2 emission must be intensified and that new initiatives are needed in order to achieve goals for pollution abatement. This situation will be considered in detail in connection with the planned revision of energy policy in 1995. The long-term aim is to reduce energy consumption by half. International activities will have a significant effect on possibilities for achieving the Danish goals for energy conservation. It is thus essential for Denmark that a more competitive international market is based on the principle of CO_2 reduction loyally followed by other countries. The status of the follow-up of Danish energy policy of since 1990 is described in addition to an evaluation of the results of the Danish government's CO_2 package, which aimed at producing economical incitements for energy saving, and a description of international developments related to environmental protection. (AB)

10150 (ORNL/M–3271/R5) **Environmental regulatory update table November–December 1994.** Houlberg, L.M.; Hawkins, G.T.; Bock, R.E.; Mayer, S.J.; Salk, M.S. Oak Ridge National Lab., TN (United States). Jan 1995. 112p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95006358. Source: OSTI; NTIS; GPO Dep.

The Environmental Regulatory Update Table provides information on regulatory initiatives of interest to DOE operations and contractor staff with environmental management responsibilities. The table is updated bi-monthly with information from the Federal Register and other sources, including direct contact with regulatory agencies. Each table entry provides a chronological record of the rulemaking process for that initiative with an abstract and a projection of further action.

10151 (PNL-SA–24842) **Carbon taxes and India.** Fisher-Vanden, K.A. (Pacific Northwest Lab., Richland, WA (United States)); Pitcher, H.M.; Edmonds, J.A.; Kim, S.H.; Shukla, P.R. Pacific Northwest Lab., Richland, WA (United States). Jul 1994. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9406269–4: Snowmass 94: particle and astrophysics in the next millenium, Snowmass, CO (United States), 29 Jun - 14 jul 1994). Order Number DE95005401. Source: OSTI; NTIS; INIS; GPO Dep.

Using the Indian module of the Second Generation Model 9SGM, we explore a reference case and three scenarios in which greenhouse gas emissions were controlled. Two alternative policy instruments (carbon taxes and tradable permits) were analyzed to determine comparative costs of stabilizing emissions at (1) 1990 levels (the 1 X case), (2) two times the 1990 levels (the 2X case), and (3) three times the 1990 levels (the 3X case). The analysis

takes into account India's rapidly growing population and the abundance of coal and biomass relative to other fuels. We also explore the impacts of a global tradable permits market to stabilize global carbon emissions on the Indian economy under the following two emissions allowance allocation methods: (1) "Grandfathered emissions": emissions allowances are allocated based on 1990 emissions. (2) "Equal per capita emissions": emissions allowances are allocated based on share of global population. Tradable permits represent a lower cost method to stabilize Indian emissions than carbon taxes, i.e., global action would benefit India more than independent actions.

10152 (RISO-R–794(DA)) **The Nordic Countries interests in principles for international greenhouse gas agreements.** Halsnaes, K.; Meyer, H.; Stephensen, P.; Soerensen, L. Risoe National Lab., Roskilde (Denmark). Systems Analysis. Jan 1995. 108p. (In Danish). Order Number DE95755113. Source: OSTI; NTIS; INIS; Also available on from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

The focus of this report is the interests of the Nordic countries in international agreements on greenhouse gases. The subject is approached mainly from an economic point of view. Introductory, the climate convention are described, with special attention to obligations to emission reductions. Important discussion points are timing of the reductions as well as the question of meeting the reductions by cooperation with other countries through joint-implementation projects. The different attitudes of the Nordic countries to these issues are discussed. In the following, the technical and economic possibilities for meeting the reduction objectives of each country are described. For this purpose, governmental plans and studies (on bottom-up as well as top-down studies) are brought into focus. A discussion of the differences and similarities of the methodology of the studies are carried out. Finally, the report focuses on costs of reducing emissions in the Nordic countries. A comparison between the different Nordic countries, as well as between the Nordic countries and the other OECD countries is done. The analysis points out, that the Nordic countries are characterized by relatively high costs in general. Another conclusion is, that the costs of reduction after the year 2000/2005 are much lower than costs of reductions in the short run. An exception to this is Denmark. This points out, that some Nordic countries prefer emission reductions through joint-implementation projects in other countries, rather than reductions through restrictive agreements in the sort run. (au) (29 tabs., 28 ills., 45 refs.)

10153 (SA-PUB–1/94, pp. 381-386) **Climate change, living environment and ways of life.** Jaervelae, M. (Jyvaeskylae Univ. (Finland). Dept. of Social Policy); Wilenius, M. Academy of Finland, Helsinki (Finland). 1994. In *The Finnish research programme on climate change. Second progress report.* 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

The research project 'Climate Change, Living Environment and Way of Life' is focused on the social concepts of risks and of proposed policies related to global environmental problems as seen by representatives of various social groups. Drawing on the social-scientific methodology and applying its concept apparatus, the research project focuses on two central problems in the field of contemporary environmental research. Firstly, with the way in which environmental problems influence people's values and attitudes. Secondly, with the question of how people seek to act and to show solidarity towards new generations by means of environmental policies or by protecting nature within the framework of their private ways of life.

10154 (SA-PUB–1/94, pp. 387-392) **Economic and game-theoretical analysis of CO_2 reduction agreements.** Tahvonen, O. (Oulu Univ. (Finland). Dept. of Economics). Academy of Finland, Helsinki (Finland). 1994. In *The Finnish research programme on climate change. Second progress report.* 412p. Order Number DE95744863. Source: OSTI; NTIS.

SILMU Research Programme.

The possibility of climate change and suggestions to stabilize CO_2 emissions have led to several different fields of research in resource and environmental economics. These include: 1. Studies on country specific and global greenhouse gas abatement costs. 2. Studies on global and country specific adaptation costs. 3. Game-theoretical analysis of greenhouse gas reduction agreements. 4. Studies on the relationship between CO_2 accumulation and natural resource utilization. 5. Models of climate change and intertemporal efficiency and equity. 6. Studies on emissions taxes and emissions permit markets for greenhouse gas abatement. The aim of this project is to contribute to the economic literature in fields 3, and 4.

10156 (DOE–95005148) **Science for a sustainable future.** USDOE Office of Energy Research, Washington, DC (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005148. Source: OSTI; NTIS; GPO Dep.

Sustainable development holds the promise for a more prosperous and enduring future for all mankind. The scientific enterprise of the Department of Energy's (DOE) research programs promises to develop new technology, as well as to help society better understand the earth, more efficiently use natural resources, and enhance the quality of life. DOE science programs are focused on basic and applied research that provides the foundation for technical and economic advancement. By forming partnerships among universities, national laboratories, and industries across the nation; advanced instrumentation is being developed to better understand the world in which we live-from the atomic to the global scale. These technologies allow us to monitor our resources, to continue to develop our industrial processes, to eliminate hazardous waste, and to avoid or minimize the production of toxic substances. In this way, research is ultimately directed to preserve our environment and to provide the basis for sustained economic growth. To make further advances, investment must continue in national research programs, forging partnerships and bringing the skills and knowledge required in the global marketplace of products and ideas.

10157 (DOE/EIA–0569(94/4Q)) **EIA directory of electronic products fourth quarter 1994.** National Energy Information Center, Washington, DC (United States). 24 Jan 1995. 76p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95008051. Source: OSTI; NTIS; GPO Dep.

The Energy Information Administration (EIA) makes available for public use a series of machine-readable data files and computer models. Data files and models are listed for petroleum, natural gas, electricity, coal, nuclear, and multifuels. The data files and models are made available to the public on magnetic tapes. In addition, selected data files/models are available on diskette for IBM- compatible personal computers. For each product listed in this directory, a detailed abstract is provided which describes the data published. Contact persons and distribution media are listed for each product.

10158 (DOE/ER–0629) **Program solicitation. Closing date: March 1, 1995.** USDOE Office of Energy Research, Washington,

DC (United States). 1995. 99p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005152. Source: OSTI; NTIS; GPO Dep.

This document is a solicitation for small business to participate in innovation research. The Department of Energy (DOE) invites small business concerns to submit grant applications under this thirteenth annual solicitation for the Small Business Innovation Research (SBIR) program. Firms with strong research capabilities in science or engineering in any of the topic areas described in Appendix 1 are encouraged to participate. DOE will support high-quality research or research and development (R and D) on advanced concepts concerning important energy related scientific or engineering problems and opportunities that could lead to significant public benefit if the research is successful. Objectives of this program include increasing private sector commercialization of technology developed through DOE-supported R and D, stimulating technological innovation in the private sector, strengthening the role of small business in meeting Federal research and R and D needs, and improving the return on investment from Federally funded research for economic and social benefits to the Nation.

10159 (DOE/ER–0630) **Small Business Innovation Research: Abstracts of Phase 1 awards, 1994.** USDOE Office of Energy Research, Washington, DC (United States). 1994. 134p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005151. Source: OSTI; NTIS; GPO Dep.

The Small Business Innovation Research (SBIR) program enables DOE to obtain effective, innovative solutions to important problems through the private sector, which has a commercial incentive to pursue the resulting technology and bring it to the marketplace. The growing number of awardees, many of them started in business in response to SBIR solicitations, is becoming a significant resource for the solution of high risk, high technology problems for the Department. As detailed here, this publication describes the technical efforts for SBIR Phase 1 awards in 1994. It is intended for the educated layman, and may be of particular interest to potential investors who wish to get in on the ground floor of exciting opportunities. Contained in this booklet are abstracts of the Phase 1 awards made in FY 1994 under the DOE SBIR program. The 212 Phase 1 projects described here were selected in a highly competitive process from a total of 2,276 grant applications received in response to the 1994 DOE annual SBIR Solicitation. The selections for awards were made on scientific and technical merit, as judged against the specific criteria listed in the Solicitation. Conclusions were reached on the basis of detailed reports returned by reviewers drawn from DOE laboratories, universities, private industry, and government. (Any discrepancies noted in prior DOE releases naming the firms selected for awards are due either to the firm changing its name after the award selection or to the firm not proceeding to a signed grant.) It is expected that between one-third and one-half of the Phase 1 projects will be continued into Phase 2. The work described in the abstracts is novel, high-risk research, but the benefits will also be potentially high if the objectives are met. Brief comments on the potential applications are given after each abstract. Individuals and organizations with an interest in the research described are encouraged to contact the appropriate small business directly.

10160 (DOE/ER/75498–T4) **Government-University-Industry-Research Roundtable. Annual report, June 14, 1991–June 14, 1992.** National Academy of Sciences, Washington, DC (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-89ER75498. Order Number DE95007121. Source: OSTI; NTIS; GPO Dep.

The major accomplishment of the past year in the Roundtable's continuing work on issues of concern to the academic enterprise is the preparation of two documents - Science and Technology in the Academic Enterprise: Status, Trends, and Issues and Perspectives on Financing Academic Research Facilities: A Resource for Policy Formulation. The significance of these two publications is that they both organize a large amount of complex and often controversial material in a way that is useful for further discussions and, in some cases, action by the government and higher education communities. The test for the Roundtable now is whether it can stimulate these follow-on activities. The model in this regard is the Federal Demonstration Project, where the Roundtable stimulated specific government-university joint actions in streamlining research grant administration. All of these activities are described below in greater detail.

10161 (DOE/FM–0002) **Stewards of a national resource.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). [1995]. 27p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005153. Source: OSTI; NTIS; INIS; GPO Dep.

Events of the past several years have had a profound impact on the mission of the Department of Energy. Most notably, the end of the Cold War has made it possible for us to reorient our mission from primarily the design, production, and testing of nuclear weapons toward: increasing efficiency and the choice of energy sources, supporting basic and applied research in science and technology, addressing environmental quality issues, improving industrial competitiveness, and a continued contribution to a secure national defense. These changes in direction will have a lasting effect on all of us. In all our efforts we have emphasized the need to earn trust and build partnerships. This booklet tells the story of a part of this change: new uses for our 50 major sites encompassing 2.4 million acres of land and billions of dollars worth of facilities. These new uses will reach beyond beating swords into plowshares and cleaning up our production facilities. They will include ecosystem protection, economic development, and industrial competitiveness. This is our future. None of this will be successful without the meaningful participation of our stakeholders: businesses and entrepreneurs, citizen groups, neighbors of our sites, government officials, and the American public as a whole. This booklet is to provide some insights into the new direction for our land and facilities.

10162 (ETDE-DE–15) **AGF program budget 1994.** Gockel, E. (comp.). Arbeitsgemeinschaft der Grossforschungseinrichtungen (AGF), Bonn (Germany). 1994. 93p. (In German). Order Number DE95746495. Source: OSTI; NTIS (US Sales Only).

The 16 German major research institutes are united in the AGF major research institutes working pool (Arbeitsgemeinschaft der Grossforschungseinrichtungen). AGF is a scientific organization which promotes the exchange of experiences and information among its members, takes part in the coordination of research and development projects, and represents common and major-research interests. The major research institutes are national research centers whose scientifico-technical and biomedical research and development activities require interdisciplinary cooperation and concentrated personnel employment, financial planning, and use of industrial equipment. The institutes make major contributions to the government-supported programs on energy research and technology, nuclear fundamental research, traffic and transport systems, aerospace and polar research, data processing and information technology, pollution abatement and health, biology and medicine, ocean techniques and geosciences. 10163 (INIS-mf–14445) **Proceedings of the second nuclear science and technology conference no. 2.** Office of Atomic Energy for Peace, Bangkok (Thailand). 1988. 440p. (In English, Thai). (CONF-8804346–: 2. Nuclear science and technology conference, Bangkok (Thailand), 19-22 Apr 1988). Order Number DE95619740. Source: OSTI; NTIS (US Sales Only); INIS.

This conference includes papers on a broad range of applications for nuclear technologies. Some of the topics covered are the electron beam and its applications, nuclear applications in industry, nuclear chemistry, radiobiology for the environment, and significant developments in nuclear medicine.

10164 (INIS-mf–15099) **R+D programme 'Environmental engineering'. R+D projects 1994. Data of September 1, 1994.** Bundesministerium fuer Forschung und Technologie, Bonn (Germany); Deutsche Forschungsanstalt fuer Luft- und Raumfahrt e.V. (DLR), Bonn (Germany). Projekttraegerschaften fuer Arbeit, Umwelt und Geshundheit. 1994. 489p. (In German). Order Number DE95753585. Source: OSTI; NTIS (US Sales Only); INIS.

Research programmes of the Federal Republic of Germany in the field of environmental engineering are presented. Research is

done in the fields of low-emission production processes, environmentally acceptable materials and products, and environmental analysis and measuring instruments. (SR)

10165 (KFK–5331) **Karlsruhe Nuclear Research Center, Institute of Hot Chemistry. Progress report on research and development work in 1993.** Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Heisse Chemie. Mar 1994. 27p. (In German). Order Number DE95746572. Source: OSTI; NTIS (US Sales Only); INIS.

The R and D project under review focuses on the development of methods for annihilation (total oxidation) of resistant chemical pollutants with emphasis on the annihilation of halogenated organic compounds. The basic application of chemical reactions to supercritical media, and to supercritical water in particular, is investigated. The present research activities cover investigations into the thermal treatment of highly contaminated solids through oxidation in supercritical fluids, extraction methods for decontamination of solids by means of supercritical fluids, and electrooxidation of organic pollutants by means of redox mediators. Methodical studies are made of the physico-chemical properties of supercritical systems, of supercritical reaction kinetics, phase formation and phase fluctuation, and reactive mass transfer. Models are developed for the respective reactions, mechanisms of formation and transfer processes. (orig.)

10166 (KFK–5344) **Karlsruhe Nuclear Research Center, Institute of Radiochemistry. Progress report on research and development work in 1993.** Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Radiochemie. Mar 1994. 32p. (In German). Order Number DE95746568. Source: OSTI; NTIS (US Sales Only); INIS.

The IRCH microsystems technology activities are dedicated to the development of chemical sensors and probes which meet the practical sensitivity, selectivity or specificity and stability requirements. The devices are miniaturized for integration into microsystems technology solutions and are designed for a wide range of process management, process control and process analysis uses including, e.g. pollution monitoring and medical diagnosis. The nuclear fusion project focuses on investigations into chemical and technical tritium technology problems which may occur, e.g. during tritium recovery from tritiated compounds in the internal and external fusion reactor fuel cycles. Additional efforts go into the physico-ceramic characterization of ceramic breeder materials, the extraction of bred tritium from the blanket, and the development of the necessary process analysis methods. (orig.)

10167 (NEI-DK–1844) **Aspects of research on environmental economy in Denmark, selected industrial countries and international organizations, 1992-94.** Arbejdsnotat, 7. Jensen, B. Rockwool Fondens Forskningsenhed, Copenhagen (Denmark). 1994. 94p. (In Danish). Order Number DE95744857. Source: OSTI; NTIS.

A description of research and literature on environmental economy, which also covers regulation in the form of taxation, quotas and subsidies related to activities which are pollutive, evaluations of environmental and natural advantages, and calculations of the costs and advantages of pollution control and abatement. Works that deal with evaluations of national budgeting related to the environment, relevant statistics and the economics of resources are also covered. The countries whose research and literature on these subjects and others ranging under the heading of environmental economy are selected for inclusion are Denmark, France, Norway, the Netherlands, the United Kingdom, Sweden, Germany, Canada, USA and Australia. Developments within Danish research and initiatives related to 'Det Strategiske Miljoeforskningsprogram' (The Strategic Research Programme) are surveyed in detail. The activities of international organizations within this field are elaborated and the contents of leading periodicals which deal with environmental economy are surveyed. (AB) (30 refs.)

10168 (NUTEK-R–94-49-B) **Energy Report. Summary and conclusions. The Energy Technology Fund.** Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). Dec 1994. 18p. Order Number DE95744967. Source: OSTI; NTIS.

An analysis is given, of the specific selected research and development activities financed from the Swedish Energy Technology Fund for the purpose of relating the effects of the measures to the energy policy targets. The areas that we have investigated are wood fuel and the cultivation of bio-energy, combustion and gasification including CHP, wind power, industrial processes and, finally, (vehicle) fleet trials with alternative fuels.

10169 (ORNL-TM–2887) **The case for National Environmental Laboratories.** Oak Ridge National Lab., TN (United States). Feb 1970. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95006363. Source: OSTI; NTIS; GPO Dep.

We suggest the establishment of several large generalized National Environmental Laboratories (NELs), each containing interacting groups of natural and social scientists, engineers, and information specialists. The field of action is the whole environment, both urban and rural, both present and future. By their organization and outlook, NELs would take a different cut across the fabric of environmental problems than has been possible hitherto. However, we must realize that NELs will not per se create instant Paradise; all we propose are instrumentalities designed to match the true scope of problems and perhaps stimulate a willing and charitable spirit. The tasks hitherto separately considered – the retrospective ones of restoring and preserving the environment and the prospective one of future technology assessment – are joined in NELS, because (1) environmental restoration and preservation involve prior and present technology decisions; assessment of future technology is the forward equivalent; (2) one of the activities tends to be conservationist, the other expansionist, and the two provide useful balance. We believe that these structures and roles are what is really required to implement both the recommendations of the National Academy of Sciences Panel on Technology Assessment, and the requirements implicit in the National Environmental Policy Act.

10170 (PNL–8641) **Final project report, staff exchange with Finnigan Corporation.** Edmonds, C.G. Pacific Northwest Lab., Richland, WA (United States). Aug 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95006864. Source: OSTI; NTIS; GPO Dep.

The objective of the exchange between Pacific Northwest Laboratory (PNL) and Finnigan Corporation is a transfer of expertise and technology for the design and operation of efficient and sensitive atmospheric pressure/vacuum electrospray ionization (ESI) sources. The development of such ion sources will permit wider application of mass spectrometry instrumentation in applied studies in a variety of disciplines including clinical, forensic, biochemical, biotechnical, and environmental studies where sensitivity is a paramount concern. Two meetings were held between representatives of Finnigan Corporation (led by Dr. Ian Jardine, Director for Marketing, Finnigan Corporation) and PNL staff members. During these meetings, Finnigan and PNL staff surveyed the existing technology for atmosphere/vacuum interface of mass spectrometry to ESI. The representatives from Finnigan viewed demonstrations of recent developments that increased efficiency and sensitivity for ESI mass spectrometry. During these meetings, knowledge and expertise were shared in the development of instrumentation, methods, and applications of ESI mass spectrometry with particular emphasis on current and planned Finnigan instrumentation. With the objective of more effective and competitive products for Finnigan Corporation, concepts for a Cooperative Research and Development Agreement (CRADA) were directed toward the development and commercialization of advanced high efficiency and sensitivity ESI technology. A detailed proposal and work plan for the cooperative project was developed and is included in this report.

10171 (PNL–9410-2) **The AMTEX Partnership™. Quarterly report.** Pacific Northwest Lab., Richland, WA (United States). Mar 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95005716. Source: OSTI; NTIS; GPO Dep.

The AMTEX Partnership is a collaborative research and development program among the U.S. Integrated Textile Industry, the Department of Energy, The DOE laboratories, other federal agencies and laboratories, and universities. The goal of AMTEX is to

strengthen the competitiveness of this vital U.S. industry and thereby preserve and create American jobs. The AMTEX Operating committee met on March 17, 1994 and approved the general direction and scope of the Industry R&D Road Map. All the Cooperative Research and Development Agreements (CRADAs) for the Demand Activated Manufacturing Project were completed and all nine labs were funded and underway by the end of March, 1994. Work was also initiated for three additional projects: Computer Aided Fabric Evaluation (CAFE), Textile Resource Conservation (TReC), and Sensors for Agile Manufacturing (SFAM). The plan for a Cotton Biotechnology project was completed and reviewed by the Industry Technical Advisory Committee. In addition, an 'impact study' on the topic of flexible fiber production was conducted by an industry group led by the fiber manufacturers.

10172 (PNL–9410-3) **The AMTEX Partnership™. Third quarter report.** Pacific Northwest Lab., Richland, WA (United States). Jun 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95005718. Source: OSTI; NTIS; GPO Dep.

The AMTEX Partnership is a collaborative research and development program among the U.S. Integrated Textile Industry, the Department of Energy, The DOE laboratories, other federal agencies and laboratories, and universities. The goal of AMTEX is to strengthen the competitiveness of this vital U.S. industry and thereby preserve and create American jobs. During the third quarter of 1994 all the Cooperative Research and Development Agreements (CRADAs) were completed and work initiated for three additional projects: Computer Aided Fabric Evaluation (CAFE), Textile Resource Conservation (TReC), and Sensors for Agile Manufacturing (SFAM). The plan for a Cotton Biotechnology project was completed and reviewed by the Industry Technical Advisory Committee. In addition, an 'impact study' on the topic of flexible fiber production was conducted by an industry group led by the fiber manufacturers.

10173 (PNL–10353) **Pacific Northwest Laboratory Institutional Plan FY 1995-2000.** Pacific Northwest Lab., Richland, WA (United States). Dec 1994. 174p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95007579. Source: OSTI; NTIS; GPO Dep.

This report serves as a document to describe the role PNL is positioned to take in the Department of Energy's plans for its national centers in the period 1995-2000. It highlights the strengths of the facilities and personnel present at the laboratory, touches on the accomplishments and projects they have contributed to, and the direction being taken to prepare for the demands to be placed on DOE facilities in the near and far term. It consists of sections titled: director's statement; laboratory mission and core competencies; laboratory strategic plan; laboratory initiatives; core business areas; critical success factors.

10174 (DOE/ER/75498–T3) **Government-University-Industry-Research Roundtable.** National Academy of Sciences, Washington, DC (United States). [1995]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-89ER75498. Order Number DE95007112. Source: OSTI; NTIS; GPO Dep.

Roundtable projects active during 1993 are described in this section. Projects completed in prior years are not included here, but publications resulting from them are included in the list of publications which are attached. Such prior projects include nurturing science and engineering talent, research facility financing, multidisciplinary research and education, university-industry-federal laboratory partnerships, and federal-state cooperation in science and technology.

10175 (EGG-M–94231) **A middle path for electricity options and sustainable development.** Mills, J.I.; Herring, J.S. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-940812–26: 29. intersociety energy conversion engineering conference, Monterey, CA (United States), 7-12 Aug 1994). Order Number DE95004994. Source: OSTI; NTIS; INIS; GPO Dep.

In a landmark article in Foreign Affairs in October 1976, Amory Lovins presented his vision of two vastly different and seemingly irreconcilable paths that energy provision might take into the future. One path was a "hard" path, characterized by extensive development of large, capital-intensive centralized electrical generating facilities and their peripherals, designed with little consideration given to the matching of these facilities to the requirements of the end-use needs. The second, "soft" path was characterized by energy technologies that are diverse, operate on renewable energy flows, are relatively simple, less capital-intensive, and matched in scale and energy quality to end-use needs. One of the most controversial arguments in the Lovins' paper was that the "hard" and "soft" paths are culturally and institutionally antagonistic. In retrospect, it seems this argument was self-fulfilling, for the history of the energy debate throughout the developed world since the appearance of the Lovins' article has been marked by an either-or antagonism that has left little room for serious discussion of a "middle-path." In this paper, we argue that "middle-path," paved with elements of both the soft and hard, is especially suited for developing countries, since they do not now carry the burden of an existing and extensive "hard path" energy infrastructure.

10176 (HW–74133) **Reactor and metallurgy R&D programs irradiation processing department FY-1963 - FY-1964.** Greager, O.H. Pacific Northwest Lab., Richland, WA (United States). 14 Sep 1962. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95006922. Source: OSTI; NTIS; GPO Dep.

This document describes the objectives, targets and scope of the development programs to be sponsored and conducted by the Irradiation Processing Department in support of the Hanford production reactors during FY-1963 - 1964. it is anticipated that the basic funding level for the IPD Reactor and Metallurgy R&D programs for the next two years will total $6,930,000 annually including overhead. Approximately 70 per cent of these funds will be directed in support of the N Reactor, and the remainder in support of the older reactors. The funding levels for the various reactor and Metallurgy programs requiring technical support are reflected in HW-72790, "Budget Proposals for O2 Program Research and Development, FY-1963 and FY-1964, Irradiation Processing Department", O. H. Greager, April 23, 1962. This latter document also contains Supplementary Budget Proposals to the Commission for work associated with the Plant Improvement Program for the older reactors and alternate production concedes for the N Reactor, which require funds in addition to the basic program. For current planning purposes, however, the technical efforts described within this Program Document have been restricted to those within the basic funding levels, and if Supplementary Programs are authorized, adjustments will be made accordingly.

10177 (INIS-BR–3455) **Psycho-social impact of the cesium-137 accident in the Brazilian society.** Chaves, E.G. Goias Univ., Goiania, GO (Brazil). 1993. 12p. (In Portuguese). Order Number DE95621988. Source: OSTI; NTIS (US Sales Only); INIS.

The author intends to question the assumed current public opinion that the psycho-social impact, resulting from the Goiania accident, is related with the ignorance of those who handled the caesium-137 source capsule, as well as the way media explained the accident. Some important aspects related to social behaviour during and after the accident are also shown. (B.C.A.).

10178 (INIS-BR–3470) **The nuclear contribution to the solution of Brazilian energy problem.** NUCLEN, Rio de Janeiro, RJ (Brazil). [1995]. 27p. (In Portuguese). Order Number DE95621980. Source: OSTI; NTIS (US Sales Only); INIS.

This report presents the justifying of Brazilian Nuclear Programme. Due to the demand increasing of electric energy in Brazil, the government decided to an alternative source. Although the Brazilian electric power program continue basically hydroelectric, nuclear power plants began to be constructed. The strategy adopted, the prospection of uranium enrichment, the project and

construction of nuclear power plants, the responsibilities of Nuclebras and Nuclen and several stages of this program are described. (C.M.).

10179 (INIS-mf–14471, pp. 7-23) **Nuclear power in Europe: status, safety, issues in a regulators trends.** Caro, R. (Consejo de Seguridad Nuclear, Madrid (Spain)). Israel Nuclear Society, Yavne (Israel); Israel Radiation Protection Association (Israel); Radiation Research Society of Israel (Israel); Israel Society of Medical Physics (Israel). Israel Nuclear Society, Yavne (Israel). Nov 1994. Sponsored by Technion Research and Development Foundation Ltd., Haifa (Israel);Israel Electricity Co., Tel Aviv (Israel);Israel Atomic Energy Commission, Tel Aviv (Israel);Ministry of Energy and Infrastructure, Jerusalem (Israel). (CONF-9411188–: 1994 joint meeting of the nuclear societies of Israel, Tel Aviv (Israel), 28-29 Nov 1994). In *Transactions of the nuclear societies of Israel Joint meeting 1994*. 234p. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

The structure and procedures of the European nuclear regulatory bodies, current and future programs and trends is presented. The subject covers a very wide horizon, where in addition to what is purely technological and scientific, two new historical-political facts are present: On the one side, the process of European unification, which began at the end of the Second World War and still has many problems to solve; on the other hand, the recent death and breaking apart of the USSR, the satellite countries' independence and the convulsions this transient has produced and will go on producing still for some time. It is probably convenient to contemplate all these inputs separately, i.e. to explicitly admit that the variables are separable. This is a procedure we follow so often in physics and mathematics in general and in reactor physics in particular. But this procedure is based upon a premise rigorously false, because the variables in the universe are not independent at all, and therefore not separable. In other words, the universe is not linear, but rather a complex of feed-back processes. However, restricting ourselves sufficiently, the Universe altogether is almost linear, and some processes in this space-time can be considered as independent.

10180 (NUREG–0540-Vol.16-No.12) **Title list of documents made publicly available, December 1-31, 1994.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Freedom of Information and Publications Services. Feb 1995. 315p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

The Title List of Documents Made Publicly Available is a monthly publication. It contains descriptions of the information received and generated by the US Nuclear Regulatory Commission (NRC). This information includes (1) docketed material associated with civilian nuclear power plants and other uses of radioactive materials and (2) nondocketed material received and generated by NRC pertinent to its role as a regulatory agency. As used here, docketed does not refer to Court dockets; it refers to the system by which NRC maintains its regulatory records. This series of documents is indexed by a Personal Author Index, a Corporate Source Index, and a Report Number Index.

10181 (USCEA–95006095) **U.S. Council for Energy Awareness 1992-1993.** US Council for Energy Awareness, Washington, DC (United States). [1995]. 31p. Sponsored by US Council for Energy Awareness, Washington, DC (United States). Order Number DE95006095. Source: OSTI; NTIS; U.S. Council for Energy Awareness, Suite 400, 1776 I Street, N.W., Washington, DC 20006-3708 (United States); GPO Dep.

This report of the US Council for Energy Awareness covers the following main topics. (1) Electricity and Economic growth: growth of these has been roughly parallel. New electric generating capacity will be needed if the US is to sustain economic growth. All resources - coal, oil, natural gas, renewables, energy efficiency, and nuclear energy - have a role to play. (2) Nuclear Energy and the Environment: Nuclear energy is one of the cleanest sources of electric power. (3) Nuclear Power and Energy Independence: Nuclear energy is partly responsible for the dramatic reduction in oil use by electric utilities over the past 20 years. (4) Nuclear Energy: Insurance for the future: As US utilities plan to meet the growing need for electric power, they face major uncertainties (increased competion; the extent that demand-side management and efficiency can reduce need; future price and supply of natural gas; impact of the 1990 Clean Air Act amendments; possibility of increased fossil fuel restrictions) Nuclear energy represents prudent, strategic planning against these uncertainties.

10182 (DOE/EIA–0202(95/1Q)) **Short-term energy outlook. Quarterly projections, first quarter 1995.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. Feb 1995. 42p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006880. Source: OSTI; NTIS; INIS; GPO Dep.

The Energy Information Administration (EIA) prepares quarterly, short-term energy supply, demand, and price projections for publication in February, May, August, and November in the Short-Term Energy Outlook (Outlook). The forecast period for this issue of the Outlook extends from the first quarter of 1995 through the fourth quarter of 1996. Values for the fourth quarter of 1994, however, are preliminary EIA estimates or are calculated from model simulations using the latest exogenous information available (for example, electricity sales and generation are simulated using actual weather data). The historical energy data, compiled into the first quarter 1995 version of the Short-Term Integrated Forecasting System (STIFS) database, are mostly EIA data regularly published in the Monthly Energy Review, Petroleum Supply Monthly, and other EIA publications. Minor discrepancies between the data in these publications and the historical data in this Outlook are due to independent rounding. The STIFS database is archived quarterly and is available from the National Technical Information Service. The cases are produced using the Short-Term Integrated Forecasting System (STIFS). The STIFS model is driven principally by three sets of assumptions or inputs: estimates of key macroeconomic variables, world oil price assumptions, and assumptions about the severity of weather. Macroeconomic estimates are produced by DRI/McGraw-Hill but are adjusted by EIA to reflect EIA assumptions about the world price of crude oil, energy product prices, and other assumptions which may affect the macroeconomic outlook. The EIA model is available on computer tape from the National Technical Information Service.

10183 (INIS-mf–15098) **Development of German energy consumption: A deterministic study of energy-relevant customer groups.** Wirtschaftswissenschaftliche Diskussionsbeitraege, v. V-135-94. Baumert, M. Oldenburg Univ. (Germany). Inst. fuer Volkswirtschaftslehre (VWL). Apr 1994. 70p. (In German). Order Number DE95752877. Source: OSTI; NTIS (US Sales Only); INIS.

A detailed study of the characteristic features of group-specific energy consumption was conducted (identification of the factors determining energy consumption of the productive sector, private households and private mobility demand). The question of who shall determine energy consumption in the future is analysed. This question is answered in a demand-specific study of consumption patterns and -effects. (orig./UA)

2930 Policy, Legislation, and Regulation

10184 (NEI-NO–483) **The challenge for the oil industry.** Myrvang, G. Norsk Petroleumsforening, Oslo (Norway). 1993. 9p. (CONF-9311288–1: ONS '93: Offshore Northern Seas. advanced projects conference, Stavanger (Norway), 23-24 Nov 1993). Order Number DE95755166. Source: OSTI; NTIS; INIS.

The conference paper deals with the Norwegian Government policy on the challenge for the oil industry. Three main topics are addressed. First, the author gives a short outline of the main characteristics of the present situation and derives the most important

challenges in coming years. Secondly, there are given some thoughts to how the industry may cope with this situation. Finally, the paper discusses the role of the authorities and how to stimulate continued exploration and development of fields on the Norwegian continental shelf.

10185 (WHC-SA–2723) **A model for determining when an analysis contains sufficient detail to provide adequate NEPA coverage for a proposed action.** Eccleston, C.H. Westinghouse Hanford Co., Richland, WA (United States). Nov 1994. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006767. Source: OSTI; NTIS; INIS; GPO Dep.

Neither the National Environmental Policy Act (NEPA) nor its subsequent regulations provide substantive guidance for determining the Level of detail, discussion, and analysis that is sufficient to adequately cover a proposed action. Yet, decisionmakers are routinely confronted with the problem of making such determinations. Experience has shown that no two decisionmakers are Likely to completely agree on the amount of discussion that is sufficient to adequately cover a proposed action. one decisionmaker may determine that a certain Level of analysis is adequate, while another may conclude the exact opposite. Achieving a consensus within the agency and among the public can be problematic. Lacking definitive guidance, decisionmakers and critics alike may point to a universe of potential factors as the basis for defending their claim that an action is or is not adequately covered. Experience indicates that assertions are often based on ambiguous opinions that can be neither proved nor disproved. Lack of definitive guidance slows the decisionmaking process and can result in project delays. Furthermore, it can also Lead to inconsistencies in decisionmaking, inappropriate Levels of NEPA documentation, and increased risk of a project being challenged for inadequate coverage. A more systematic and less subjective approach for making such determinations is obviously needed. A paradigm for reducing the degree of subjectivity inherent in such decisions is presented in the following paper. The model is specifically designed to expedite the decisionmaking process by providing a systematic approach for making these determination. In many cases, agencies may find that using this model can reduce the analysis and size of NEPA documents.

10186 (ETDE-DE–16) **Gas exchanges in the United States - a model for Europe?.** Wirtschaftswissenschaftliche Diskussionsbeitraege, v. V-131-94. Hensing, I. Oldenburg Univ. (Germany). Inst. fuer Volkswirtschaftslehre (VWL). 1994. 33p. (In German). Order Number DE95746581. Source: OSTI; NTIS (US Sales Only).

Revised version of a lecture presented within the GEE meeting on 'Price formation in oil and gas markets - questions and answer from politics, market, and environment' on 27 January 1994 in Bad Zwischenhahn, Lower Saxony (DE).

When on 31 May 1991 the European Union - at the time still under the name of EC - specified its plans for restructuring competition in the European gas markets by issuing a Directive on the Transit of Natural Gas Via Large Networks it met with vehement opposition from the gas industry, especially in Germany. These plans have ever since been a focal topic of intense scientific and politics-economic discussions. Some of the changes demanded by the EU have already become practice in the US gas trade, where they lend themselves to an assessment for their transferability to the situation in Europe. The following paper deals with the specifics of natural gas and the question whether the US can serve as a model for Euorpe. Regarding its mode of operation and significance, the New York Mercantile Exchange (NYMEX) forms the hub of American gas price formation. (orig./UA)

10187 (ETDE-DE–23) **Ruhrgas forum. Edition 4. 1992. Reports from science and technology.** Ruhrgas AG, Essen (Germany). Dec 1992. 45p. (In German). Order Number DE95745742. Source: OSTI; NTIS (US Sales Only).

A number of technical reports and short communications outline the wide range of activities of Ruhrgas AG in the fields of research and development. Activities range from advanced solutions to everyday problems of gas supply up to futuristic technologies. (UA)

10188 (DOE/EIA–0437(93)/2) **Financial statistics of major US publicly owned electric utilities 1993.** USDOE Energy Information Administration, Washington, DC (United States). Office of Coal, Nuclear, Electric and Alternate Fuels. Feb 1995. 543p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006765. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

The 1993 edition of the Financial Statistics of Major U.S. Publicly Owned Electric Utilities publication presents five years (1989 to 1993) of summary financial data and current year detailed financial data on the major publicly owned electric utilities. The objective of the publication is to provide Federal and State governments, industry, and the general public with current and historical data that can be used for policymaking and decision making purposes related to publicly owned electric utility issues. Generator and nongenerator summaries are presented in this publication. The primary source of publicly owned financial data is the Form EIA-412, the Annual Report of Public Electric Utilities, filed on a fiscal basis.

10189 (DOE/FE/62490–T1) **Incremental cost pricing of transmission services. Final report.** ICF Resources, Inc., Fairfax, VA (United States). Dec 1994. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-93FE62490. Order Number DE95005777. Source: OSTI; NTIS; GPO Dep.

This report, prepared by ICF Resources, under a sub-contract with IT Corporation, is concerned chiefly with examining the economic concepts underlying an Incremental Cost Pricing Framework (ICPF), which is defined here as a pricing regime that takes into account several factors: economic efficiency in terms of sending the correct long-term price signals to both users and owners of transmission assets; pricing of individual services in relationship to cost causation; full recovery of costs associated with transmission service; and applicability to real-world power systems without extraordinary administrative burdens. In the course of this examination, the report makes assumptions, as necessary, and assesses the extent to which they may or may not comport with real-world conditions. It also assesses the pros and cons of different approaches to pricing various components of transmission service without making a recommendation as to the superiority of one approach over another from a public policy perspective.

10190 (ETDE-DE–24) **Electricity supply in the market economy. Statements by the German power economy on the second report of the deregularisation commission issued in March 1991. Chapter 4 'The electricity economy'.** Stromdiskussion. Kukuck, H.A. (ed.). Informationszentrale der Elektrizitaetswirtschaft e.V. (IZE), Frankfurt am Main (Germany). [1994]. 127p. (In German). Order Number DE95752826. Source: OSTI; NTIS (US Sales Only).

The "Independent Experts' Commission for Cutting Back Market Inhibiting Regularisation" appointed by the Federal Government on 16 December 1987 has elaborated two comprehensive exports which were presented in March 1990 and March 191 respectively. Free to choose its own topics, the deregulariation commission largely dedicated its work to the question where in our economic system it could make out superflows state intervention obstructing free competition in a market. The commission's second report contained an expert opinion on the power economy. The public power supply companies believe that the analysis contained in this opinion and the conclusions drawn from it require a detailed review. They are of an opinion that the these of the deregularisation commission should not remain unchallenged. This issue of Stromdiskussion gives an authorised short version of the experts' deliberations followed by a documentation of the statements by various associations. (orig./UA)

10191 (ETDE-DE–26) **The data envelopment analysis efficiency of public power suppliers. A contribution to the discussion of deregulation.** Volkswirtschaftliche Diskussionsreihe, v. 114. Cantner, U.; Hanusch, H.; Westermann, G. Augsburg Univ.

(Germany). Inst. fuer Volkswirtschaftslehre. Mar 1994. 29p. (In German). Order Number DE95752273. Source: OSTI; NTIS (US Sales Only).

The emphasis of a draft on the reform of energy legislation from the Federal Ministry of Economics and the emphasis of the general discussion is the so-called third party access and unbundling as well as the new approach to the granting of regional monopolies. In the final analysis the point of all these suggestions is to unbundle supplies and make sure that more competition creates more efficiency. This contribution looks at the empirical aspects of the problem. Some public power supply companies in Germany were selected in order to identify and describe inefficiencies of public power supply in Germany. Part two briefly describes the situation on the sector of "public power supply" which the emphasis on the commitment of the public. Part three describes the basics of data envelopment analysis which is then used in part 4 in order to analyse power suppliers. A distinction is made between private and public industry analysis. Part 5 contains some conclusions. (orig./UA)

This is a brief description of energy source developments, information/dates on work-shops, lighting systems, and related software.

10193 (NUTEK-R–94-49-A) **Energy Report. Summary and Conclusions. The Swedish energy system in 2005.** Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). Dec 1994. 15p. Order Number DE95744966. Source: OSTI; NTIS.

Forecasts for the Swedish energy system up to 2005 are presented in this report. The electricity market is presently undergoing deregulation, and a significant proportion of this report is therefore devoted to an analysis of the electricity market today and in the future. An especially important uncertainty factor is when the phase-out of nuclear power will start and at what rate it will proceed. In this matter, there is no political decision to take into account except that nuclear power will be phased out by 2010. The uncertainty in the assessment of nuclear capacity by 2005 is therefore great. 2 tabs

10194 (PNL–10383) **The specification and estimation of technological change in electricity production.** Kavanaugh, D.C.; Ashton, W.B. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95007564. Source: OSTI; NTIS; GPO Dep.

This study focuses on the rate of technological change in electricity production. The dominant role of fossil fuel-fired electricity production in the industry, coupled with the direct association with the emission of greenhouse gases, makes technology parameters particularly significant for several reasons. First, very long-run simulations of energy-economic paths at a global level require that technical progress occupy a place in the methodology for sound formulations that are vital in global emissions/energy policy analysis. Second, given the outlook for electricity generation being predominately coal-based, especially in developing economies around the world, the specification and measurement of technical change is essential for developing realistic long-run technology forecasts. Finally, industry or sector growth in productivity hinges partly on technical progress, and updated analysis will always be necessary to stay abreast of developments on this front, as well as for economic growth considerations in general. This study is based on empirical economic research on production functions in the electric utility industry. However, it advances a seldom used approach, called the "engineering-production function", in contrast to the more common neoclassical approach used by economists. Combined with this approach is a major departure from the type of data used to conduct econometric estimations of production parameters. This research draws upon a consistent set of ex ante or "blueprint" data that better reflects planned, technical performance and cost data elements, in contrast to the more customary, expect type of data from actual firm/plant operations. The results from the examination of coal-fired technologies indicate the presence of technical change. Using data for the period from 1979 to 1989, we find technical change to be capital-augmenting at the rate of 1.8 percent per year.

10195 (PNL-SA–24064) **Regulatory and policy implications of Federal legislation on utility DSM programs.** Hopkins, M.E.F. (Pacific Northwest Lab., Richland, WA (United States)); Griffiths, D. Pacific Northwest Lab., Richland, WA (United States). Mar 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9403196–1: Affordable comfort conference, Philadelphia, PA (United States), 20-25 Mar 1994). Order Number DE95004897. Source: OSTI; NTIS; GPO Dep.

This paper reviews some potential consequences of recent Federal legislation to demand-side management (DSM) at utilities. The legislation discussed are the 1992 Energy Policy Act (EPAct), the 1990 Amendments to the Clean Air Act, and FERC Order No. 636. Examples of specific activities regarding DSM in Pennsylvania are included for illustration. Each of the Federal laws under discussion is unique in terms of origin, goals, and focus. Nevertheless, they all focus on the regulated energy industries such that their effects tend to combine to force massive changes. In die regulated electric and natural gas industries, this synergy is compounding the complexity of management and, at least in the short term, contributing to increases in the cost of doing business. In the long term, these Federal initiatives are likely to lead to a massive reassessment of state-regulated energy sources in production and end use, and their environmental consequences. The overall effect of all three pieces of legislation is to increase competition among the state-regulated utilities. The differences between competitive and regulated industries are noted in a effort to explain the effect of inducing competition among energy utilities. This has particular relevance to utility-sponsored energy-efficiency programs such as DSM and other customer assistance activities. This paper has three objectives. First, it outlines the contents of the Federal legislation regarding utility DSM programs. Second, it explains some of the impacts of these laws and regulations on utility programs, particularly the likely effects of the emerging competitive utility market. Third, it seeks to understand where and how action will be needed to carry out many of the provisions of these laws in the most cost-effective manner.

10196 (DOE/EIA–0538(94/95-18)) **Winter fuels report. Week ending: February 10, 1995.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 16 Feb 1995. 76p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95007154. Source: OSTI; NTIS; GPO Dep.

The Winter Fuels Report is intended to provide concise, timely information to the industry, the press, policymakers, consumers, analysts, and State and local governments on the following topics: distillate fuel oil net production, imports and stocks on a US level and for all Petroleum Administration for Defense Districts (PADD) and product supplied on a US level; propane net production, imports and stocks on a US level and for PADD's 1, 2, and 3; natural gas supply and disposition and underground storage for the US and consumption for all PADD's, as well as selected National average prices; residential and wholesale pricing data for heating oil and propane for those States participating in the joint Energy Information Administration (EIA)/State Heat Oil and Propane Program; crude oil and petroleum price comparisons for the US and selected cities; and a 6–10 Day and 30-Day outlook for temperature and precipitation and US total heating degree-days by city. The distillate fuel oil and propane supply date are collected and published weekly. The data are based on company submissions for the week ending 7:00 a.m. for the preceding Friday. 36 figs., 13 tabs.

10197 (UCID–19227-93) **U.S. energy flow - 1993.** Borg, I.Y.; Briggs, C.K. Lawrence Livermore National Lab., CA (United States). Oct 1994. 22p. Sponsored by USDOE, Washington, DC

(United States). DOE Contract W-7405-ENG-48. Order Number DE95007945. Source: OSTI; NTIS; GPO Dep.

With continued improvement in the economic health of the nation, energy consumption in 1993 increased by almost 2.5%. Use of energy in all major end-use sectors increased, with the largest gains registered in the residential/commercial sector. In this sector, substantial increase in the use of natural gas reflected a harsh 1993-1994 winter as well as broader availability of the fuel for space heating. Crude oil imports rose 8% but stood below the all-time high set in 1977. About half of the increase reflected declining domestic oil production. Imports of natural gas, principally from Canada, increased as they have every year since 1986. They comprise 11% of supply and supplement domestic production, which has similarly risen over the same time span. Increased demand for natural gas is evident in most sectors but especially in the industrial sector, where a growing number of cogenerators of electricity burn natural gas. Although coal consumption in the United States rose 3% in 1993, domestic coal production declined by a greater margin due to a coal strike. Because of increased international competition, exports fell 27%. Electricity transmitted by the utilities again increased, following a decade-long trend interrupted only in 1992 by the national economic recession. The provisions of the Energy Policy Act of 1992 dealing with transport of nonutility-generated electricity by the public utilities began to be implemented in 1993. The provisions of the Energy Policy Act as well as those of the Public Utility Regulatory Policies Act of 1978 are setting the stage for increased competition for customers and for what promises to be a restructuring of the historically monopolistic industry. Nuclear power from the United States's 109 operable reactors constituted 21% of utility-generated electricity. With the continued retirement of outmoded and flawed reactors, nuclear capacity factors attained 71 in 1993, up from 56% a decade earlier.

10198 (UCRL-ID–18991-92) **California energy flow in 1992.** Borg, I.Y.; Briggs, C.K. Lawrence Livermore National Lab., CA (United States). 1 Apr 1994. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95004197. Source: OSTI; NTIS; GPO Dep.

For the past 16 years energy flow diagrams for the State of California have been prepared from available data by members of the Lawrence Livermore National Laboratory. They have proven to be useful tools in graphically expressing energy supply and use in the State as well as illustrating the difference between particular years and between the State and the US as a whole. As far as is possible, similar data sources have been used to prepare the diagrams from year to year and identical assumptions[1a–1e] concerning conversion efficiencies have been made in order to minimize inconsistencies in the data and analyses. Sources of data used in this report are given in Appendix B and C; unavoidably the sources used over the 1976–1993 period have varied as some data bases are no longer available. In addition, we continue to see differences in specific data reported by different agencies for a given year. In particular, reported data on supply and usage in industrial/commercial/residential end-use categories have shown variability amongst the data gathering agencies, which bars detailed comparisons from year to year. Nonetheless, taken overall, valid generalizations can be made concerning gross trends and changes.

10199 (Version 1.0) **The NEEDISk: A first entry to sectoral energy consumption data.** Nov 1994. Source: Available from NEEDIS, Postbus 1, 1755 ZG Petten (Netherlands).

Description: IBM or 100% compatible computer, 640KB; DOS version 3.1 or higher.

The purpose of NEEDIS is to compile and maintain a consistent framework in the field of energy consumption and energy conservation. Within that framework univocal, relevant terms and indicators must be used to guarantee optimal accessibility of data. The data can not only be used to support energy conservation policy, but also to support the initiation and testing of activities in the above-mentioned fields. The title system is developed and maintained by ECN Policy Studies. This diskette contains a selection of energy data from the database NEEDIS. The data originate from longitudinal studies, mainly carried out by the Dutch Central Bureau of Statistics (CBS) and studies, carried out under the authority of the Association of Energy Distribution Companies EnergieNed. Next to consulting the data via the computer screen, the diskette offers the possibility to print annual data series or to transfer data to a spreadsheet or other database.

Laereanstalternes Faelles Miljoekursus, Copenhagen (Denmark). Apr 1994. 88p. (In Danish). Order Number DE95755096. Source: OSTI; NTIS.

The aim was to evaluate the potential of using organic wastes from households in Copenhagen for the production of methane in this city. It is discussed to what extent the collection of organic wastes from households and the following processing in biomass conversion plants can be considered as a sustainable method of getting rid of this type of waste in Copenhagen. It is also debated which interests will be accounted for in connection with the collection and processing of organic household wastes in this area. (AB) (31 refs.)

30 DIRECT ENERGY CONVERSION

3001 MHD Generators

Refer also to citation(s) 10772

10201 (CONF-9406163–2) **Development of laser optogalvanic spectroscopy as a probe of alkali atoms in an MHD environment.** Monts, D.L.; Qian, S.; Cook, R.L.; Shepard, W.S. Mississippi State Univ., MS (United States). Diagnostic Instrumentation and Analysis Lab. [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-80ET15601. From 32. symposium on engineering aspects of magnetohydrodynamics (SEAM-32); Pittsburgh, PA (United States); 27-30 Jun 1994. Order Number DE95006481. Source: OSTI; NTIS; GPO Dep.

Application of Laser Optogalvanic Spectroscopy (LOGS) to MHD combustion systems requires selection of an appropriate alkali atom electronic transition to monitor. These studies suggest that in MHD combustion systems, it is desirable to use cesium, which occurs as an impurity in potassium compounds, as a surrogate for potassium rather than to directly monitor potassium in order to obtain reliable determinations of seed concentration. Studies were also performed to investigate the effect of electrode corrosion on the normalized LOGS signal intensity at a fixed wavelength (578.238 nm). During six-hour experiments in a near-stoichiometric flame, the normalized LOGS signal intensity decreased by 40-50% for a -960 V rod electrode and by 10-20% for a -500 V rod electrode. These changes are attributed to buildup of an oxide coating on the electrode, reducing the collection efficiency of the electrode.

10202 (CONF-9406163–3) **Non-coincident multi-wavelength emission absorption spectroscopy.** Baumann, L.E. Mississippi State Univ., MS (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-80ET15601. From 32. symposium on engineering aspects of magnetohydrodynamics (SEAM-32); Pittsburgh, PA (United States); 27-30 Jun 1994. Order Number DE95006480. Source: OSTI; NTIS; GPO Dep.

An analysis is presented of the effect of noncoincident sampling on the measurement of atomic number density and temperature by multiwavelength emission absorption. The assumption is made that the two signals, emission and transmitted lamp, are time resolved but not coincident. The analysis demonstrates the validity of averages of such measurements despite fluctuations in temperature and optical depth. At potassium-seeded MHD conditions, the fluctuations introduce additional uncertainty into measurements of potassium atom number density and temperature but do not significantly bias the average results. Experimental measurements in the

CFFF aerodynamic duct with coincident and noncoincident sampling support the analysis.

3003 Thermoelectric Generators

10203 (KU-HCOE-NBI-R–1994-08) **New bounds on the performance parameters of a thermoelectric generator.** Jincan Chen; Andresen, B. No corporate text available. 1994. 24p. Contract CHRX-CT92.0007. Order Number DE95755107. Source: OSTI; NTIS.

The influence of three main irreversibilities existing in thermoelectric devices on the performance of a thermoelectric generator is investigated by means of non-equilibrium thermodynamics and finite-time thermodynamics. It is first proven that the Joule heat generation inside the thermoelectric device will flow equally to the hot and the cold junctions of the device for any values of the thermal conductances between the thermoelectric device and its external heat reservoirs. Then the efficiency and the power output of the thermoelectric generator are optimized. The maximum efficiency and the maximum power output are determined. The power output versus efficiency curves illustrate clearly that the two operating point corresponding to maximum efficiency and maximum power output approach one another as the thermal conductances between the thermoelectric device and its external heat reservoirs decrease. Finally, the optimal problem relative to the load matching involved in the design of a practical thermoelectric generator is discussed in detail. (au) (13 refs.)

3005 Fuel Cells

10204 (CONF-901106–) **1990 fuel cell seminar: Program and abstracts.** Fuel Cell Seminar Organizing Committee (United States). 1990. 534p. Sponsored by USDOE, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States);Gas Research Inst., Chicago, IL (United States);National Aeronautics and Space Administration, Washington, DC (United States);Commission of the From 1990 fuel cell seminar; Phoenix, AZ (United States); 25-28 Nov 1990. Order Number DE92791097. Source: OSTI; NTIS; Courtesy Associates, Inc, 655 15th St., NW, Suite 300, Washington, DC 20005 (United States); GPO Dep.

This volume contains author prepared short resumes of the presentations at the 1990 Fuel Cell Seminar held November 25-28, 1990 in Phoenix, Arizona. Contained herein are 134 short descriptions organized into topic areas entitled An Environmental Overview, Transportation Applications, Technology Advancements for Molten Carbonate Fuel Cells, Technology Advancements for Solid Fuel Cells, Component Technologies and Systems Analysis, Stationary Power Applications, Marine and Space Applications, Technology Advancements for Acid Type Fuel Cells, and Technology Advancement for Solid Oxide Fuel Cells.

10205 (DOE/MC/29237–3983) **Molten Carbonate Fuel Cell (MCFC) Product Development Test. Second annual report.** Fuel Cell Engineering Corp., Danbury, CT (United States). 15 Dec 1994. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC29237. Order Number DE95007345. Source: OSTI; NTIS; GPO Dep.

This is the second annual report covering progress made under DOE cooperative agreement DE-FC21-92MC29237, Molten Carbonate Fuel Cell Product Development Test. The project is for the design, construction, and testing of a 2MW carbonate fuel cell power plant in the City of Santa Clara, California. The report is divided into sections which describe the progress in various program activities, and provides an overview of the program, including the project objectives, site location, and schedule.

10206 (DOE/METC–95/7168) **Intermediate-sized natural gas fueled carbonate fuel cell power plants.** Sudhoff, F.A. (USDOE Morgantown Energy Technology Center, WV (United States)); Steinfeld, G. USDOE Morgantown Energy Technology Center, WV (United States). 30 Apr 1993. 4p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95004991. Source: OSTI; NTIS; GPO Dep.

This executive summary of the report, describes the accomplishments of the joint Morgantown Energy Technology Center and Energy Research Corporation Cooperative Research and Development Agreement (CRADA) No. 92-003. Intermediate-sized natural gas fueled carbonate fuel cell power plants with steam-bottoming cycles have been evaluated by DOE/METC and ERC. This was accomplished by mutual development of a design basis and subsequent development of computer simulation models, which characterize the performance of a 50 MW baseline plant configuration, as well as a more advanced plant configuration.

10207 (DOE/METC–95/7169) **Intermediate-sized natural gas fueled carbonate fuel cell power plants.** Sudhoff, F.A. (USDOE Morgantown Energy Technology Center, WV (United States)); Fleming, D.K. USDOE Morgantown Energy Technology Center, WV (United States). 1 Apr 1994. 4p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95004990. Source: OSTI; NTIS; GPO Dep.

This executive summary of the report describes the accomplishments of the joint US Department of Energy's (DOE) Morgantown Energy Technology Center (METC) and M-C POWER Corporation's Cooperative Research and Development Agreement (CRADA) No. 93-013. This study addresses the intermediate power plant size between 2 megawatt (MW) and 200 MW. A 25 MW natural-gas, fueled-carbonate fuel cell power plant was chosen for this purpose. In keeping with recent designs, the fuel cell will operate under approximately three atmospheres of pressure. An expander/alternator is utilized to expand exhaust gas to atmospheric conditions and generate additional power. A steam-bottoming cycle is not included in this study because it is not believed to be cost effective for this system size. This study also addresses the simplicity and accuracy of a spreadsheet-based simulation with that of a full Advanced System for Process Engineering (ASPEN) simulation. The personal computer can fully utilize the simple spreadsheet model simulation. This model can be made available to all users and is particularly advantageous to the small business user.

10208 (DOE/PC/93219–T4) **Novel carbon-ion fuel cells. Third quarter 1994 technical progress report.** Cocks, F.H.; LaViers, H. Duke Univ., Durham, NC (United States). Dept. of Mechanical Engineering and Materials Science. 29 Sep 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93219. Order Number DE95007660. Source: OSTI; NTIS; GPO Dep.

The research project is proceeding with the construction of apparatus to create a solid electrolyte in the form of highly pressed and sintered pellets of CeC_2 and LaC_2 and to test the pellets for the ionic conduction of carbon-ions across the electrolyte, and the attendant, but undesirable, parasitic conduction of electrons across the electrolyte. Laboratory work in this quarter has been in the two areas of quantifying the alpha to beta phase transformation temperatures of cerium carbide. Attempts to determine this temperature of transition have continued on a Seiko 5200C Differential Thermal Analyzer, with an emphasis on moisture free inert gas atmospheres. The use of Carbon-13 or Carbon-14 tracers is being evaluated as a method of measuring the mobility of carbon-ions in the lanthanide carbide electrolytes with the fluorite crystal structure. These tracers could be deposited on the lanthanide carbide pellets by several common methods, such as sputter coating from a lanthanide carbide target or arc evaporation of a rod or pellet of pure carbon-13 or carbon-14 onto the lanthanide carbide pellet. With the arrival of 25 grams of carbon-13 powder in 100 mesh size, a preliminary investigation of arc evaporation as been started using a Pelco Sputter Coater Model 3 with a Model 9100 Carbon Evaporation Attachment.

EFP-91.

A suitable metallic alloy to substitute for the presently employed ceramic $LaCrO_3$-based interconnect material is looked for. Purpose of interconnect in a fuel cell stack is to separate the fuel gas (hydrogen or natural gas) from the air gas that flows on either side of the fuel cell while at the same time conducting electrons from one cell to another. Such a metal must have a thermal expansion coefficient close to that of other cell components in order to reduce the residual stresses imposed on them when cooling from the stack assembling temperature to the ambient; it must have very good corrosion resistance, especially against oxidation and carburization, and the interactions with the electrode materials must not be detrimental to cell properties. Amongst a number of high-temperature alloys a Cr-rich alloy oxide-dispersion-strengthened by fine Y_2O_3 particles shows the best properties and are now being tested in more detail. Besides the strengthening effect, Y_2O_3 also greatly improves oxidation resistance. The thermal expansion coefficient of the Cr-rich alloys is slightly larger than that of the more critical cell component, namely the yttria-stabilized zirconia electrolyte, which will be beneficial as this ceramic then will be in a state of compression after the stack assemblance. The alloy forms Cr-oxide as a protecting scale. Main problems in connection with the use of such a alloy are that although chromia is a reasonable electronic conductor the scale thickness can not be allowed to exceed more than a few micrometers, and that the evaporation rate of Cr-oxide is rather high at elevated temperatures which can destroy the electrocatalytic properties of especially the cathode. Activities are now focused on lowering the stack assembling and operation temperatures as well as performing controlled surface modifications such that the resulting surface oxide has a low evaporation rate and low electrical resistance. 10211 (CONF-950104–4) **Simulation and performance analysis of an ammonia-water absorption heat pump based on the generator-absorber heat exchange (GAX) cycle.** Grossman, G. (Israel Institute of Technology, Haifa (Israel)); DeVault, R.C.; Creswick, F.A. Oak Ridge National Lab., TN (United States). [1995]. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From American Society of Heating, Refrigerating and Air-Conditioning Engineers winter meeting and exhibition; Chicago, IL (United States); 28 Jan - 1 feb 1995. Order Number DE95006740. Source: OSTI; NTIS; GPO Dep.

A computer simulation has been conducted to investigate the performance of an absorption heat pump, based on the Generator-Absorber Heat Exchange (GAX) cycle employing ammonia-water as the working fluid pair. The particular feature of this cycle is the ability to recover heat from the absorber and employ it to partially heat the generator, thus improving the COP. In the present study, a detailed simulation has been conducted of one of the preferred configurations for the cycle. A modular computer code for flexible simulation of absorption systems (ABSIM) was employed. Performance parameters, including COP and capacity, were investigated as functions of different operating parameters over a wide range of conditions in both the cooling and heating mode. The effect of the ambient temperature, the rectifier performance, the flowrate in the GAX heat transfer loop and the refrigerant flow control were investigated. COP's on the order of 1.0 for cooling and 2.0 for heating have been calculated.

10212 (CONF-950104–5) **Simulation and performance analysis of a 4-effect lithium bromide-water absorption chiller.** Grossman, G. (Technion-Israel Institute of Technology, Haifa (Israel)); Zaltash, A.; DeVault, R.C. Oak Ridge National Lab., TN (United States). [1995]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From American Society of Heating, Refrigerating and Air-Conditioning Engineers winter meeting and exhibition; Chicago, IL (United States); 28 Jan - 1 feb 1995. Order Number DE95007043. Source: OSTI; NTIS; GPO Dep.

Performance simulation has been conducted for a 4-effect lithium bromide-water chiller, capable of substantial performance improvement over state-of-the-art double-effect cycles. The system investigated includes four condensers and four desorbers coupled together, forming an extension of the conventional double-effect cycle; based on prior analytical studies, a parallel flow system was preferred over series flow, and double-condenser coupling was employed, to further improve performance. A modular computer code for simulation of absorption systems (ABSIM) was used to investigate the performances of the cycle. The simulation was carried out to investigate the influence of some major design parameters. A coefficient of performance around 2.0 (cooling) was calculated at the design point, with a heat supply temperature of 600°F (315°C) at the solution outlet from the high temperature desorber. With some optimization of the weak (pumped) solution flowrate and of the solution split among the four desorbers, this COP may be raised above 2.2.

10213 (DOE/BP–2265) **Structural foam-core panels in Northwest HUD-code manufactured housing: A preliminary assessment of opportunities and obstacles.** Durfee, D.L.; Lee, A.D.; Onisko, S.A. Pacific Northwest Lab., Richland, WA (United States). Jul 1993. 68p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95006865. Source: OSTI; NTIS; GPO Dep.

This investigation of structural foam-core panels (foam panels) in manufactured housing was initiated during the Super Good Cents (SGC) program. The SGC program limited allowable glazing area because of the relatively high thermal losses associated with most windows. Due to their superior thermal performance, foam panels appeared to be a viable option to allow increased glazing area without compromising the thermal integrity of the wall. With the inception of the Manufactured-Housing Acquisition Program (MAP), however, the focus of this study has shifted. MAP permits unlimited glazing area if expensive, super-efficient, vinyl-framed, argon-gas-filled, low-emissivity coated windows are installed. Although MAP permits unlimited glazing area, a foam panel wall could allow the use of less expensive windows, larger window area, or less insulation and still provide the required thermal performance for the building. Bonneville contracted with the Pacific Northwest Laboratory (PNL) to investigate the feasibility of using foam panels in HUD-code manufactured housing. This study presents the results from a product and literature search. The potential barriers and benefits to the use of foam panels are determined from a regional survey of the HUD-code manufacturers and foam panel producers.

10214 (DOE/CE/23810–42G) **Methods development for measuring and classifying flammability/combustibility of refrigerants. Interim report, Task 1 – Annotated bibliography and summary.** Heinonen, E.W. (New Mexico Univ., Albuquerque, NM (United States). Center for Global Enviromental Technology); Tapscott, R.E. New Mexico Univ., Albuquerque, NM (United States). Center for Global Enviromental Technology; Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States). Jun 1994. 118p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. (NMERI-OC–94/31). Order Number DE95007232. Source: OSTI; NTIS; GPO Dep.

For Task 1 of the flammable refrigerant methods development contract, NMERI performed a literature search to identify references on the flammability of refrigerants. A database to store a bibliographic record of the literature search was then developed. This database is contained in the Microsoft Access® relational database management system for Windows™. Searches for applicable sources were made on-line using the STN® scientific and technical network; off-line using the National Technical Information Service (NTIS) database; WorldCat CD-rom database; the University of New Mexico library search; the Air-Conditioning and

Refrigeration institute (ARI) Refrigerant Database; and personal contacts. Three specific areas were searched: refrigerant properties, flammability test methods, and ignition technology. Many of the articles retrieved fall into multiple categories. Ignition technology was included as a separate category because of the importance of the ignition process to flammability and the vast amount of information available on ignition of gaseous fuels, especially hydrocarbons. Over 90 separate references have been entered into the database. Two separate report formats have been developed to display the results of the literature search. Appendix B is the short report format–without abstract, while Appendix C is the long format–with abstract.

10215 (ETDE-DE–25) **Energy conservation in public buildings. Subjects.** Beitraege zur regionalen Entwicklung, v. 35. Sahling, U. (comp.) (ARENHA GmbH, Hannover (Germany)); Schulze, L. (comp.). Kommunalverband Grossraum Hannover (Germany). Oct 1993. 105p. (In German). Order Number DE95755761. Source: OSTI; NTIS (US Sales Only).

Within the framework of regional planning activities Kommunalverband Grossraum Hannover, the association of communities in the Greater Hanover area, has been dealing increasingly with energy- and environmental-policy issues since the early eighties. This brochure contains eleven papers which discuss questions put by end users and possibilities of reducing energy consumption in public buildings. Emphasis is placed on heating systems retrofitting, improved thermal insulation, and on solar energy utilization. Separate records are available for all papers. (DV)

10216 (ETDE-DE–25, pp. 1-5) **On energy conservation in public buildings in Greater Hannover. An introduction.** Sahling, U. Kommunalverband Grossraum Hannover (Germany). Oct 1993. 105p. (In German). In *Energy conservation in public buildings. Subjects.* Order Number DE95755761. Source: OSTI; NTIS (US Sales Only).

Short communication PUBLIC BUILDINGS/energy conservation; PUBLIC BUILDINGS/planning; PLANNING; ENERGY POLICY; ENERGY CONSUMPTION; MEASURING METHODS; AIR POLLUTION ABATEMENT; CARBON DIOXIDE; SPACE HEATING; ELECTRIC POWER; SCHOOL BUILDINGS; HOSPITALS; RENEWABLE ENERGY SOURCES; BURNERS; CALORIFIC VALUE

10217 (ETDE-DE–25, pp. 7-18) **Energy consumption in public buildings - analysis of the current situation, energy conservation potentials, energy management.** Schulze, L. (ARENHA GmbH, Hannover (Germany)); Siepe, B. Kommunalverband Grossraum Hannover (Germany). Oct 1993. 105p. (In German). In *Energy conservation in public buildings. Subjects.* Order Number DE95755761. Source: OSTI; NTIS (US Sales Only).

Energy consumption data of 1500 public buildings were collected within the framework of a carbon dioxide reduction study on behalf of Kommunalverband Grossraum Hannover. This paper informs about the measured energy consumption values. Based on these values energy conservation potentials are pointed out and scenarios are outlined for future developments. Schools and hospitals are of particular importance as regards heating energy consumption. Energy consumption reductions of more than 50% require consistent energy management measures. (DV)

10218 (ETDE-DE–25, pp. 19-22) **Computer-aided energy consumption monitoring and energy cost control for public buildings.** Zeine, C. (ages GmbH, Muenster (Germany)). Kommunalverband Grossraum Hannover (Germany). Oct 1993. 105p. (In German). In *Energy conservation in public buildings. Subjects.* Order Number DE95755761. Source: OSTI; NTIS (US Sales Only).

A nation-wide public building energy conservation study and individual municipal public building energy conservation analyses revealed considerable economic energy conservation potentials. Assuming an economic potential of 50%, 23% were saved on the average. The length of energy management periods and the actual efficiency of energy conservation were found to be correlated. The Ekomm program is a special community energy management program which comprises regular energy consumption checks, energy consumption value calculations, energy report support and energy auditing functions. (DV)

10219 (ETDE-DE–25, pp. 23-29) **Implementation of energy conservation measures in public buildings, as shown with the example of the Fischbeck school center.** Schulze, L. (ARENHA GmbH, Hannover (Germany)); Wagner-Kaul, A. Kommunalverband Grossraum Hannover (Germany). Oct 1993. 105p. (In German). In *Energy conservation in public buildings. Subjects.* Order Number DE95755761. Source: OSTI; NTIS (US Sales Only).

An energy expertise prepared for the Fischbeck center school provided the basis of suggestions for energy consumption improvements, i.e. improvements in thermal insulation, insulating glazings, exchange of fluorescent tubes, adaptation of the capacity of boilers and pumps, space- and time-dependent heat dissipation control. (DV)

10220 (ETDE-DE–25, pp. 31-39) **The Schiffdorf energy model for the Spaden elementary school.** Roemer, U. (ibek GmbH, Bremen (Germany)). Kommunalverband Grossraum Hannover (Germany). Oct 1993. 105p. (In German). In *Energy conservation in public buildings. Subjects.* Order Number DE95755761. Source: OSTI; NTIS (US Sales Only).

Within the framework of public building energy conservation measures in the community of Schiffdorf the Spaden elementary school was selected first for retrofitting on account of its out-of-date heating systems and insufficient thermal insulation. Since retrofitting of the heating systems alone would have lead to unsatisfactory results, a more detailed energy model was commissioned which in addition to heating systems considers the heat demand side (thermal insulation of walls, solar energy utilization for water heating in the gym). The results of the study and the suggestions made are presented. (DV)

10221 (ETDE-DE–25, pp. 41-51) **Solar energy utilization at a day-care center - Kita-Suedstadt, Braunschweig, Nietzschestr. 22.** Knobbe, M. (Stadt Braunschweig (Germany). Hochbauamt). Kommunalverband Grossraum Hannover (Germany). Oct 1993. 105p. (In German). In *Energy conservation in public buildings. Subjects.* Order Number DE95755761. Source: OSTI; NTIS (US Sales Only).

The day-care center which is under construction in the southern part of the city of Braunschweig will be provided with a waste water utilization system and a solar water heating system. According to calculations the solar water heating system will cover most of the hot water demand from May to August. In view of the present energy prices, the payback period of the solar water heating system is 76.5 years while its expected service life amounts to only 20 years. (DV)

10222 (ETDE-DE–25, pp. 57-63) **Retrofitting of the Neustadt a. Rbge. district hospital with regard to energy conservation.** Roth, H. Kommunalverband Grossraum Hannover (Germany). Oct 1993. 105p. (In German). In *Energy conservation in public buildings. Subjects.* Order Number DE95755761. Source: OSTI; NTIS (US Sales Only).

Within the framework of a study the energy characteristics of 200 hospitals were determined and were evaluated using a one-to-ten classification system. The energy consumption was analyzed and energy conservation potentials were assessed for all class four and higher-classed hospitals. Feasible energy conservation measures and their implementation are described discussing the example of the Neustadt a. Rbge. district hospital whose fuel consumption was reduced by 60% and whose electric power consumption was reduced by as much as 50% in some cases. (DV)

10223 (ETDE-DE–25, pp. 79-84) **High-efficiency burners as part of the heating services offered by Stadtwerke Hannover AG.** Brune, R. (Stadtwerke Hannover AG (Germany)). Kommunalverband Grossraum Hannover (Germany). Oct 1993. 105p. In *Energy conservation in public buildings. Subjects.* Order Number DE95755761. Source: OSTI; NTIS (US Sales Only).

The potential efficiency of heating systems today rarely exceeds 70%. Although 25% can be saved each year through modern heating technologies, landlords do not profit much by such savings and are, therefore, hardly interested in investments. The heating services offered by Stadtwerke Hannover AG are based on the

principle of heat supply. The new heating systems are planned, financed and operated by the supplier. Details are given about these services. (DV)

10224 (ETDE-DE–25, pp. 85-95) **Technico-economic aspects of energy controlling in public buildings.** Hoeflich-Haeberlein, L. (BEM, Kassel (Germany)). Kommunalverband Grossraum Hannover (Germany). Oct 1993. 105p. (In German). In *Energy conservation in public buildings. Subjects.* Order Number DE95755761. Source: OSTI; NTIS (US Sales Only).

Public-building energy demands are boosted by factors such as insufficient thermal insulation, out-of-date heating systems, and the waste of energy by careless end users. Energy services are a cost saving alternative to investments in new systems which are often avoided on account of the communities' bad financial situation. These services comprise direct heat services, power-saving contracts, and the foundation of energy companies by the communities. Organizational options are outlined for each of the three possibilities. Two examples are given of energy controlling. (DV)

10225 (LUTMDN-TMVK–3167) **Load management in dwellings. Computer simulations.** Pyrko, J.; Qvistbaeck, P. Lund Univ. (Sweden). Dept. of Heat and Power Engineering. Oct 1994. 63p. (In Swedish). Project BFR-870473-7. Order Number DE95745005. Source: OSTI; NTIS.

This study is part of a larger project on power management in energy supply systems for buildings, with the aim to analyze the potential for power limitation in dwellings without appreciable influence on comfort. Simulations were performed using the program tsbi3, applied to three existing one-family houses, built in Lund 1964, 1983 and 1991, which can be regarded as typical for houses of the respective building norms. The study shows that load limitations leading to temperature reduction/increases of 3-4 deg C for 3-4 hours are acceptable for the occupants. The total power savings have been deduced. The energy conservation from load management is negligible. 19 refs, 35 figs, 5 tabs

10226 (NEI-DK–1820) **The Danish daylighting programme.** Kristensen, P.E. (Esbensen Consulting Engineers (Denmark)); Petersen, E.; Aggerholm, S.; Johnsen, K.; Christoffersen, J. Esbensen Raadgivende Civilingenioerer, Virum (Denmark); Dansk Teknologisk Inst., Taastrup (Denmark); Statens Byggeforskningsinstitut, Hoersholm (Denmark). 1993. 15p. Contract ENS-1213/93-0009; Contract ENS-1213/92-0010. (CONF-930982–1: 2. European conference on energy-efficient lighting: right light, Arnhem (Netherlands), 26-29 Sep 1993). Order Number DE95744850. Source: OSTI; NTIS.

EFP-93; EFP-92.

The Danish daylighting research programme is funded by the Danish Energy Agency, and the programme runs through 1991-1995. This programme is jointly undertaken by Esbensen Consulting Engineers, the Danish Building Research Institute and the Danish Technological Institute. The main objectives of the program is to investigate and document daylighting techniques to be used in non-domestic buildings. The techniques are sidelighting techniques such as reflective blinds and louvers, and reflective light shelves. The systems are being tested in a new daylighting testing laboratory which has been built at the Danish Technological Institute. in this laboratory, control systems for artificial lighting are also being tested. Improved use of daylighting in existing buildings is also being investigated. This is done through case studies on buildings, where alternatives for renovation of window systems, shading systems and lighting systems are being evaluated. The use of daylighting is seen as an integrated part of the overall energy strategy of the building. The energy consumption for heating, cooling, ventilation and lighting is modelled using the tsbi 3 computer model, and using the ADELINE programme package for daylighting modelling. Recently a new pan-European daylighting research programme has been proposed for the EC JOULE II programme. This programme is proposed by a group of energy and daylighting specialists throughout Europe. The main objectives of this project is to monitor the daylighting performance of 17 selected buildings throughout Europe and to document the results in high quality case studies. The objective is further to analyze the various daylighting techniques for non-domestic buildings. These results will be documented in 'Daylighting Design Guidelines for European Buildings', the main deliverable of the project. (au)

10227 (PNL–10259) **Development of an energy-use estimation methodology for the revised Navy Manual MO-303.** Richman, E.E.; Keller, J.M.; Wood, A.G.; Dittmer, A.L. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95007524. Source: OSTI; NTIS; GPO Dep.

The U.S. Navy commissioned Pacific Northwest Laboratory (PNL) to revise and/or update the Navy Utilities Targets Manual, NAVFAC MO-303 (U.S. Navy 1972b). The purpose of the project was to produce a current, applicable, and easy-to-use version of the manual for use by energy and facility engineers and staff at all Navy Public Works Centers (PWCs), Public Works Departments (PWDs), Engineering Field Divisions (EFDs), and other related organizations. The revision of the MO-303 manual involved developing a methodology for estimating energy consumption in buildings and ships. This methodology can account for, and equitably allocate, energy consumption within Navy installations. The analyses used to develop this methodology included developing end-use intensities (EUIs) from a vast collection of Navy base metering and billing data. A statistical analysis of the metering data, weather data, and building energy-use characteristics was used to develop appropriate EUI values for use at all Navy bases. A complete Navy base energy reconciliation process was also created for use in allocating all known energy consumption. Initial attempts to use total Navy base consumption values did not produce usable results. A parallel effort using individual building consumption data provided an estimating method that incorporated weather effects. This method produced a set of building EUI values and weather adjustments for use in estimating building energy use. A method of reconciling total site energy consumption was developed based on a "zero-sum" principle. This method provides a way to account for all energy use and apportion part or all of it to buildings and other energy uses when actual consumption is not known. The entire text of the manual was also revised to present a more easily read understood and usable document.

10228 (PNL–10277) **Performance and economic evaluation of the seahorse natural gas hot water heater conversion at Fort Stewart. Interim report, 1994 Summer.** Winiarski, D.W. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 92p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95005444. Source: OSTI; NTIS; GPO Dep.

The federal government is the largest single energy consumer in the United States cost valued at nearly $10 billion annually. The US Department of Energy's (DOE) Federal Energy Management Program (FEMP) supports efforts to reduce energy use and associated expenses in the federal sector. One such effort, the New Technology Demonstration Program (NTDP), seeks to evaluate new energy-saving US technologies and secure their more timely adoption by the US government. Pacific Northwest Laboratory (PNL) is one of four DOE laboratories that participate in the New Technologies Demonstration Program, providing technical expertise and equipment to evaluate new, energy-saving technologies being studied under that program. This interim report provides the results of a field evaluation that PNL conducted for DOE/FEMP and the US Department of Defense (DoD) Strategic Environmental Research and Development Program (SERDP) to examine the performance of a candidate energy-saving technology-a hot water heater conversion system to convert electrically heated hot water tanks to natural gas fuel. The unit was installed at a single residence at Fort Stewart, a US Army base in Georgia, and the performance was monitored under the NTDP. Participating in this effort under a Cooperative Research and Development Agreement (CRADA) were Gas Fired Products, developers of the technology; the Public Service Company of North Carolina; Atlanta Gas Light Company; the Army Corps of Engineers; Fort Stewart; and Pacific Northwest Laboratory.

10229 (PNL–10289) **FEDS user's guide: Facility energy screening. Release 2.10.** Dirks, J.A. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 203p. Sponsored by USDOE,

Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95005726. Source: OSTI; NTIS; GPO Dep.

The Facility Energy Decision Screening (FEDS) Model is under development at Pacific Northwest Laboratory (PNL) for the US DOE Federal Energy Management Program (DOE-FEMP) and the US Army Construction Engineering REsearch Laboratory (USA-CERL). FEDS is a multi-level energy analysis software system designed to provide a comprehensive approach to fuel-neutral, technology-independent, integrated (energy) resource planning and acquisition. The FEDS system includes Level-1, which is a top-down, first-pass energy systems analysis and energy resource acquisition decision software model for buildings and facilities, and the Level-2 software model, which allows specific engineering inputs and provides detailed output. The basic intent of the model is to provide an installation with the information necessary to determine the minimum life-cycle cost (LCC) configuration of the installation's energy generation and consumption infrastructure. The model has no fuel or technology bias; it simply selects the technologies that will provide an equivalent or superior level of service (e.g., heating, cooling, illumination) at the minimum LCC.

10230 (PNL–10357-Vol.1) **1992-1993 Bonneville Appliance Efficiency Program: Showerhead evaluation. Volume I - report.** Warwick, W.M. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95007272. Source: OSTI; NTIS; GPO Dep.

The Bonneville Power Administration (Bonneville) provides wholesale electric power to over 100 retail distribution utilities in the Pacific Northwest. Bonneville is faced with meeting growing loads from these utilities. It acquires conservation as one means of meeting this load growth. Bonneville has offered a variety of conservation programs since 1980. Efficient showerheads have been a feature in residential conservation programs ever since. Bonneville launched the Residential Appliance Efficiency Program to focus on water-heater energy conservation opportunities in 1992. The Residential Appliance Efficiency Program consists of two parts, a water-heater efficiency program, and a hot-water efficiency program. This report evaluates the savings and costs of the first two years of the showerhead portion of the Residential Appliance Efficiency Program (the showerhead program). Although it is not a formal evaluation of the program limited to implementation or a "process" evaluation, observations about program design and implementation are included as appropriate. Results of this evaluation are limited to program participants within the Bonneville service territory.

10231 (PNL–10372) **Affordable housing: Reducing the energy cost burden.** Lee, A.D.; Chin, R.I.; Marden, C.L. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95006830. Source: OSTI; NTIS; GPO Dep.

Residential energy expenditures are a key determinant of housing affordability, particularly for lower Income households. For years, federal, state and local governments and agencies have sought to defray energy expenses and Increase residential energy efficiency for low Income households through legislative and regulatory actions and programs. Nevertheless, household energy costs continue to place a major burden on lower Income families. This issue paper was written to help formulate national energy policy by providing the United States Department of Energy's (DOE's) Office of Energy Efficiency and Renewable Energy (EE) with Information to help define the affordable housing issue; Identify major drivers, key factors, and primary stakeholders shaping the affordable housing issue; and review how responding to this Issue may impact EE's goals and objectives and Influence the strategic direction of the office. Typically, housing affordability is an Issue associated with lower income households. This issue paper adopts this perspective, but it is important to note that reducing energy utility costs can make "better' housing affordable to any household regardless of income. As energy efficiency is improved throughout all sectors of the economy, special consideration must be given to low income households. Of all households, low income households are burdened the most by residential energy costs; their residences often are the least energy-efficient and have the greatest potential for efficiency improvements, but the occupants have the fewest resources to dedicate to conservation measures. This paper begins with a definition of "affordability" as it pertains to total housing costs and summarizes several key statistics related to housing affordability and energy use by lower income households.

10232 (PNL–10392) **Office of Codes and Standards resource book. Section 1, Building energy codes and standards.** Hattrup, M.P. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95006369. Source: OSTI; NTIS; GPO Dep.

The US Department of Energy's (DOE's) Office of Codes and Standards has developed this Resource Book to provide: A discussion of DOE involvement in building codes and standards; a current and accurate set of descriptions of residential, commercial, and Federal building codes and standards; information on State contacts, State code status, State building construction unit volume, and State needs; and a list of stakeholders in the building energy codes and standards arena. The Resource Book is considered an evolving document and will be updated occasionally. Users are requested to submit additional data (e.g., more current, widely accepted, and/or documented data) and suggested changes to the address listed below. Please provide sources for all data provided.

10233 (PNL-SA–24594) **Comparison of energy assessment methods and tools at Bolling Air Force Base.** Dixon, D.R.; Wrench, L.E.; McMordie, K.L. Pacific Northwest Lab., Richland, WA (United States). Dec 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941218–4: 17. world energy engineering congress and the 4th environmental technology congress and expo, Atlanta, GA (United States), 7-9 Dec 1994). Order Number DE95007275. Source: OSTI; NTIS; GPO Dep.

A plethora of energy efficiency assessment tools have been designed for federal installations, identifying the energy savings potential and attractive projects for capital investment. These methods range from high-level estimating tools to detailed design tools, both manual and software assisted. These methods have different purposes and provide results that are used for different parts of the project identification and implementation process. This paper's objective is to compare and contrast a number of energy efficiency assessment methods and tools based on their application to a selected set of buildings at Bolling Air Force Base (AFB). To some extent this comparison is much like a 'Consumer Report" evaluation of the various assessment methods, comparing the features and potential uses of each. Because of the range of methods included, direct comparison of the quantitative results at Bolling AFB was limited to two or three methods at a time which were applied to the same buildings and/or technologies. The results are largely a qualitative comparison of the capabilities of each method, where they can and should be used to identify and implement projects, how much it costs to use the methods, and the type of output to expect. This comparison should be of value to energy managers at federal sites that need to select the appropriate tools to use in assessing energy opportunities.

10234 (PNL-SA–25659) **EPAct and the model code.** Connell, L.M. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950267–1: Blow in blanket insulation conference, Phoenix, AZ (United States), 10 Feb 1995). Order Number DE95007276. Source: OSTI; NTIS; GPO Dep.

The purpose of this presentation is to provide an introduction to the Council of American Building Officials (CABO) 1992 Model Energy Code (MEC); to describe the status of its adoption, implementation, and enforcement; and to introduce a line of MEC compliance materials, collectively referred to as the MECcheck™ materials.

10235 (VTT-TIED–1590) **Environmental impact of building materials.** Haekkinen, T. (VTT Building Technology, Espoo (Finland). Concrete and Minerals Technology). Technical Research

Centre of Finland, Espoo (Finland). 1994. 38p. Order Number DE95744868. Source: OSTI; NTIS.

Research into the environmental impact of building materials and the methods for its evaluation has been carried out at VTT Building Technology Institute. This report discusses the principles and problems of LCA and suggests guidelines for evaluating the environmental impact of building materials. The guidelines are based on the life-cycle assessment (LCA) procedure suggested by SETAC. At least the following can be identified as special characteristics or problems in the LCA of building materials: Service life is usually long compared with ordinary consumer goods. The basic materials of building products such as rocky and clay materials, timber and gypsum are largely available. More important than the consumed materials is the means of removal and disposal. A considerable percentage of raw materials can be substituted by waste or co-products. At the same time, large amounts of co-products or re-usable waste of low value are generated in the course of production compared with the quantity of primary product. Thus the principles of allocating environmental burdens significantly affect the results of LCA. Selection of a well-defined functional unit in a building is complicated. Environmental impacts of wooden structural parts in house constructions were studied as a pattern. The environmental profile was calculated and compared with that of heating a small house. Structural timber, roof truss and cladding boards were studied separately. The effects of system boundary and limitations on the results were investigated. The dominate parts in the life span of wooden products were discussed from an environmental point of view.

10236 (ETDE-DE–25, pp. 65-73) **Energy conservation and energy management in the case of municipal sewage and sewage sludge disposal.** Kann-Dehn, T. (Ingenieur-Gemeinschaft agwa GmbH, Norden (Germany)). Kommunalverband Grossraum Hannover (Germany). Oct 1993. 105p. (In German). In *Energy conservation in public buildings. Subjects.* Order Number DE95755761. Source: OSTI; NTIS (US Sales Only).

There is a large energy conservation potential in municipal sewerage and sewage treatment. Eight communities were evaluated with regard to the annual energy demands of their local facilities. It was found that sewage disposal in rural areas swallows 37 to 65% of the energy supplies. Energy consumption reduction potentials are in sewage systems and in sewage treatment plants (sewage treatment, sewage sludge treatment). (DV)

10237 (ETDE-DE–25, pp. 75-78) **Energy conservation in the case of street lighting systems.** Baenziger (comp.) (HEPA GmbH, Goettingen (Germany)). Kommunalverband Grossraum Hannover (Germany). Oct 1993. 105p. (In German). In *Energy conservation in public buildings. Subjects.* Order Number DE95755761. Source: OSTI; NTIS (US Sales Only).

Energy conservation investments in lighting systems pay off within periods of 2 to 3 years. Since, into the bargain, the service life of such systems is prolonged through controlled lighting, investments in lighting system energy conservation are particularly cost-effective. The control of gas discharge lamps in the community of Rosdorf near Goettingen, Germany, reveals the economic efficiency of such investments. (DV)

10238 (SAND–95-8208) **An analysis of the costs of running a station car fleet.** Zurn, R.M. Sandia National Labs., Albuquerque, NM (United States). Feb 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95007551. Source: OSTI; NTIS; GPO Dep.

Station cars are electric vehicles available at transit stations which may be used for transportation between the transit station and home, work, and/or for errands. This transportation service would be provided by the local transit agency. This report discusses an economic model of the costs of running a station car fleet. While some of these costs are highly uncertain, this analysis is a first look at the required user fees for full cost recovery. The model considers the capital costs of the vehicles and the required infrastructure; the annual fixed vehicle costs for insurance, registration, etc.; the mileage-based costs; and the annual non-vehicle costs for administration, infrastructure maintenance, etc. The model also includes various factors such as the fleet size, the annual mileage, the number of transit stations that would have facilities for station cars, and the number of users. The model specifically examines the cost of using of electric vehicles; however, for comparison, the cost of using a fleet of gasoline-powered vehicles also is calculated. This report examines the sensitivity of the model to the various factors. A principal conclusion from the analysis is that the largest cost contributor is the initial vehicle purchase price. For a given initial purchase price, the factor driving the user fee required for full cost recovery is the number of different daily users of a vehicle. The model also compares the annual cost of transportation using station cars and mass transit to the annual cost of solo commuting. If a station car is used by more than one person a day, and this use replaces the ownership of a conventional vehicle, the annual cost of transportation may be similar. However, for the base case assumptions, the station car user fee required for full cost recovery is higher than the cost of solo commuting.

10239 (ANL/ES/CP–84262) **Economic evaluation of auto shredder residue pyrolysis plant design using process simulation software.** Brockmeir, F.E.; McIntosh, M.J. Argonne National Lab., IL (United States). Nov 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941128–4: Annual meeting of the American Institute of Chemical Engineers, San Francisco, CA (United States), 13-18 Nov 1994). Order Number DE95005853. Source: OSTI; NTIS; GPO Dep.

ASPEN PLUS, a well-known process simulator, has been used to simulate seven pyrolysis processes. The feed is assumed to be Automobile Shredder Residue (ASR), a waste material concentrated in mixed plastics (discussed briefly below). Each process uses either a rotary kiln reactor or a fluidized-bed reactor to produce gas, char, and liquids by pyrolyzing ASR. Six of the reactor types are well known; the seventh (DRKA) is fictitious. The processes are as follows: (1) Rotary Kiln (RK) - Solids are pyrolyzed in a conventional calciner or rotary kiln in indirect service. In this case, light pyrolysis gas and liquid are used as fuel, producing pyrolysis heat, which is conducted through the kiln shell to heat the incoming solids. (2) Rotary Kiln with char combustion (RKC) - Solids are pyrolyzed in a conventional indirectly heated rotary kiln, which has added equipment for solids combustion; char from pyrolysis is used as fuel producing pyrolysis heat. (3) Double Fluidized Bed (DFB) - Solids are pyrolyzed in a sand bed fluidized by recycled light product gas; pyrolysis heat is provided somewhat directly by burning char, liquids, and gas in a second combustion bed of sand fluidized by air. (4) Double Fluidized Bed with steam (DFBS) - Solids are pyrolyzed in a sand bed fluidized by steam; pyrolysis heat is provided by burning char, liquids, and gases in a second combustion bed of sand fluidized by air. (5) Fluidized Bed (FB) - Solids are pyrolyzed in a single fluidized bed of ASR and sand, the fluidizing medium is recycled light product gas. (6) Fluidized Bed with steam (FBS) - Solids are pyrolyzed in a single fluidized bed of ASR and sand; the fluidizing medium is superheated steam. (7) Nonseparatory Double Rotary Kiln (DRKA) - Solids are pyrolyzed in the inner chamber of a double kiln much like an indirectly heated kiln, except in this case the solids are assumed to be combusted without the expense of external char handling.

10240 (CONF-9306403–1) **Monitoring and controlling moisture during carpet and textile drying.** Robinson, J.W. Drying Technology, Inc., Silsbee, TX (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG46-92R699203. From High technology textile meeting; Greenville, SC (United States); Jun 1993. Order Number DE95005993. Source: OSTI; NTIS; GPO Dep.

Industrial dryer/moisture control is usually performed by feedback type systems, i.e., sensors indirectly measure moisture content

(MC) of the product after it leaves the dryer, or exhaust temperature from the last zone is used as an indicator of the existing MC. Such a control system is inherently weak because of the "after-the-fact" nature of the MC data. A feedback system may be improved by adding feedforward loops to handle disturbances to the system, e.g., variations in entering MC and feed rate. Such additions to the control system are expensive and require higher expertise for operating and maintaining. If the MC of the product could be measured inside the dryer, a control system could be offered that would be superior to feedback/feedforward types. This has not been possible up to this time because no MC sensor was capable of withstanding the atmosphere inside dryers. Moreover, the sample size would not have been large enough to be representative.

10241 (DOE/AL/99286–T3) **Federal assistance project status report. Third quarterly report, October 1, 1994–December 31, 1994.** Maine Metal Products Association, Portland, ME (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG04-94AL99286. Order Number DE95006249. Source: OSTI; NTIS; GPO Dep.

The third quarter report of the Federal Assistance Project with the Maine Metal Products Association focuses on the tasks, performance variances, accomplishments, and problems of implementing an Environmentally Conscious Manufacturing (ECM) Project. The nine tasks the project encompasses are: 1. Administer project; 2. Industry needs/opportunities assessment; 3. Develop and maintain an Assessment Team and Tech-Source Team; 4. Coordinate ongoing program of basic ECM assessments; 5. Develop and implement program of packaged technical assistance; 6. Develop and administer ECM technology fund; 7. Facilitate industry attendance at conferences and study tours; 8. Establish ECM clearinghouse of information; 9. Provide worker training in ECM. The report outlines the progress made in these areas from October 1994 through December 1994.

10242 (DOE/AL/99286–T4) **Environmentally Conscious Manufacturing Project: ECM assessment guidance manual.** Maine Metal Products Association, Portland, ME (United States). Nov 1994. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG04-94AL99286. Order Number DE95007983. Source: OSTI; NTIS; GPO Dep.

The purpose of this document is to provide a summary of the basic tools that will be used in conducting assessments under the Environmentally Conscious Manufacturing (ECM) Project assessment program. ECM can cover a wide range of issues including: finding safer alternatives to toxic materials; changing processes to become more efficient; environmental costs and regulatory compliance; waste reduction; energy conservation; product packaging; and product reuse/recycling. The assessments performed as part of this program will try to identify opportunities to implement technologies/actions that will promote the types of results listed above. The general methodology, or sequence of events, that will be used in conducting assessments is as follows: 1. Form an Assessment Team; 2. Map Process by flow diagrams and materials accounting; 3. Identify opportunities for ECM by activity based accounting and pareto analysis; 4. Identify and evaluate ECM/pollution prevention alternatives; 5. Implement alternatives; 6. Monitor progress. All of the assessment steps listed above are addressed in this document except forming the assessment team. The tools discussed in this document are well known, widely used process analysis or quality improvement tools which have been adapted for use in evaluating opportunities for ECM/Pollution prevention.

10243 (DOE/CE/23810–48D) **Investigation into the fractionation of refrigerant blends. Quarterly technical status report No. 2, July 1, 1994–September 30, 1994.** Biancardi, F. (United Technologies Research Center, East Hartford, CT (United States)). Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States). Oct 1994. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. (UTRC-R–94-970566-2). Order Number DE95006647. Source: OSTI; NTIS; GPO Dep.

While refrigerant blends offer performance advantages, there are apparently significant service and operational issues raised by the use of these blends. The objective of this ARTI-sponsored program is to conduct analytical and laboratory tests aimed at understanding the fractionation of refrigerant blends, developing approaches or techniques to predict these effects and/or overcome these potential problems.

10244 (DOE/CE/40740–T8) **A comprehensive program to develop correlations for the physical properties of Kraft black liquor. Interim report No. 3.** Fricke, A.L.; Dong, D.J.; Schmidl, G.W.; Stoy, M.A.; Zaman, A.A. Florida Univ., Gainesville, FL (United States). Sep 1993. 93p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85CE40740. Order Number DE95005300. Source: OSTI; NTIS; GPO Dep.

The black liquor properties program has been conducted over this last period so as to systematically collect data on properties, liquor composition, and lignin characteristics very carefully by methods that have developed during this program. Complete data has been collected for Slash Pine black liquors made by experimental pulping at different pulping conditions. In addition, data has been collected for mill liquors and partial properties or composition data has been collected on Slash Pine black liquors. Data reduction methods have been developed or extended for correlation of viscosity, heat capacity, heat of dilution, and density. Correlation of properties to pulping conditions and of composition to. pulping conditions has begun. In most cases, data reduction methods have been developed that are fundamentally based and that have been shown to be generally applicable to all black liquors. In the near future, we fully expect to accomplish our goal of developing generalized correlations relating physical properties of Slash Pine kraft black liquors to liquor composition. This interim report reviews the methods used, describes examples of data reduction methods that have been developed, and presents some preliminary results for correlation of liquor composition and properties to pulping conditions for Slash Pine black liquors.

10245 (DOE/CE/40972–T1) **Development of an alternative kraft black liquor recovery process based on low-temperature processing in fluidized beds. Final technical report on Annex 9, Task 1.** Kubes, G.J. McGill Univ., Montreal, PQ (Canada). 24 Mar 1994. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE40972. Order Number DE95007118. Source: OSTI; NTIS; GPO Dep.

The overall objective of this research program was to provide the fundamental knowledge and experimental data from pilot scale operation for an alternative black liquor recovery technology which would have a higher overall energy efficiency, would not suffer from the smelt-water explosion hazard and would be lower in capital cost. In addition, the alternative process would be more flexible and well suited for incremental recovery capacity or for new pulping processes, such as the new sulfide-sulfide-AQ process. The research program consists of number of specific research objectives with the aim to achieve the ultimate objective of developing an alternative recovery process which is shown in Figure 1. The specific objectives are linked to individual unit operations and they represent the following research topics: (1) superheated steam drying of kraft black liquors; (2) fast pyrolysis of black liquor; (3) hydrogen sulfide absorption from flue gas; (4) reduction of sodium sulfate in solid phase with gaseous hydrogen; and (5) verification of the fundamental results in fluidized bed pilot plant. The accomplishments in each of these objectives are described.

10246 (DOE/R0/20323–T1) **Cullet feedstock purification using advanced optical sortation. Quarterly technical progress report, October 1, 1993–December 31, 1993.** Kendall, M.W. Oregon State Dept. of Energy, Salem, OR (United States). Conservation Resources Div. 28 Jan 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG51-93R020323. Order Number DE95005575. Source: OSTI; NTIS; GPO Dep.

Progress is reported for October–December 1993 on the contract between the Oregon Department of Energy and Alpine technology concerning the development of equipment for glass sorting by color for the purpose of glass recycling. The financial status of the project is reported along with the planning, design, assembly and evaluation progress. Attachments to this report include project Gantt chart, updated system schematic and a couple news articles about the project.

10247 (DOE/R0/20323–T2) **Cullet feedstock purification using advanced optical sortation. Quarterly technical progress report, January 1, 1994–March 31, 1994.** Kendall, M.W. Oregon State Dept. of Energy, Salem, OR (United States). Conservation Resources Div. May 1994. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG51-93R020323. Order Number DE95005576. Source: OSTI; NTIS; GPO Dep.

Progress is reported for January–March 1994 for the contract between the Oregon Department of Energy and Alpine Technology concerning the development of equipment for sorting glass by color to be used in glass recycling. Finances, planning, design, assembly, and evaluation information is reported. Attachments to this report include a current project Gantt chart, a statement of work for the Oregon State University contract and a copy of the marketing survey proposal.

10248 (DOE/R0/20323–T3) **Cullet feedstock purification using advanced optical sortation. Quarterly technical progress report, July 1, 1994–September 30, 1994.** Kendall, M.W. Oregon State Dept. of Energy, Salem, OR (United States). Conservation Resources Div. 30 Oct 1994. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG51-93R020323. Order Number DE95005577. Source: OSTI; NTIS; GPO Dep.

Progress is reported for July–September 1994 on the contract between the Oregon Department of Energy and Alpine Technology concerning the development of a system to sort glass by color for the purpose of glass recycling. Financial status and the project status to include planning, design, assembly, and evaluation are reported. Attachments to this report include a summary of findings by the University of Oregon Business School marketing report, the EnviroNews article on Alpine Technology, the Cullet Master 1000 technology brief and miscellaneous project design drawings.

10249 (EGG-M–94081) **An overview of the Noncyanide Metal Stripper program conducted at Kelly Air Force Base.** Argyle, M.D.; Cowan, R.L. Colorado State Univ., Fort Collins, CO (United States). Dept. of Mechanical Engineering. [1995]. 6p. Sponsored by Department of Defense, Washington, DC (United States). (CONF-940336–2: 20. annual environmental symposium and exhibition, San Antonio, TX (United States), 14-17 Mar 1994). Order Number DE95005041. Source: OSTI; NTIS; GPO Dep.

The Noncyanide Metal Stripper Program was a waste minimization effort aimed at identifying and testing suitable noncyanide stripping solutions that could replace the cyanide stripping solutions found in the United States Air Force (USAF) Air Logistics Centers (ALC). The program started with laboratory testing of commercial stripping solutions. The performance of these solutions was compared with the cyanide process solutions C-101 and C-106 targeted for replacement. Plate metal stripping rate, basis metal corrosion, and compatibility with masking materials and biodegradability were all used to determine the performance of each product. Those products that passed the acceptance criteria were field tested using 25 to 50-gallon solutions to determine optimum operating conditions, stripper maintenance requirements, and maximum solution loading and longevity. The program included investigating any adverse effects these new products might have on existing chemical and biological waste treatment processes. All cyanide stripping solutions at the San Antonio Air Logistics Command Center have been successfully replaced with commercial noncyanide products. Generally, these replacements were less toxic and generated less waste and had longer lifetimes than their cyanide counterparts.

10250 (ETDE-DE–39) **Application on-oriented fundamental research on electrochromic layers for controlling the total energy transmission rate of windows, illustrated by the example of window panes. Development of fundamentals for a novel backplate electrode. Final report.** Hartmann, R. (Battelle-Institut e.V., Frankfurt am Main (Germany)); Ganson, G.; Ronge, W.; Tschentscher, A. Schueco International KG, Bielefeld (Germany); Battelle-Institut e.V., Frankfurt am Main (Germany). Aug 1994. 86p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 13N5846. Order Number DE95755596. Source: OSTI; NTIS (US Sales Only).

The report discusses the development of a novel backplate electrode material for cells that can be darkened electrochromically, especially as components of electrochromically darkenable windows in thin film technology. (HW)

10251 (KCP–613-5535) **Housing development for plasma electrode pockel cells. Final report.** Stubenhofer, R.L. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Jan 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE95006179. Source: OSTI; NTIS; GPO Dep.

The ability to produce metal machined products with deep pockets and thin walls is a critical feature of the Kansas City Plant. Lawrence Livermore National Laboratories' upgrade of the NOVA Laser in preparation for the National Ignition Facility (NIF) offered the opportunity to exercise and maintain this capability on a limited scope project. Their purpose was to evaluate the feasibility of replacing the current PEPC (plasma electrode pockel cell) housings with aluminum structurally robust housings and associated hardware. When completed, the National Ignition Facility will provide other alternatives for nuclear testing to maintain the enduring stockpile. The NOVA laser is the precursor to this development.

10252 (KU-HCOE-NBI-R–1994-07) **Optimal analysis of primary performance parameters for an endoreversible absorption heat pump.** Jincan Chen; Andresen, B. Niels Bohr Inst. for Astronomi, Fysik og Geofysik, Copenhagen (Denmark). Oersted Lab. 1994. 25p. Contract CIPA-CT92-4026. Order Number DE95755106. Source: OSTI; NTIS.

The cycle model of heat-engine-driven heat pump is used to study the performance of an absorption heat pump affected by heat resistances. The coefficient of performance of the absorption heat pump is adopted to be the objective function for optimization. The optimal regions of the coefficient of performance and the specific heating load are detehmined. The optimal relations between the heat transfer areas of the four heat exchangers involved and the coefficient of performance or the specific heating load of an absorption heat pump are obtained. Problems concerning the optimal design of an absorption heat pump are also discussed. (au) (20 refs.)

10253 (KU-HCOE-NBI-R–1994-09) **The maximum coefficient of performance of thermoelectric heat pumps.** Jincan Chen; Andresen, B. Niels Bohr Inst. for Astronomi, Fysik og Geofysik, Copenhagen (Denmark). Oersted Lab. 1994. 21p. Contract CIPA-CT92-4206. Order Number DE95755108. Source: OSTI; NTIS.

The effect of three main irreversibilities existing in thermoelectric devices on the performance of a thermoelectric heat pump is investigated. The coefficient of performance and the heating load of the heat pump are derived. The optimal performance of the heat pump at maximum coefficient of performance is discussed, and the rational working region of the heat pump is determined. The optimal structure of the device is also described. The results obtained here are more realistic than those derived from non-equilibrium thermodynamics. (au) (12 refs.)

10254 (KU-HCOE-NBI-R–1994-10) **Diagram representation of the optimal performance of an endoreversible Carnot engine at maximum power output.** Jincan Chen; Andresen, B. No corporate text available. 1994. 19p. Contract CHRX-CT92-0007. Order Number DE95755109. Source: OSTI; NTIS.

It is shown that for three different arrangements of heat resistances the standard optimal performance criteria of endoreversible Carnot engines at maximum power output can be conveniently expressed by two simple diagrams. It is also pointed out that such diagrams rightfully should be referred to as Bejan diagrams. (au) (19 refs.)

10255 (KU-HCOE-NBI-R–1994-11) **Optimal performance of an endoreversible Carnot heat engine used as a boiler.** Jincan Chen; Andresen, B. Niels Bohr Inst. for Astronomi, Fysik og Geofysik, Copenhagen (Denmark). Oersted Lab. 1994. 20p. Contract CIPA-CT92-4026. Order Number DE95755110. Source: OSTI; NTIS.

The optimal performance of an endoreversible Carnot heat engine used as a cooler is investigated on the basis of a simple cycle model. The cooling rate of the cooler is optimized for specified power input and total heat transfer area of the cooler. The optimal

ratio of the two heat transfer areas of the cooler is derived. The optimal bounds of the primary performance parameters, such as the cooling rate, the power input, and the temperatures of the working substance in the cooler, are determined. The results obtained can serve as a good guide for the understanding of the performance of a real cooler and further improve the systematic theory of endoreversible Carnot cycles. (au) (11 refs.)

10256 (NEI-DK–1397) **Pressalit A/S, a firm which is a model for the efficient use of energy. Concluding report.** Pressalit A/S, Ry (Denmark). Sep 1993. 58p. (In Danish). Contract ENS-51191-91.0093. Order Number DE94740145. Source: OSTI; NTIS.

The Danish firm Pressalit A/S produces toilet seats made of a plastic material and bathroom equipment for elderly and disabled people. 90% of its products are exported and it employs 290 people. It has been chosen as one of 6 Danish firms which serve as models for the most efficient use of energy. The firm's amount and forms of energy consumption and methods of saving energy are described in detail. Most energy is used in relation to the ventilation system in the factory hall where the plastic components of the bathroom equipment are moulded in forms, here the quality of the air must be high in consideration for the health of the workers. The extent of necessary ventilation was reduced by 25% of electricity consumption and a further 3% was saved by lowering the temperature of the air blown into the hall. Energy savings were achieved by improving the general efficiency of the factory's compressors (reducing leakage etc.), cutting down on the lighting systems, installing automatic switch-off systems and adding reflectors. Monitoring of electricity, heat and water consumption was initiated by the firm. Savings in electricity consumption amounted to 15%, resulting from an investment of 85.000 Danish kroner. After one boiler was removed and the other retrofitted with new insulation material and with various new components, oil consumption dropped by 40%. (AB)

10257 (NEI-DK–1819) **Development of methods for the reduction of energy consumption in breweries.** Alroe Joergensen, J. (Danbrew Ltd. A/S (Denmark)); Frandsen, A.G.; Maagoe Petersen, P. Dambrew Ltd. A/S, Frederiksberg (Denmark). Mar 1994. 73p. (In Danish). Order Number DE95744852. Source: OSTI; NTIS. EFP-89.

A survey of the needs and potentials for establishing a basis for the design of a system for the supply of a brewery building with energy and water. A computerized simulation programme was set up to aid the design. The normal processes used in the brewery were observed in detail and the results of the observed energy consumption were compared with the calculated values based on the computer programme. It was concluded that the computer calculations matched those based on practical observation and thus that the programme was satisfactory although some minor divergences may be due to the quality of the data on which the programme was founded. The brewery's energy consumption, the energy efficiency, and the computer programme are described in detail. (AB) (53 refs.)

10258 (PNL-SA–24795) **Spent catalyst processing with electrochemistry.** Silva, L.J.; Bray, L.A.; Frye, J.G.; Buehler, M.F. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941175–1: 8. international forum on electrolysis in the chemical industry: environmental electrochemistry, Lake Buena Vista, FL (United States), 13-17 Nov 1994). Order Number DE95007270. Source: OSTI; NTIS; GPO Dep.

Increasing concern for pollution prevention and waste disposal has created a need for clean alternatives for spent catalyst processing. In addition, expanded use of catalysts for the production of fuels and chemical feedstocks will continue in response to (1) economic pressure to upgrade heavier crudes and other feeds having high levels of impurities; (2) competitive pressure to achieve higher conversions using less energy; and (3) pressure to increase reaction selectivities to minimize waste production. While the incentives for using catalysts are great, all catalysts gradually lose activity through coking; poisoning by metals, sulfur, or halides; or loss of surface area from sintering at high process temperatures. Regeneration is possible where the catalyst deactivation can easily be reversed. Electrochemical dissolution is a new technique to oxidize catalyst contaminants and dissolve catalyst metals in an aqueous solution for further recovery of the raw materials. The key to this process is adding spent catalyst to a solution containing small amounts of species that form kinetically active, strongly oxidizing ions such as cerium(IV) or silver(II). The oxidizing ions are regenerated at the anode; they act in a catalytic manner carrying electrons from the solid surface to the anode of the electrochemical cell. A cerium oxidizer was used for the experiments described in this paper. For this procedure, solution is added to the anode side of an electrochemical cell. At the anode, aqueous cerium(III) is oxidized to cerium(IV). The cerium(IV), in turn, oxidizes organic material adhered to the catalyst to carbon dioxide and water. Many spent catalysts used in hydrogenations contain metal sulfides that have contaminated the catalyst surface during processing. Metal sulfides are oxidized to dissolved metal ions and sulfur species. Because cerium is continuously reoxidized to cerium(IV) at the anode, a small amount of cerium is needed to oxidize the spent catalyst.

10259 (SAND–95-0092C) **Achieving agility through parameter space qualification.** Diegert, K.V.; Easterling, R.G.; Ashby, M.R.; Benavides, G.L.; Forsythe, C.; Jones, R.E.; Longcope, D.B.; Parratt, S.W. Sandia National Labs., Albuquerque, NM (United States). [1995]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950394–1: 4. annual agility forum conference, Bethlehem, PA (United States), 7-9 Mar 1995). Order Number DE95006301. Source: OSTI; NTIS; GPO Dep.

The A-primed (Agile Product Realization of Innovative electro-Mechanical Devices) project is defining and proving processes for agile product realization for the Department of Energy complex. Like other agile production efforts reported in the literature, A-primed uses concurrent engineering and information automation technologies to enhance information transfer. A unique aspect of our approach to agility is the qualification during development of a family of related product designs and their production processes, rather than a single design and its attendant processes. Applying engineering principles and statistical design of experiments, economies of test and analytic effort are realized for the qualification of the device family as a whole. Thus the need is minimized for test and analysis to qualify future devices from this family, thereby further reducing the design-to-production cycle time. As a measure of the success of the A-primed approach, the first design took 24 days to produce, and operated correctly on the first attempt. A flow diagram for the qualification process is presented. Guidelines are given for implementation, based on the authors experiences as members of the A-primed qualification team.

10260 (SAND–95-8003) **Pollution prevention opportunity assessment for network operations' digital photo imagers.** Phillips, N.M. Sandia National Labs., Albuquerque, NM (United States). Feb 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95007549. Source: OSTI; NTIS; GPO Dep.

This Pollution Prevention Opportunity Assessment (PPOA) was conducted to evaluate the operations of the digital photo imagers, which are located in Building 912, Room 097B and are used by Section 8910-1, Network Operations (in Department 8910, Infrastructure and Networking Research). This PPOA documents the processes, identifies the hazardous chemical waste streams generated by these processes, recommends possible ways to minimize waste, and serves as a reference for future assessments of the digital photo imaging process.

10261 (UCRL-ID–118981) **Whirl plus tilt.** Fowler, T.K. Lawrence Livermore National Lab., CA (United States). 12 Oct 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95007948. Source: OSTI; NTIS; GPO Dep.

It is shown that, for an idealized rotor with identical magnetic bearings of negligible mass, precession and rotation are decoupled from the center-of-mass motion so that stabilization of whirl instabilities can be designed independent of tilt. The bearing torques that cause whirl also apply torques on the free-body- rotational motion in a tilted state. The rotational equations of motion including these torques are given in the paper. An approximate solution for a

special case suggests the possibility of tilt instability above a critical frequency.

10262 (WHC-SD-ER3297-TS–001-Rev.1) **Test specification for decant pump and winch assembly.** Staehr, T.W. Westinghouse Hanford Co., Richland, WA (United States). 7 Dec 1994. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005439. Source: OSTI; NTIS; INIS; GPO Dep.

This specification provides the requirements for testing of the vertical turbine decant pump including the floating suction arm with load sensing winch control, instrumentation and the associated PLC/PC control system.

10263 (WHC-SD-WM-DA–179) **Analysis of lifting beam and redesigned lifting lugs for 241-AZ-01A decant pump.** Coverdell, B.L. Westinghouse Hanford Co., Richland, WA (United States). 29 Nov 1994. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005433. Source: OSTI; NTIS; INIS; GPO Dep.

This supporting document details calculations for the proper design of a lifting beam and redesigned lifting lugs for the 241AZO1A decant pump. This design is in accordance with Standard Architectural-Civil Design Criteria, Design Loads for Facilities (DOE-RL 1989) and is safety class three. The design and fabrication is in accordance with American Institute of Steel Construction, Manual of Steel Construction, (AISC, 1989) and the Hanford Hoisting and Rigging Manual (DOE-RL 1993).

10264 (WHC-SD-WM-OTP–172) **B-Plant canyon fire foam supply.** Gainey, T. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005674. Source: OSTI; NTIS; INIS; GPO Dep.

A new raw water supply was installed for the B-Plant fire foam system. This document details tests to be performed which will demonstrate that the system can function as designed. The tests include: Verification of the operation of the automatic valves at the cells; Measurement of water flow and pressure downstream of the proportioner; Production of foam, and measurement of foam concentration. Included as an appendix is a copy of the work package resolution (J4 & J4a).

10265 (WSRC-MS–94-0629) **Anodic oxidation of tetrasodium ethylenediaminetetraacetic acid in alkaine solutions.** Pakalapati, S.N.R. (Univ. of South Carolina, Columbia, SC (United States). Dept. of Chemical Engineering); Popov, B.N.; White, R.E.; Hobbs, D.T. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950518–2: 187. meeting of the Electrochemical Society, Reno, NV (United States), 21-26 May 1995). Order Number DE95006466. Source: OSTI; NTIS; GPO Dep.

Electrochemical oxidation is being increasingly considered in recent years as a technique to destroy organic compounds in industrial waste. Johnson studied the anodic oxidation of HEDTA on platinum in acid sulfate solutions. Polarizations relationships were obtained and numerous reactions products were identified that indicated a sequential removal of acetate groups from the EDTA. The initial decarboxylation was followed by a reverse Schiff-type reaction which produced formaldehyde and the corresponding amine. The purpose of this investigation was to determine if tetrasodium ethylenediaminetetraacetic acid (Na_4EDTA) could be oxidized on platinum in alkaline solutions and to obtain information about the electrochemical reaction kinetics necessary to model the electrochemical destruction of Na_4EDTA in alkaline solutions.

10266 (ANL/ES/CP–84504) **White goods recycling in the United States: Economic and technical issues in recovering, reclaiming, and reusing nonmetallic materials.** Karvelas, D.E.; Jody, B.J.; Daniels, E.J. Argonne National Lab., IL (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941191–1: 10. international conference on solid waste management, Philadelphia, PA (United States), 13-16 Nov 1994). Order Number DE95005854. Source: OSTI; NTIS; GPO Dep.

Obsolete white goods (appliances such as refrigerators, freezers, washers, dryers, ranges, dishwashers, water heaters, dehumidifiers, and air conditioners) contain significant quantities of recyclable materials, but because of economic and environmental concerns, only limited quantities of these scrap materials are currently being recycled. Appliances are manufactured from a mix of materials, such as metals, polymers, foam, and fiberglass; metals represent more than 75% of the total weight. Appliance recycling is driven primarily by the value of the steel in the appliances. Over the last 15 years, however, the use of polymers in appliance manufacturing has increased substantially at the expense of metals. The shift in the materials composition of appliances may threaten the economics of the use of obsolete appliances as a source for scrap metals. To increase the recycling of white goods, cost-effective and environmentally acceptable technologies must be developed to separate, recover, reclaim, and reuse polymers from discarded appliances. Argonne National Laboratory is currently conducting research, with industry support, to develop cost-effective processes and methods for recovering and reclaiming acrylonitrile butadiene-styrene and High-density polystyrene from discarded appliances. This collaborative research focuses on developing a combination of mechanical/physical and chemical separation methods for recovering and reusing these high-value plastics. In addition, cost-effective methods for improving the performance characteristics of the recovered plastics are being investigated with the goal of recycling these plastics to their original application. In this paper, we examine the technical and economic issues that affect the recycling of white goods and present results of Argonne's white goods recycling research and development activities.

10267 (CONF-9408169–5) **Non-intrusive load monitoring systems: Considerations for use and potential applications.** Sharp, T.R. (Oak Ridge National Lab., TN (United States). Energy Div.). Oak Ridge National Lab., TN (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From American Council for Energy-Efficient Economy (ACEEE) summer conference; Asilomar, CA (United States); 28 Aug - 3 sep 1994. Order Number DE95006733. Source: OSTI; NTIS; GPO Dep.

The value of measured energy performance data and the desire to acquire them without the cost, complexity, and intrusiveness of standard submetering techniques have led to recent research on non-intrusive load monitoring systems. These systems offer installation simplicity and the ability to discriminate important load changes through high-resolution, higher-speed sampling at a central monitoring point such as a building's electrical service entrance. Important hardware and installation considerations learned from Oak Ridge National Laboratory's (ORNL) experience with these systems are reviewed. In addition, the ability to discern important load changes in residential and commercial buildings using these systems is discussed based on recent ORNL experiments in two buildings. Potential applications, with examples, are also discussed. Using a non-intrusive load monitoring system, an experienced user can collect valuable building power profiles that provide insight into building operations, energy use, demand, and building systems problems easily and at low cost. These systems, when available, could be valuable to DSM and energy management professionals, utilities, researchers, building management firms, energy service companies, and others.

10268 (DOE/R8/10498–T4) **System for reducing heat losses from indoor swimming pools by use of automatic covers. Technical progress report No. 4, October 1, 1994–December 31, 1994.** Lof Energy Systems, Inc., Golden, CO (United States). 15 Jan 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG48-93R810498. Order Number DE95005498. Source: OSTI; NTIS; GPO Dep.

The principal developments during the fifth quarter of the project (October - December 1994) have been as follows. (1) Design fabrication and bench testing of new 24-v controller employing automatic photocell shut-off of motor. (2) Design, fabrication and

bench testing of new 42-v controller employing automatic stop-ball and limit-switch shut-off of motor. (3) Design, fabrication, installation, operation and adjustment of prototype improved pool cover system in Denver. (4) Continued planning of installation, demonstration and evaluation of improved pool cover system at the Denver Skyland Recreation Center. (5) Improved mounting brackets. (6) Preparation of a comprehensive paper on swimming pool evaporation rates.

10269 (ENEA-RT-INN–94-06) **Hospital waste sterilization: Technical-economic comparison between radiation and microwaves treatment technologies.** Tata, A. (ENEA, Casaccia (Italy). Area Energia e Innovazione). ENEA, Casaccia (Italy). Area Energia e Innovazione. May 1994. 37p. (In Italian). (RT/INN–94-06). Order Number DE95749706. Source: OSTI; NTIS (US Sales Only).

Recent italian regulations establish that some fractions of hospital wastes, if submitted to a suitable sterilization treatment, can be assimilated to solid municipal refuses for landfilling finale disposal. Radiation technologies utilizing accelerated electrons or microwaves can be considered as the most effective and convenient techniques among emerging existing sterilization processes for hospital wastes treatment. A functional description and a technical-economic comparison of above mentioned treatments is presented, together with an up to date scenary of production and regulations of hospital wastes in Italy.

10270 (ETDE-DE–21) **Expert systems help sewage treatment plant operating staff.** Kayser, R. (Technische Univ. Braunschweig (Germany). Inst. fuer Siedlungswasserwirtschaft); Langendoerfer, H.; Hofmann, M.; Ladiges, G. Technische Univ. Braunschweig (Germany). Inst. fuer Siedlungswasserwirtschaft; Technische Univ. Braunschweig (Germany). Inst. fuer Betriebssysteme und Rechnerverbund. Feb 1992. 113p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 02WA8828. Order Number DE95746735. Source: OSTI; NTIS (US Sales Only).

Within the framework of this project, an expert system was developed to help service staff at municipal sewage water treatment plants deal with arising problems. Contrary to ordinary sewage treatment plants operated merely with a view to carbon degradation, plants destined to meet the demand for the most for reaching nutrient elimination permit only with some restriction to constantly oversee the entire processes and keep interdependences in mind. Moreover, nitrification is a relatively disturbance-prone process. The knowledge bases were set up in a way that the expert system can work in three fields: (1) supervision of nitrification by means of the ammonium effluent value, (2) supervision of the function of the ventilation control device by means of the nitrate signal and ventilator status, (3) supervision of effluent opacity by means of the opacity probe signal. When a disturbance arises, the expert system automatically starts its diagnosis and proposes suitable remedial measures. This is done using not only signals, laboratory data and calculating programmes but also, if required information provided by the staff. The causes of disturbances and suggestions for dealing with disturbances are displayed by monitor. The system has no competence of its own to intervene into processes. (orig./BBR)

10271 (FVU-FU–93-3) **Evacuated powder insulation for district heating applications.** Torstensson, H.; Zinko, H. Fjaerrvaermeutveckling FVU AB, Nykoeping (Sweden). 3 Mar 1993. 25p. Order Number DE95745002. Source: OSTI; NTIS.

The possibility to design a pipe system with a new CFC-free insulation is being investigated. The objective is to describe a pipe insulation which is as effective as the CFC-blown polyurethane foam (PUR) insulation, at comparable cost and which, at the same time, meets any environmental requirements that may be made in the foreseeable future. The thermal conductivity of vacuum-packed powder has been measured in district heating applications and a specification for a suitable packaging material has been proposed. Of the powders tested, fine-grained kieselguhr and opacified aerogel have been found to have the lowest thermal conductivities, i e 0.004 - 0.005 W/(m K) at pressures up to about 0.01 kPa, which is about a factor of 8 less than PUR. Opacified aerogel has better insulation properties than kieselguhr at pressures over about 1 kPa. A five-component plastic/aluminium laminated foil has been investigated as packaging material. An integrated insulation technique where the insulation packages are immobilized in CFC-free PUR is estimated to have considerably higher insulation capabilities than CFC-blown PUR. 9 refs. 11 figs

10272 (LUTMDN-TMVK–5243) **System Studies of District Cooling.** Bergenfeldt, K.; Sjoeberg, A. Lund Univ. (Sweden). Dept. of Heat and Power Engineering. Dec 1994. 150p. (In Swedish). Order Number DE95745003. Source: OSTI; NTIS.

Examination paper.

The report analyses how production of district cooling is affected by the choice of cooling method and refrigerant. Three different cooling methods are analyzed, i.e. the compressor, absorption, and cold air machines. Performance calculations and quality analyses are made for different types of working fluids in order to find suitable refrigerants for a heat pump and a refrigerating machine. An analysis is made of how the distribution of district cooling is affected by production method and external circumstances. Investigated distribution systems are the 3-pipe system where the district cooling system is integrated with the district heating system by using a common return line, and the 4-pipe system where the cooling and heating systems have separate return lines. The investigation shows that the compressor cooling machine gets the best results, that R 717 is the most suitable refrigerant, regarding both performance and environment, with a COP of 4.8-5.0. For heat pump applications, R 134a is best, with a COP=1.4-1.7. 31 refs, 17 figs, 11 tabs

10273 (NEI-DK–1828) **Heat pumps - technology, environment and economy. Analysis of a potential heat-pump adjustment to the Danish energy supply system.** Ramboell, Hannemann og Hoejlund A/S, Virum (Denmark); Dansk Teknologisk Inst., Taastrup (Denmark). Proevestationen for Varmepumpeanlaeg. Dec 1994. 112p. (In Danish). Contract ENS-51191-92.0049. Order Number DE95744851. Source: OSTI; NTIS.

This project aims at a general analysis of the part to be played by heat pumps in the Danish national economy. The technical-economic considerations encompass the power-driven and gas-driven heat pumps, installed in small and collective heating plants. Industrial heat pumps and animal shelter heat - based pumps are not discussed in this report. Heat pumps for individual heating systems are not expected to become cheaper, but generally an efficiency improvement up to 10 % should be possible towards the 2005. The change to 'natural' coolants should not have negative effect upon the technical development trends. The techno-economical presumptions and methodical basis for evaluation of the energy saving, environmental and socio-economic impacts are analyzed (details in the Appendix). The Danish energy policy actively encourages renewable energy source developments, and heat pumps in connection with solar and wind energy utilization are of great economic and environmental importance. More than DKr 100 mln have been invested since 1979. The air pollution abatement and CO_2 taxation policy should contribute to the intensified technical and organizational effort in the area of heat-pump utilization in district heating. (EG)

10274 (NEI-DK–1840) **Energy-economic drying and incineration of sewage sludge.** Energiministeriets Forskningsudvalg for Erhvervslivets Processer og Produkter. Stenholm, M. Dk-TEKNIK, Soeborg (Denmark). Energi og Miljoe. Dec 1994. 38p. (In Danish). Contract EM-1223/88-6. Order Number DE95744862. Source: OSTI; NTIS.

EFP-88.

There are economic, environmental and energy aspects related to elimination of sewage sludges. The conventional methods of ground disposal or spreading on agricultural areas do not utilize the organic fraction, contained in the sludge. In this project a number of energy-saving methods for drying and incineration of sewage sludge have been investigated. (EG)

10275 (NEI-DK–1846) **District heating strategy plan for Lithuania. Report A. Overview of Lithuanian district heating systems.** Danish Energy Consultants, Glostrup (Denmark). Jun 1994. 44p. Contract IMOe-768; Contract ENS-2124/59-0003. Order Number DE95755070. Source: OSTI; NTIS.

The district heating systems in Lithuania regarding organisation, technical performance and financial aspects are described. An

overview of the district heating sector, including a diagram of the total energy flow is given. The technical performance is described and evaluated briefly. The district heating boilers in Lithuania seem generally to function well, but improvements on some of the boilers should be considered. The electricity consumption of the district heating systems (mainly used for pumping and boiler fans) seems rather high, electricity could probably be saved by using new pumps with variable speed drives. Water losses from the district heating systems are far too high, and efforts should be made to locate and reduce the main leaks. Heat losses from the Lithuanian district heating networks seem not to be series, but a number of cities and areas have losses of up to 800 Gcal/km double pipe, and here improvements of the networks should be considered. The average heat consumption per m^2 floor area for non-industrial consumers in Lithuania is 2-3 times the Danish average value. This difference indicates a large savings potential. (AB)

10276 (NEI-DK–1847) **District heating strategy plan for Lithuania. Report A. Overview of Lithuanian district heating systems. Annexes.** Danish Energy Consultants, Glostrup (Denmark). Jun 1994. 78p. (In Danish). Contract IMOe-768; Contract ENS-2124/59-0003. Order Number DE95755071. Source: OSTI; NTIS.

These data sheets, which are in the form of appendices to report A of the same title, contains: INPUT DATA, which have been received from LSPS and from Mr. W. Orchard, member of the team elaborating the National Energy Strategy, KEY FIGURES, which have been calculated from the input data, and HEAT BALANCES, which are based on the input data and on information of the heat supply to industries, received from LSPS. Consumptions of gas and mazut have been calculated in Gcal by using the following calorific values: Gas: 8.00 Mcal/m^3, Mazut: 9.60 Gcal/tonne. All of the data concerns the year 1990, except length of pipelines and no. and area of buildings, which are 1992 and 1993 values, respectively. The first data sheets gives the total values for all 18 large cities together. Subsequently, data for each city are presented. (AB)

10277 (NEI-DK–1848) **District heating strategy plan for Lithuania. Report B. Proposals for rehabilitation projects for Kaunas.** Danish Energy Consultants, Glostrup (Denmark). Oct 1994. 51p. Contract IMOe-768; Contract ENS-2124/59-0003. Order Number DE95755072. Source: OSTI; NTIS.

The proposals dealt with concern various parts of the district heating system from the production of heat at the boiler houses and at the cogeneration plants in Kaunas to the consumption at apartment blocks and other large subscribers. It is recommended that installation of metering equipment at boiler houses should be given high priority. In addition to an analysis of industrial steam demand and profile in order to identify potentials for reduced steam production, an improvement of water treatment at boiler houses (Through installation of partial flow filtration, dosing equipment and use of other chemicals than the ones applied at present) to obtain a longer service life of pipesets. The coordination of the overall district heating system in Kaunas, and a number of actions aimed at increasing boiler efficiency and focusing on burners, pumps and instrumentation, insulation, cleaning and maintenance are necessary. It seems likely that energy savings are feasible at boilers of comparatively low energy efficiency in Kaunas, and at the cogeneration plant. A network analysis of the pipe system is necessary in order to prepare other investment projects such as main pump improvements and reduction of temperature level in mains. Installation of frequency converters for the pumps should be considered. Installation of meters at substations is more feasible than installation of meters at each individual apartment block. Valves should be installed for differential pressure control and also flow limiting valves at the substations in Kaunas in order to prevent situations of inadequate heat supply. Installation of new heat load control equipment in each building involves a long repay-period. General aspects of the district heating sector in Lithuania are addressed, such as changing of organizational structure and of tariffs. (AB)

10278 (NEI-DK–1849) **District heating strategy plan for Lithuania. Report B. Proposals for rehabilitation projects for Kaunas. Annexes.** Danish Energy Consultants, Glostrup (Denmark). Oct 1994. 57p. Contract IMOe-768; Contract ENS-2124/59-0003. Order Number DE95755073. Source: OSTI; NTIS.

The annexes compiled in this report comprise cash flow analyses carried out for a number of project proposals for Kaunas. The calculation method is described in Annex 1 - Design of Cash Flow Analyses. The main results of the calculations are: calculated pay-back periods, and calculated internal rates of return. Please note that in case the calculated pay-back period exceeds 20 years, the value '0.00' for pay-back period appears on the computer outprints. (au)

10279 (NEI-DK–1850) **District heating strategy plan for Lithuania. Report D. Strategy for development of the district heating sector.** Danish Energy Consultants, Glostrup (Denmark). Oct 1994. 113p. Contract IMOe-768; Contract ENS-2124/59-0003. Order Number DE95755074. Source: OSTI; NTIS.

The aim of this report is to present an overall national strategy for development of the district heating sector in Lithuania. The strategy plan should serve as a basis for decisions which have to be taken in the near future as well as giving a more general basis for the long term development of the sector. The basis for elaboration of the strategy has been discussions with the Lithuanian State Power System (LSPS) as well as Governmental decisions regarding the future development of the energy sector. Also the National Energy Strategy Study, which set up overall strategies for the energy sector in Lithuania, has been valuable. Furthermore, the viability analyses presented in Report C have given an input to the decision of which strategies should be chosen for the district heating strategy plan. As a basis for elaborating the strategy plan, some district heating problems identified during the study, are presented. During the last year, the Lithuanian Government has made a number of decisions regarding energy issues. Such as the Draft Energy Law, giving general guidelines regarding energy efficiency, energy resources, reliability and environment; specific government decisions regarding use of domestic fuel; and a programme for a national energy strategy. The full texts of these decisions are presented. The District Heating Strategy Plan comprises strategies concerning heat production, heat distribution, heat consumption and organisational aspects, accounting and tariff strategies and other general items. Detailed presentations are given in the annexes and concern combined heat and power production, requirements for a computer based operation and control system, a long term budget for LSPS, and the connection of new town quarters to the district heating networks. Guidelines for implementation of the strategy plan are given. (AB)

10280 (NUREG/CR–6289) **Reconcentration of radioactive material released to sanitary sewers in accordance with 10 CFR Part 20.** Ainsworth, C.C. (Pacific Northwest Lab., Richland, WA (United States)); Hill, R.L.; Cantrell, K.J.; Kaplan, D.I.; Norton, M.V.; Aaberg, R.L.; Stetar, E.A. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; Pacific Northwest Lab., Richland, WA (United States); Performance Technology Group, Inc., Nashville, TN (United States). Dec 1994. 260p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC06-76RL01830. (PNL–10193). Source: OSTI; NTIS; GPO; INIS.

The US Nuclear Regulatory Commission (NRC), in accordance with 10 CFR 20, and agreement states, in accordance with state regulations, regulates the discharge of radioactive materials into sanitary sewer systems. A one-year study was conducted by Pacific Northwest Laboratory (PNL) for the NRC to assess whether radioactive materials that are dischared to sanitary sewer systems undergo significant reconcentration within the wastewater treatment plants (WWTP) and to determine the physical and/or chemical processes that may result in radionuclide reconcentration within the WWTPs. The study objectives were addressed by collecting information and data on wastewater treatment, relevant geochemical processes, and individual radionuclide behavior in WWTPs from the open literature, NRC reports, EPA surveys, and interviews with NRC licensees and staff of WWTPs that may be impacted by these discharges. Radionuclide mass balance and removal efficiencies were calculated for WWTPs at Oak Ridge, TN; and Erwin, TN, but were not shown to be reliable since the licensee release data generally underestimated the mass of radionuclide that was ultimately found in the sludge. This disparity may be due, in part, to the fact that data available for use in this study were collected to address

regulatory concerns and not to perform mass balance calculations. A limited modeling study showed some promise for predicting radionuclide behavior in WWTPS, however, the general applicability of using these empirical models remains uncertain. With the data and models currently available, it is not possible to quantitatively determine the physical and chemical processes that cause reconcentration or to calculate, a priori, reconcentration factors for specific WWTP unit processes or WWTPs in general.

10281 (ORNL/CON–327) **Impacts of the Weatherization Assistance Program in fuel-oil heated houses.** Levins, W.P.; Ternes, M.P. Oak Ridge National Lab., TN (United States). Oct 1994. 305p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95005002. Source: OSTI; NTIS; GPO Dep.

In 1990, the US Department of Energy (DOE) initiated a national evaluation of its lowincome Weatherization Assistance Program. This report, which is one of five parts of that evaluation, evaluates the energy savings and cost-effectiveness of the Program as it had been applied to single-family houses heated primarily by fuel-oil. The study was based upon a representative sample (41 local weatherization agencies, 222 weatherized and 115 control houses) from the nine northeastern states during 1991 and 1992 program years. Dwelling-specific and agency-level data on measures installed, costs, and service delivery procedures were collected from the sampled agencies. Space-heating fuel-oil consumption, indoor temperature, and outdoor temperature were monitored at each house. Dwelling characteristics, air-leakage measurements, space-heating system steady-state efficiency measurements, safety inspections, and occupant questionnaires were also collected or performed at each monitored house. We estimate that the Program weatherized a total of 23,400 single-family fuel-oil heated houses in the nine northeastern states during program years 1991 and 1992. Annual fuel-oil savings were calculated using regression techniques to normalize the savings to standard weather conditions. For the northeast region, annual net fuel-oil savings averaged 160 gallons per house, or 17.7% of pre-weatherization consumption. Although indoor temperatures changed in individual houses following weatherization, there was no average change and no significant difference as compared to the control houses; thus, there was no overall indoor temperature takeback effect influencing fuel-oil savings. The weatherization work was performed cost effectively in these houses from the Program perspective, which included both installation costs and overhead and management costs but did not include non-energy benefits (such as employment and environmental).

10283 (CONF-9204102–11) **The railplug: A new ignitor for internal combustion engines.** Faidley, R.W.; Darden, M.H.; Weldon, W.F. Texas Univ., Austin, TX (United States). Center for Electromechanics. [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-91ER12115. From 6. symposium on electromagnetic launch technology; Austin, TX (United States); 28-30 Apr 1992. Order Number DE95005487. Source: OSTI; NTIS; GPO Dep.

A miniaturized railgun, termed the "railplug," has been developed for use as an ignitor of combustible mixtures in engines. The device drives a plasma armature in a multishot mode with the aim of creating a line-source for ignition rather than the point source provided by traditional spark plugs. Railplugs have been fabricated in both parallel rail and co-axial rail geometries. The railplug differs from most plasma armature railguns in two striking ways: (1) no fuse or pellet is used to initially establish the plasma (the armature is simply the arc created by a high-voltage pulse), and (2) it operates over a range of elevated pressures (up to 500 psi). Consequently, the railplug power supply must provide a high voltage spike to breakdown the gap between the rails followed by a sustaining voltage that supplies current to drive the arc down the rails. Conceptually, this is the equivalent of combining the electrostatic problem of a sparkplug with the electrodynamic one of a railgun. Two power supply options that do this are outlined, as well as details of railplug geometries. Successes to date have demonstrated the firing of plugs for over 10^4 shots at delivered arc energies of 1 J per shot. Rep rates have been demonstrated up to 50 Hz.

10284 (DOE/NASA–50306-6) **A new tribological test for candidate brush seal materials evaluation.** Fellenstein, J.A. (Ohio Aerospace Inst. Cleveland, Ohio (United States)); DellaCorte, C. National Aeronautics and Space Administration, Cleveland, OH (United States). Lewis Research Center. [1994]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI01-91CE50306. (CONF-950509–1: Annual Meeting of the Society of Tribologists and Lubricating Engineers, Chicago, IL (United States), 22-25 May 1995). Order Number DE95001412. Source: OSTI; NTIS; GPO Dep.

A new tribological test for candidate brush seal materials evaluation has been developed. The sliding contact between the brush seal wires and their mating counterface journal is simulated by testing a small tuft of wire against the outside diameter of a high speed rotating shaft. The test configuration is similar to a standard block on ring geometry. The new tester provides the capability to measure both the friction and wear of candidate wire and counterface materials under controlled loading conditions in the gram to kilogram range. A wide test condition latitude of speeds (1 to 27 m/s), temperatures (25 to 700C), and loads (0.5 to 10 N) enables the simulation of many of the important tribological parameters found in turbine engine brush seals. This paper describes the new test rig and specimen configuration and presents initial data for candidate seal materials comparing tuft test results and wear surface morphology to field tested seal components.

Forschungszentrum Juelich GmbH (Germany). Inst. fuer Werkstoffe der Energitechnik; Technische Hochschule Aachen (Germany). May 1994. 165p. (In German). Order Number DE95746496. Source: OSTI; NTIS (US Sales Only).

Dissertation submitted by Ahladas, P.

In the frame of the present disseration the suitability of a porous Coat-Mix SiC substance has been investigated with respect to the corrosion behaviour at the soot filtration and the high temperature filtration. The work is divided into the following parts: 1. Theoretical basis, 2. Overview of the literature about the passive oxidation of SiC; 3. Experimental completion (Test material, apparatus, setup); 4. Evaluation of the experiments; 5. Influence of the soot combustion on SiC. (HW)

10286 (DOE/ID/13073–1) **Final report on electric vehicle activities, September 1991–October 1994.** Del Monaco, J.L.; Pandya, D.A. Public Service Electric and Gas Co., Newark, NJ (United States). Feb 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC07-91ID13073. Order Number DE95006648. Source: OSTI; NTIS; GPO Dep.

The data and information collected for the Public Service Electric and Gas Company's (PSE&G) electric vehicle demonstration program were intended to support and enhance DOE's Electric and Hybrid Vehicle Site Operator Program. The DOE Site Operator Program is focused on the life cycle and reliability of Electric Vehicles (EVs). Of particular interest are vehicles currently available with features that are likely to be put into production or demonstrate new technology. PSE&G acquired eight GMC Electric G-Vans in 1991, and three TEVans in 1993, and conducted a program plan to test and assess the overall performance of these electric vehicles. To accomplish the objectives of DOE's Site Operator's test program, a manual data collection system was implemented. The manual data collection system has provided energy use and mileage data. From September 1991 to October 1994 PSE&G logged 69,368 miles on eleven test vehicles. PSE&G also demonstrated the EVs to diverse groups and associations at fifty seven various events. Included in the report are lessons learned concerning maintenance, operation, public reactions, and driver's acceptance of the electric vehicles.

10287 (EGG-M–94354) **Some lessons learned from the DOE site operator program.** Warren, J.F.; Helton, R.A. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9410217–2: Northeast Sustainable Energy Association (NESEA) symposium, Providence, RI (United States), 3-5 Oct 1994). Order Number DE95005042. Source: OSTI; NTIS; GPO Dep.

Performance of electric vehicles (EVs) is being studied in an ongoing Site Operator Program, as part of the Electric and Hybrid Vehicle Program supported by the U.S. Department of Energy (DOE). More than 200 EVs are being operated by Site Operators in various geographical and climatic regions of the United States. Cold-weather operation of EVs is of particular interest. As expected, low temperatures affect a battery's ability to accept a charge, which decreases EV range and increases operating costs. Battery types other than lead-acid are being evaluated such as nickel-iron, gelled electrolyte lead-acid, nickel-cadmium, and sodium-sulfur. Also, improved methods of collecting EV performance data are being implemented, thermal management systems are being tested, and a prototype ultracapacitor is being tested as a possible alternative to conventional batteries.

3306 Vehicle Design Factors

10288 (ANL/ESD/TM–79) **Computer modeling and experimental verification of figure-eight-shaped null-flux coil suspension system.** He, J.L.; Mulcahey, T.M.; Rote, D.M.; Kelly, T. Argonne National Lab., IL (United States). Dec 1994. 46p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States);Department of Transportation, Washington, DC (United States). DOE Contract W-31109-ENG-38. Agreement Contract E8691R001; Agreement Contract DTFR 53-91-X-00 Order Number DE95005694. Source: OSTI; NTIS; GPO Dep.

This report discusses the computer modeling and experimental verification of the magnetic forces associated with a figure-eight-shaped null-flux coil suspension system. A set of computer codes called COILGDWY, were developed on the basis of the dynamic circuit model and verified by means of a laboratory model. The experimental verification was conducted with a rotating PVC drum, the surface of which held various types of figure-eight-shaped null-flux coils that interacted with a stationary permanent magnet. The transient and dynamic magnetic forces between the stationary magnet and the rotating conducting coils were measured and compared with results obtained from the computer model. Good agreement between the experimental results and computer simulations was obtained. The computer model can also be used to calculate magnetic forces in a large-scale magnetic-levitation system.

10289 (KFK-PEF–125) **Electrostatically supported separation of diesel soot particles in centrifugal separators.** Wadenpohl, C. (Karlsruhe Univ. (T.H.) (Germany). Inst. fuer Mechanische Verfahrenstechnik und Mechanik); Loeffler, F.; Stahl, W. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Europaeisches Forschungszentrum fuer Massnahmen zur Luftreinhaltung (PEF). Oct 1994. 151p. (In German). Sponsored by Land Baden-Wuerttemberg, Stuttgart (Germany);Commission of the European Communities, Luxembourg (Luxembourg). Contract PEF 394002. Order Number DE95756099. Source: OSTI; NTIS (US Sales Only).

This research project deals with the separation of diesel soot particles using a two-stage separation system which consist of an electrostatic agglomerator and a cyclone. The total collection efficiencies that can be attained by the system vary between 43% and 87%, depending on the engine speed and load. The investigations of the agglomerator showed that its effectivity distinctly decays with increasing engine load. This causes a reduction of the collection efficiency by shifting the size distribution of the agglomerates towards smaller particle sizes. The forces that act on the agglomerates increase with increasing flow rates. The thus induced disagglomeration negatively influences the separation efficiency at high engine speeds. An electrocylone which has been developed during this project attained collection efficiencies between 30% and 81%. An improvement of this separator is possible by reducing the reetrainment of collected particles. (orig.)

3308 Alternative Fuels

10290 (KFB–92-72-742) **Chemical and biological characterization of exhaust emissions from two bioethanol fuels containing different diesel ignition improvers.** Westerholm, R. (Stockholm Univ., Dept. of Analytical Chemistry (Sweden)); Toernqvist, M.; Ehrenberg, L.; Rannug, U. Swedish Transport and Communications Research Board, Stockholm (Sweden). 29 Dec 1994. 76p. Order Number DE95744983. Source: OSTI; NTIS.

The report describes the results of an investigation on the potential environmental and health impacts of exhaust emissions from ethanol fuel containing two different diesel ignition improvers. Emission from these two ethanol fuels were compared with respect to their contents of regulated and unregulated exhaust components, affinity of binding the dioxin receptor and mutagenicity of compounds associated with particles and the semi-volatile phase, risk estimates of exhaust components judged to be carcinogenic. Emissions from fuel B contained smaller amounts of CO, particles, ethylene and total particle-associated PAH, but higher amounts of butadiene, than did emissions from fuel A. With respect to the other components measured, the fuels were approximately the same. In general, the emissions give similar responses in the biological tests, with, perhaps, a tendency to lower values of S9-dependent mutagenicity for fuel B. From the point of view of cancer risk, these two ignition improvers are, within the limits of uncertainty, approximately equivalent. The somewhat higher emission of butadiene from fuel B may be balanced by the lower amounts of particles and ethylene emitted from this fuel. 38 refs, 37 figs, 12 tabs

10291 (NUTEK–89-2702) **Fleet trials with 32 ethanol buses at AB Storstockholms Lokaltrafik.** Ryden, C. (Storstockholms Lokaltrafik AB, Stockholm (Sweden)). Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). 30 Dec 1993. 44p. (In Swedish). Order Number DE95744986. Source: OSTI; NTIS.

The buses have been used in regular scheduled service in the centre of Stockholm. They have had the same reliability as the diesel buses, and the maintenance costs have been comparable. The total mileage in June 1993 was 4 Mkm with an average fuel consumption of 0.9 l/km. The buses are equipped with catalytic converters of two different brands, primarily for treating the aldehydes in the exhaust. The fuel is 95 percent ethanol with an additive (Avocet) to facilitate ignition. A program for characterization and

analysis of the exhaust emissions has been conducted with good results, confirming the specifications for the second generation of ethanol engines. Costs for the ethanol fuel are higher than for regular diesel oil, 21.0 SEK/km for diesel vs 29.4 SEK/km for ethanol at the June 1993 price levels.

10292 (DOE/NN–0003) **Comprehensive Test Ban Treaty research and development FY95-96 program plan.** USDOE Office of Nonproliferation and National Security, Washington, DC (United States). Nov 1994. 58p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005149. Source: OSTI; NTIS; GPO Dep.

The Department of Energy (DOE) is responsible for the United States Government's (USG) research and development (R&D) functions for monitoring nuclear explosions in the context of a Comprehensive Test Ban Treaty (CTBT). This responsibility includes the November 1993 transfer of the Department of Defense's (DoD) CTBT R&D responsibility to DOE. The DOE research program builds on the broad base of USG expertise developed historically and includes R&D for detecting, locating, identifying, and characterizing nuclear explosions in all environments. The Office of Research and Development (NN-20), within the Department of Energy's Office of Nonproliferation and National Security, formulates and executes the efforts necessary to meet the Department's responsibilities. The following DOE laboratories as a team will support NN-20 in implementing the program plan: Lawrence Livermore National Laboratory, Los Alamos National Laboratory, Pacific Northwest Laboratory, and Sandia National Laboratories. DOE has committed to a cooperative program that draws upon the core competencies of the national laboratories and upon the strengths of other government agencies and the private sector (academia and industry). The integration of resources under a common direction will allow the program to be flexible and responsive to changing technical and policy requirements while maximizing the effectiveness of funding appropriations. DOE will develop and demonstrate appropriate technologies, algorithms, procedures, and integrated systems in a cost-effective and timely manner. The program comprises seismic, radionuclide, hydroacoustic, and infrasound monitoring; on-site inspection; space-based monitoring; and automated data processing elements.

This talk is about how to avoid turning swords into Superfund sites. The problem we address is the potential conflict between the desire to take advantage of the greater international security brought by the end of the Cold War by entering arms control agreements requiring various military weapons to be dismantled, and the desire to avoid further degrading the environment in the process of destroying them. We will use as an illustration of these issues the Chemical Weapons Convention (CWC), which is intended to cause the destruction of all chemical weapons in the world. First, we will provide a brief overview of the CWC, then we will focus in on its environmental provisions, and, finally, we will discuss potential conflicts with United States law and how they might be resolved.

Specialized agencies of the United Nations are a part of the functioning of the existing world order. Those agencies which verify compliance with specific international treaties will be more important in the future. Two such agencies illustrate UN activities in the area of disarmament and have received special attention: the International Atomic Energy Agency (IAEA) in Vienna, Austria; the Organization for the Prohibition of Chemical Weapons (OPCW) in The Hague, Holland.

The European Union has published the attached statement, dated 8 December 1994, on the accession of Ukraine to the Treaty on the Non-Proliferation of Nuclear Weapons. The statement is being circulated to all Member States at the request of the Resident Representative of the Federal Republic of Germany on behalf of the European Union.

10297 (LA-UR–95-101) **Rethinking the NPT.** Pilat, J.F. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006298. Source: OSTI; NTIS; INIS; GPO Dep.

The Treaty on the Nonproliferation of Nuclear Weapons (NPT), with over 160 parties, is the most widely adhered to arms control treaty in history, but it has been criticized throughout its existence. In 1995, it is confronting a fateful decision on its extension and its application to today's world. In many ways it it unfortunate that fundamental questions about the treaty and its role in the post-Cold War world are not being addressed. The environment in which the NPT emerged and flourished has changed fundamentally, including the collapse of one of the founding members, the USSR. Iraq, Iran, and North Korea weapon development programs have raised important questions about its effectiveness. Also, the NPT, with its discrimination between nuclear weapon states (NWSs) and nonnuclear weapon states (NNWSs), is now being questioned and alternatives such as a revival of the Baruch Plan are being put forward, moreover, the NPT has not been the chosen international policy path for dealing with chemical and biological weapons. The paper outlines the history of international policy on nuclear weapons and their proliferation from the 1940's to today. If the NPT does survive in 1995, can it be strengthened? The full range of issues on NPTs extension will be debated endlessly, but vigilance is necessary, the treaty will have to be tended over time or it will wither and die.

10298 (GAO/NSIAD/RCED–93-284) **Nuclear nonproliferation and safety: Challenges facing the International Atomic Energy Agency.** General Accounting Office, Washington, DC (United States). Sep 1993. 77p. Sponsored by General Accounting Office, Washington, DC (United States). Source: OSTI; U.S. General Accounting Office, P.O. Box 6015, Gaithersburg, MD 20884-6015 (United States).

The Chairman of the Senate Committee on Governmental Affairs asked the United States General Accounting Office (GAO) to review the safeguards and nuclear power plant safety programs of the International Atomic Energy Agency (IAEA). This report examines (1) the effectiveness of IAEA's safeguards program and the adequacy of program funding, (2) the management of U.S. technical assistance to the IAEA's safeguards program, and (3) the effectiveness of IAEA's program for advising United Nations (UN) member states about nuclear power plant safety and the adequacy of program funding. Under its statute and the Treaty on the Non-Proliferation of Nuclear Weapons, IAEA is mandated to administer safeguards to detect diversions of significant quantities of nuclear material from peaceful uses. Because of limits on budget growth and unpaid contributions, IAEA has had difficulty funding the safeguards program. IAEA also conducts inspections of facilities or locations containing declared nuclear material, and manages a program for reviewing the operational safety of designated nuclear power plants. The U.S. technical assistance program for IAEA safeguards, overseen by an interagency coordinating committee, has enhanced the agency's inspection capabilities, however, some weaknesses still exist. Despite financial limitations, IAEA is meeting its basic safety advisory responsibilities for advising UN member states on nuclear safety and providing requested safety services. However, IAEA's program for reviewing the operational safety of nuclear power plants has not been fully effective because the program is voluntary and UN member states have not requested IAEA's review of all nuclear reactors with serious problems. GAO believes that IAEA should have more discretion in selecting reactors for review.

10301 (KFK–5334) **Karlsruhe Nuclear Research Center, Institute of Materials Research. Progress report on research and development work in 1993.** Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Materialforschung. Mar 1994. 51p. (In German). Order Number DE95754128. Source: OSTI; NTIS (US Sales Only); INIS.

The Institute consists of three parts IMF I, IMF II and IMF III. The tasks are divided into applied material physics (IMF I), material and structural mechanics (IMF II) and material process technology (IMF III). IMF I works preferably on the development of metallic, non-metallic and compound materials and on questions of the structure and properties of boundary surfaces and surface protection coatings. The main work of IMF II is the reliability of components, failure mechanics and the science of damage. IMF III examines process technology questions in the context of the manufacture of ceramic materials and fusion materials and the design of nuclear components. The Institute works on various main points of the Kernforschungszentrum in its research work, particularly in nuclear fusion, micro-system technique, nuclear safety research, superconductivity and in processes with little harmful substances and waste. Material and strength problems for future fusion reactors and fission reactors, in powerful micro systems and safety-related questions of nuclear technology are examined. Also, research not bound to projects in the field of metallic, ceramic and polymer materials for high stresses is carried out. (orig.)

This investigation was sponsored by the Los Alamos National Laboratory in an effort to understand better the phenomenon of stress assisted diffusion in cracked structures operating in corrosive environments. Work done on the extension of the existing "Coupled Thermomechanical Diffusion" theory to enable the prediction of diffusion of a solute species in stressed solids in the presence of cracks is presented here. Mathematical formalism is provided to support the intuitive notion that a singular solution for the concentration field can exist in crack tip neighborhoods driven by singular solutions for stresses that have been obtained within the framework of classical Linear Elastic Fracture Mechanics. It has been shown that under certain limiting assumptions, a singular solution for the concentration profile of the kind $1/\sqrt{r}$ emerges from the governing equations. Both steady state and transient solutions were obtained. A numerical simulation using quarter point finite elements was carried out and the results obtained also indicated the presence of this singularity. A singular solution for the concentration profiles of diffusing species in crack tip neighborhoods was obtained by Gdoutos and Aifantis. The order of the singularity obtained in their investigation was different from that discovered in the present work as were the governing differential equations and the underlying assumptions of their model. In order to determine the reasons for the differences, a detailed study was undertaken comparing the two theories and their underlying assumptions, methodology and results. These comparisons also form part of the present work.

10304 (ANL/MSD/CP–83327) **Surface energy driven crystallization of amorphous $Ni_{69}Cr_{14}P_{17}$ alloy.** Schumacher, G. (Argonne National Lab., IL (United States)); Wanderka, N.; Wahi, R.P. Argonne National Lab., IL (United States). Nov 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941144–55: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95005543. Source: OSTI; NTIS; GPO Dep.

Amorphous $Ni_{69}Cr_{14}P_{17}$ specimens thinned for transmission electron microscopy have been studied in situ during thermal treatment. In the thinnest regions of the specimens (thickness d < 50 nm), a metastable hexagonal $(Ni,Cr)_3P$ phase nucleates at the perforation edge with the c-axis perpendicular to the specimen surface. The crystal width of this phase grows linearly with time. Above 530°C the hexagonal phase transforms into a stable b.c.t. $(Ni,Cr)_3P$ phase. It is concluded that the surface and grain boundary energies dominate nucleation and growth.

10305 (ANL/MSD/CP–85324) **Magnetic and structural properties of Fe/Pd multilayers studied by magnetic x-ray dichroism and x-ray absorption spectroscopy.** Mini, S.M. (Centre Universitaire Paris-Sud, Orsay (France). Laboratoire pour l'Utilisation du Rayonnement Electromagnetique (LURE)); Fullerton, E.E.; Sowers, C.H.; Fontaine, A.; Pizzini, S.; Bommannavar, A.S. Argonne National Lab., IL (United States). Dec 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941144–63: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95007095. Source: OSTI; NTIS; INIS; GPO Dep.

The results of magnetic circular x-ray dichroism (MCXD) measurements and extended x-ray absorption fine structure measurements (EXAFS) of the Fe K-edges of textured Fe(110)/Pd(111) multilayers are reported. The EXAFS results indicates that the iron in the system goes from bcc to a more densely packed system as the thickness of the iron layer is decreased. The magnetic properties were measured by SQUID magnetometry from 5-350 K. For all the samples, the saturation magnetization was significantly enhanced over the bulk values indicating the interface Pd atoms are polarized by the Fe layer. The enhancement corresponds to a moment of $\approx 2.5 \mu_B$ per interface Pd atom.

From International conference on ultrahigh purity metals; Sendai (Japan); 23-27 May 1994. Order Number DE95007378. Source: OSTI; NTIS; GPO Dep.

In this paper the brittleness of grain boundaries in Ni_3Al is discussed with special emphasis on the effects of B. The effects of alloy stoichiometry, environment (hydrogen), grain boundary character and B levels are described and interpreted in terms of current theories. It is shown that the grain boundaries in Ni_3Al are intrinsically weaker than the bulk (the weakness is not an impurity effect), the weakness is exacerbated by atmospheric moisture, and that B in the boundaries both increases the intrinsic strength of the boundaries and reduces the deleterious effects of atmospheric moisture. Only low angle boundaries and twin boundaries are intrinsically strong in Ni_3Al, even in the absence of B.

10307 (CONF-9408150–3) **Resonant coherent excitation of N^{6+} and Mg^{11+} in planar channeling: Anisotropies in ionization probabilities and x-ray emission.** Datz, S. (Oak Ridge National Lab., TN (United States). Physics Div.); Dittner, P.F.; Krause, H.F.; Vane, C.R.; Crawford, O.H.; Forster, J.S.; Ball, G.S.; Davies, W.G.; Geiger, J.S. Oak Ridge National Lab., TN (United States). [1994]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 10. international workshop of inelastic ion-surface collisions; Grand Targhee Resort, WY (United States); 8-12 Aug 1994. Order Number DE95006732. Source: OSTI; NTIS; INIS; GPO Dep.

The thrust of the conference in which this paper is presented is toward inelastic interactions of ions with surfaces. The work described in this paper deals with inelastic interactions of ions in planar channeling inside the crystal. The authors are, however, not too far off the mark because the planar channeling potential is made up from the sum of two (sheet) surface potentials. For the nitrogen experiment, a beam of N^{6+} ions at an energy of 3.25 MeV/amu was supplied by the ORNL EN Tandem accelerator. After suitable collimation, it was passed through an Au crystal (1,800 Å thick). The emergent charge-state distribution was analyzed by electrostatic deflection followed by a solid-state position-sensitive detector. Charge states 5, 6 and 7 were simultaneously detected. In the case of Mg^{11+} the beam was supplied at an energy of 25 MeV/amu by the CSCC Tandem Cyclotron Facility at Chalk River, Canada, and passed through an Ni crystal 4,000 Å thick which was epitaxially grown with the surface parallel to a (100) plane. The beam was charge state analyzed by a Q3D magnetic analyzer in which charges 11+ and 12+ were registered. At the energy in question, almost no 10+ fraction is visible. Two Si(Li) X-ray detectors aimed at 90° and 45° recorded the emission of Mg^{11+} Lyα (n = 2 → 1) X-rays. In conclusion, there is strong evidence that once a given ionic state is excited, a large fraction of the ions remain in that state and are either ionized or radiate from that state. The result is counter to the expectation that electron-ion collisions in the channel would have a large enough cross section to destroy the alignment before either of these two events could take place. At this point, the reasons for the observed retention of anisotropy are open to conjecture.

10308 (CONF-941016–3) **Oxidation of ion-implanted NiAl.** Hanrahan, R.J. Jr. (Florida Univ., Gainesville, FL (United States). Dept. of Materials Science and Engineering); Verink, E.D. Jr.; Withrow, S.P. Oak Ridge National Lab., TN (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Materials week '94; Rosemont, IL (United States); 3-7 Oct 1994. Order Number DE95005899. Source: OSTI; NTIS; GPO Dep.

The oxidation of NiAl is complicated by the formation of transient alumina phases which result in convoluted scales which are prone to spallation. We have investigated high-dose implantation of oxygen as a technique for forming a protective oxide layer on the surface of NiAl and thereby bypassing the conditions that lead to transient oxide formation. Single crystal specimens of high purity NiAl were implanted with 1×10^{18} ^{18}O ions/cm^2 at 160 keV. Implanted specimens were annealed for times ranging from 5 to 60 minutes in a reducing atmosphere. Oxidation experiments were conducted for periods ranging from 1 hour to 42 hours under both cyclic and isothermal conditions. Specimens in the as-implanted, annealed, and oxidized conditions were examined using Auger electron microscopy. Oxygen implantation followed by annealing was found to form an epitaxial oxide layer. This layer is stable for the duration of the oxidation experiments conducted in this study, and was found to result in reduced oxidation and improved resistance to scale spallation.

10309 (CONF-9410213–4) **Processing and properties of iridium alloys for space power applications.** Ohriner, E.K. Oak Ridge National Lab., TN (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1994 international conference on tungsten and refractory metals; McLean, VA (United States); 17-19 Oct 1994. Order Number DE95005902. Source: OSTI; NTIS; GPO Dep.

Iridium alloys are used as fuel cladding in radioisotope thermoelectric generators due to their high-melting point, high- temperature strength, and oxidation and corrosion resistance. Although iridium has a face-centered cubic crystal structure, it undergoes a distinct ductile-to-brittle transition characteristic of many body-centered cubic metals. Improved ductility in the alloys is achieved through material purification and controlled alloy additions at the parts per million (ppm) level. A vacuum arc remelt operation produces a nearly defect-free casting, which is further processed to sheet products. A change in processing from drop castings of small arc-melted buttons to large arc-remelted ingots has substantially improved product yields. The effects of processing changes

on alloy microstructure, sheet textures, oxidation effects, high-strain-rate ductility, and fabricability are discussed.

10310 (CONF-9410296–1) **Advances in welding science - a perspective.** David, S.A. (Oak Ridge National Lab., TN (United States)); Vitek, J.M.; Babu, S.S.; DebRoy, T. Oak Ridge National Lab., TN (United States). [1995]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Welding Technology Institute of Australia (WTIA) annual conference; Melbourne (Australia); 24-27 Oct 1994. Order Number DE95006745. Source: OSTI; NTIS; INIS; GPO Dep.

The ultimate goal of welding technology is to improve the joint integrity and increase productivity. Over the years, welding has been more of an art than a science, but in the last few decades major advances have taken place in welding science and technology. With the development of new methodologies at the crossroads of basic and applied sciences, enormous opportunities and potential exist to develop a science-based tailoring of composition, structure, and properties of welds with intelligent control and automation of the welding processes.

10311 (CONF-950443–1) **Non-metallic oxide inclusion formation in C-Mn low alloy steel welds.** Babu, S.S. (Pennsylvania State Univ., University Park, PA (United States)); Mundra, K.; DebRoy, T.; David, S.A.; Vitek, J.M. Oak Ridge National Lab., TN (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 76. American Welding Society (AWS) convention; Cleveland, OH (United States); 2-7 Apr 1995. Order Number DE94019160. Source: OSTI; NTIS; GPO Dep.

Inclusion characteristics influence weld metal microstructure development, especially the formation of high toughness acicular ferrite phase. Important inclusion characteristics are: size distribution, number density, volume fraction, composition. Previous work considered a sequential formation of various oxides and compounds to estimate the inclusion characteristics; however, effects of weld metal composition, nucleation and growth conditions on inclusion formation were ignored. In this work, the principles of ladle deoxidization and transformation kinetics involving nucleation and growth are used to estimate the inclusion characteristics as a function of weld metal composition and cooling conditions.

10312 (CONF-950443–2) **Atom probe field ion microscopy of Type 308 CRE stainless steel welds.** Babu, S.S. (Pennsylvania State Univ., University Park, PA (United States)); David, S.A.; Vitek, J.M.; Miller, M.K. Oak Ridge National Lab., TN (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 76. American Welding Society (AWS) convention; Cleveland, OH (United States); 2-7 Apr 1995. Order Number DE94019161. Source: OSTI; NTIS; GPO Dep.

Addition of controlled residual elements (CRE), such as 0.007 wt % B, to type 308 stainless steel welds, improved creep-rupture properties. In this paper, B distribution and microstructure development were studied. The microstructural evolution during high-temperature aging was found to similar to that of commercial SS308 welds. Atom probe analysis showed that B and C segregate to the ferrite-austenite interface. Thermodynamic calculations suggest that the segregation is due to preferential partitioning of B and C to the liquid during solidification. Further work is needed to study B redistribution in aging stages.

10313 (DOE/ER/45388–T3) **Simulations of metal dissolution and corrosion. Final report, January 1993-June 1994.** Searson, P.C. Johns Hopkins Univ., Baltimore, MD (United States). Dept. of Materials Science and Engineering. [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER45388. Order Number DE95007486. Source: OSTI; NTIS; GPO Dep.

There has been considerable interest in microscopic aspects of material removal processes in fields such as corrosion, erosion, evaporation, battery technology, electropolishing, and semiconductor etching. Reports of theoretical work related to many of these problems can be found in the literature although metal dissolution is a noticeable exception. Critical issues common to all dissolution reactions include the relationship between the surface morphology and the driving term (e.g. potential, concentration, temperature); the role of surface active sites, dislocations, and other heterogeneities to the dissolution kinetics; and the influence of surface diffusion We have shown that microscopic analysis of electrochemically dissolving metal surfaces via computer simulations can lead to a fundamental understanding of the relationship between surface morphology and dissolution kinetics. Microscopic information on surface processes is not contained in phenomenological equations such as the Butler-Volmer equation, which is commonly used to describe electrode dissolution. In particular, we find that the surface roughness and, consequently, the number of surface active sites, are determined by thermodynamic parameters such as the applied electrode potential. The morphology of surfaces has been shown to be an essential aspect of kinetic processes such as crystal growth and mineral dissolution. Electrochemical processes, however, are fundamentally different in that they feature the presence of very high electrical fields at the interface, which directly affect the surface reactions. To date, treatments of the kinetics of electrochemically dissolving metal surfaces have ignored surface morphology. Over the next few years, results from theoretical modeling of dissolution processes, in conjunction with new experimental techniques such as STM, are expected to provide a new insight into the processes controlling metal dissolution and corrosion.

10314 (DOE/ID/13220–T3) **Magnetically controlled deposition of metals using gas plasma. Quarterly progress report, October 1994–December 1994.** Idaho Univ., Moscow, ID (United States). [1995]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-93ID13220. Order Number DE95007248. Source: OSTI; NTIS; GPO Dep.

The objective of the grant is to develop a method of spraying materials on a substrate in a controlled manner to eliminate the waste inherent in present plating processes. The process under consideration is magnetically controlled plasma spraying. The project continues to be on schedule. The field equations have been developed and were reported in the April-June 1994 Progress Report. The equations for the external magnetic field were reported in the July-September 1994 progress report. The field equations have been cast in a format that allows solution using Finite Element (FE) techniques. The development of the computer code that will allow evaluation of the proposed technique and design of an experiment to prove the proposed process is underway.

10315 (EGG-M–94357) **Austenite and ferrite grain size evolution in plain carbon steel.** Militzer, M. (British Columbia Univ., Vancouver, BC (Canada)); Giumelli, A.; Hawbolt, E.B.; Meadowcroft, T.R. American Iron and Steel Inst., Pittsburgh, PA (United States). [1995]. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC07-93ID13205. (CONF-9410290–1: 36. mechanical working and steel processing conference, Baltimore, MD (United States), Oct 1994). Order Number DE95005016. Source: OSTI; NTIS; GPO Dep.

Grain size evolution in a 0.17%C, 0.74%Mn plain carbon steel is investigated using a Gleeble 1500 thermomechanical simulator. Austenite grain growth measurements in the temperature range from 900 to 1150°C have been used to validate the Abbruzzese and Luecke model, which is recommended for simulating grain growth during reheating. For run-out table conditions, the ferrite grain size decreases from 1μm to 4μm when the cooling rate from the austenite is increased from 1 to 80°C/s.

10316 (EGG-M–94358) **Modeling recrystallization kinetics during strip rolling.** Sun, W.P. (Univ. of British Columbia, Vancouver (Canada). The Centre for Metallurgical Process Engineering); Hawbolt, E.B.; Meadowcroft, T.R. American Iron and Steel Inst., Pittsburgh, PA (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC07-93ID13205. (CONF-9410290–2: 36. mechanical working and steel processing conference, Baltimore, MD (United States), Oct 1994). Order Number DE95005017. Source: OSTI; NTIS; GPO Dep.

In order to simulate the microstructural evolution during hot strip rolling, double-hit compression tests have been carried out on plain carbon steels. Using the softening data obtained by these tests, mathematical models were developed to predict the overall kinetics of static recrystallization under roughing and finishing mill

conditions. These models include the effects of deformation temperature, applied strain, strain rate and initial austenite grain size. Predictions based on these models are in reasonable agreement with the present experimental results.

10317 (ENEA-RT-INN–94-18) **Laser welding process simulation for ship building industry: Strategy and optimization.** Carmignani, B. (ENEA, Bologna (Italy). Centro Ricerche Energia 'E. Clementel' - Area Energia e Innovazione); Daneri, A.; Toselli, G. ENEA, Bologna (Italy). Centro Ricerche Energia 'E. Clementel' - Area Energia e Innovazione. Sep 1994. 17p. (RT/INN–94-18). Order Number DE95749697. Source: OSTI; NTIS (US Sales Only).

Feasibility studies on the simulation of the metal sheet laser welding process for the ship building industry, using the implicit version of ABAQUS code, have been made for an european EUREKA-FASP project. In this frame a strategy of approch has been set up for the evaluation of the stress and strain states induced on the sheet by the process considered. In order to reach this goal, it has been necessary to develop some "ad hoc" routines for a correct description of the laser movement and effects of the metal annealing after the melting phase due to the laser transit. The numerical approach adopted and first results obtained will be presented and discussed.

10318 (ENEA-RT-INN–94-45) **Thermal and mechanical response of steel sheets welded by laser process: Preanalysis made by ABAQUS code.** Carmignani, B. (ENEA, Bologna (Italy). Centro Ricerche Energia 'E. Clementel' - Area Energetica); Daneri, A.; Giambuzzi, S.; Toselli, G. ENEA, Bologna (Italy). Centro Ricerche Energia 'E. Clementel' - Area Energia e Innovazione. Nov 1994. 68p. (RT/INN–94-45). Order Number DE95749692. Source: OSTI; NTIS (US Sales Only).

In this work, the conclusive report on the activity, developed in the frame of the european project EUREKA-FASP (EU353), concerning the numerical simulation of the thermal and mechanical response of steel sheets, welded by a laser welding process, is presented. This type of welding process is of interest in the shipyard field. ABAQUS code, in its implicit version, has been used. Besides the description of the studies concerning more directly the laser welding, simulations of traditional welding processes, executed in order to single out particular aspects and calculation strategies to be utilized for the simulation of the process object of the study made, are presented and discussed.

10319 (GKSS–94/E/50) **Phase formation during mechanical alloying in the systems Cu-Co and Cu-Fe.** Gente, C. (GKSS-Forschungszentrum Geesthacht GmbH (Germany). Inst. fuer Werkstofforschung). GKSS-Forschungszentrum Geesthacht GmbH (Germnay); Hamburg Univ. (Germany). Fachbereich 12 - Physik. 1994. 67p. (In German). Order Number DE95755994. Source: OSTI; NTIS (US Sales Only).

To study alloy formation mechanisms upon mechanical alloying of powder blends with components exhibiting a positive heat of mixing, Cu-Co and Cu-Fe have been chosen as model systems. The phase formation is monitored by scanning electron microscopy, X-ray diffraction and calorimetric measurements. Ball milling of elemental powder blends for both systems results in the formation of fcc solid solutions. The heat release upon decomposition of the alloy agrees quantitatively with the heat of mixing, calculated by the CALPHAD method. This is regarded as a clear evidence for the formation of an extremely supersaturated solid solution, in agreement with X-ray diffraction. As a model for alloying mechanism, the formation of Cu-Co (Fe) composites consisting of coherent regions is proposed. Subsequent refinement of these regions by shearing considerably enhances the amount of enthalpy stored in phase boundaries. Supported by the gain of configurational entropy this leads to alloy formation. (orig.)

10320 (GKSS–94/E/56) **Fracture toughness properties of similar and dissimilar electron beam welds.** Kocak, M. (GKSS-Forschungszentrum Geesthacht GmbH (Germany). Inst. fuer Materialforschung); Junghans, E. GKSS-Forschungszentrum Geesthacht GmbH (Germnay). 1994. 14p. (In German). (CONF-9405291–: 2. European conference on joining technology (Eurojoin-2), Florence (Italy), 16-18 May 1994). Order Number DE95755995. Source: OSTI; NTIS (US Sales Only); INIS; Also published in: EUROJOIN-2 conference proceedings, edited by Italian Institute of Welding, Genova (Italy), 1994, p. 259-270.

The weldability aspects, tensile and Crack Tip Opening Displacement (CTOD) toughness properties of 9Cr1MoNbV (P91) martensitic steel with austenitic 316L steel were evaluated for electron beam (EB) welds on 35 mm thick pates. The effects of mechanical heterogeneity (mis-matching) at the vicinity of the crack tip of dissimilar three point bend specimens on the CTOD fracture toughness values was also discussed. The CTOD tests were performed on similar and dissimilar EB welds of austenitic and tempered martensitic P91 steels at room temperature. Dilution of austenitic with martensitic steel resulted in predominantly martensitic EB weld metal, exhibiting rather high yield strength and hardness. Nevertheless, the weld metal produced high CTOD toughness values due to the beneficial effect of the lower strength austenitic steel part of the specimen in which crack deviation occured (mis-match effect). The coarse grained HAZ of the P91 steel side exhibits extremely poor CTOD toughness properties in the as-welded condition at room temperature. The CTOD values obtained are believed to be representing the intrinsic property of this zone since the distance of the crack tip to the weaker austenitic steel part of the SENB specimens was too large to cause an effective stress relaxation at the crack tip. Further post weld heat treatment at 750 C for two hours improved the CTOD toughness marginally. (orig.)

10321 (INIS-AR–089) **A proposed phase equilibrium diagram for Pt-Zr system.** Arias, D.E.; Gribaudo, L. Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Dept. de Materiales. 1993. 10p. (In Spanish). (CONF-9310347–: 78. National meeting of the Argentine Physics Association, Rosario (Argentina), 12-15 Oct 1993). Order Number DE95620904. Source: OSTI; NTIS (US Sales Only); INIS.

Pre-conference paper.

A revision of the phase diagram of the Pt-Zr system is presented using up to date information from recent publications. The proposed change concerning the invariant transformation in the Pt-rich zone is supported by simplified thermodynamic evaluations. (author). 12 refs., 1 fig.

10323 (JAERI-Research–94-031) **High temperature low cycle fatigue of 2.25Cr-1Mo steel for the HTTR reactor vessel.** Nishi, Hiroshi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1994. 19p. (In Japanese). Order Number DE95747905. Source: OSTI; NTIS; INIS.

Low cycle fatigue tests of 2.25Cr-1Mo NT steel were performed in a vacuum at 723K to investigate the influence of strain wave on low cycle fatigue strength. Two types of strain waves, i.e., symmetrical triangular wave (fast-fast strain rate, F-F) and asymmetrical triangular wave (slow-fast strain rate, S-F) were employed, where fast and slow strain rates were 0.1%/sec and 0.001%/sec, respectively. Furthermore, fracture surface and the microstructural change were examined with scanning electron and transmission electron

microscopes. Low cycle fatigue life in S-F test was lower than that in F-F test. Fracture surfaces showed an intergranular mode with striations in the case of F-F test, while dimples were formed at MnS inclusions for S-F test. It is presumed that the formation of dimples resulted in the increase in crack growth for S-F test. The stress amplitude decreased with increasing number of cycles by cyclic softening of the steel. It was found by TEM observations that cell size of dislocation and carbide precipitates, which caused the softening, increased during the fatigue process. (author).

10324 (JAERI-Research–94-035) **Low cycle fatigue strength of diffusion bonded joints of alumina dispersion strengthened copper to 316 stainless steel.** Nishi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Hiroshi; Araki, Toshiaki. Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1994. 17p. (In Japanese). Order Number DE95747903. Source: OSTI; NTIS; INIS.

Low cycle fatigue tests were performed at room temperature for 316 stainless steel (316SS), alumina dispersion strengthened copper (DS Cu) and 316SS-DS Cu diffusion bonded joints. Plastic strain distribution of joint specimens during the fatigue was measured to estimate deformation of the joint specimens. Furthermore, microstructure of diffusion zone of the joints and fracture surface of the fatigue specimens were examined with scanning and transmission electron microscopes. The fatigue life of the joints was lower than that of DS Cu. The joint specimens fractured at the DS Cu near the interface in the case of small strain range fatigue tests. Intermetallic compounds and recrystallization were found near the interface in DS Cu. It is considered that these intermetallic compounds and recrystallization affected the low cycle fatigue strength for small strain range fatigue tests. For large strain range fatigue tests, however, fracture point was in the DS Cu 6-7mm apart from the interface, at which the maximum plastic strain occurred. It is assumed that the 316SS restrained the deformation of DS Cu near the interface for large strain range fatigue. (author).

The surface of stainless steel Cr18Ni10Ti irradiated by ^{129} Xe heavy ions in the temperature interval from 400 up to 650^0 C is studied. The fluences were changed from 10^{15} ion/cm^2 up to 2 x 10^{16} ion/cm^2. A new effect of needle structure formation with the same form was found. The height of these needles increases with the increasing of the ion fluences. The element composition of the needle structures is very different from the initial stainless steel. The phenomenological model of this phenomenon is discussed. The energy criterion when such effect will take place is introduced. (author). 9 refs., 4 figs.

10328 (Juel–2924) **Inelastic analysis of the deformation behaviour of internally cooled IN 738 LC turbine blades using the microstructural dependent constitutive equations.** Beckmoeller, S.; Schubert, F.; Penkalla, H.J.; Nickel, H.; Breitbach, G. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Werkstoffe der Energitechnik; Technische Hochschule Aachen (Germany). Jun 1994. 110p. (In German). Order Number DE95746206. Source: OSTI; NTIS (US Sales Only); INIS.

Dissertation submitted by S. Beckmoeller.

To enhance the high temperature potential of Superalloys for applications in stationary gas turbines a new concept is required for the prediction of the service life of the blades with an improved method for inelastic analysis. The applicability of the microstructural dependent constitutive equations, which has been developed at the IWE of the KFA, are discussed for a structural analysis of an internally cooled IN 738 LC turbine blade. For the multiaxial confirmation of the model tension-torsion experiments and experiments with precision casted internally cooled model turbine blades were carried out. The blades were exposed to temperature transients and tension stresses to simulate the centrifugal forces. For the mathematical analysis the constitutive equations were implemented into the Finite Elemente Code ABAQUS. A two dimensional mesh was used. At first, the temperature distribution in the blade was calculated based on the temperatures measured at certain points during the experiments. After the temperature distribution was known, it was possible to calculate the stresses and inelastic strains at every point of the model structure. The comparison of the experiments with the calculations, using the constitutive equations of Penkalla, showed a good conformity. For the life time prediction by experiments with short holding times, an elastic analysis could be used. But for experiments with long holding times creep is more dominant and has to be considered. (orig.)

10329 (Juel–2958) **Crack growth in the pm nickel-base superalloy N18 in the temperature range between 400 and 750 C under static and cyclic loading.** Weber, M.; Roedig, M.; Schubert, F.; Nickel, H. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Werkstoffe der Energitechnik; Technische Hochschule Aachen (Germany). Aug 1994. 132p. (In German). Order Number DE95745791. Source: OSTI; NTIS (US Sales Only).

Dissertation submitted by M. Weber.

Turbine discs in aircraft turbines are one of the most endangered components and high safety relevanz. By modifying the processing route and the final heat treatment, the microstructure can be optimized for an excellent damage tolerance. A good knowledge of the correlation between crack growth rate, temperature, wave form and microstructure is essentially necessary for an advanced service life concept. The new nickel-base-superalloy N18, produced on the powder metallurgical route, is a γ'-strengthened alloy with 55 (Vol.-)% γ'. To gain a better understanding between microstructure and crack growth rate, 6 different microstructures are produced with grain sizes between ASTM 10.5-ASTM 2, including versions with small and large secondary γ'-particles. Compact-Type (C(T))-specimens (to investigate the crack growth rate) were cut from extruded, from hipped material, and from forged turbine discs. The crack length was continuously monitored by using a DC potential drop technique. Test temeprature was between 400 and 750 C for fatigue crack growth, 650 and 750 C for creep and creep/fatigue crack growth. The fatigue crack growth test was tested with sinusoidal wave form at a frequency of 5 Hz. The signal form for the creep/fatigue interaction was trapezoidal with 1 second uploading, dwell time between 3 and 300 seconds to test under real conditions. To separate the influence of the atmosphare from that of

temperature, some C(T)-specimens were tested under the described conditions in vakuum. Investigations in fractography were done to separate the fracture path dependent from temperature, loading and medium. (orig.)

10330 (LA-UR–93-3814) **Plasma spraying of beryllium and beryllium-aluminum-silver alloys.** Castro, R.G. (Los Alamos National Lab., NM (United States). Materials Science and Technology Div.); Stanek, P.W.; Elliott, K.E.; Jacobson, L.A. Los Alamos National Lab., NM (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-931009–31: Fall meeting of the Minerals, Metals and Materials Society: physical metallurgy and materials, Pittsburgh, PA (United States), 17-21 Oct 1993). Order Number DE95006857. Source: OSTI; NTIS; INIS; GPO Dep.

A preliminary investigation on plasma-spraying of beryllium and a beryllium-aluminum 4% silver alloy was done at the Los Alamos National Laboratory's Beryllium Atomization and Thermal Spray Facility (BATSF). Spherical Be and Be-Al-4%Ag powders, which were produced by centrifugal atomization, were used as feedstock material for plasma-spraying. The spherical morphology of the powders allowed for better feeding of fine (<38 μm) powders into the plasma-spray torch. The difference in the as-deposited densities and deposit efficiencies of the two plasma-sprayed powders will be discussed along with the effect of processing parameters on the as-deposited microstructure of the Be-Al-4%Ag. This investigation represents ongoing research to develop and characterize plasma-spraying of beryllium and beryllium-aluminum alloys for magnetic fusion and aerospace applications.

10331 (LA-UR–94-4079) **First-principles study of intermetallic phase stability in the ternary Ti-Al-Nb alloy system.** Asta, M. (Sandia National Labs., Livermore, CA (United States)); Ormeci, A.; Wills, J.M.; Albers, R.C. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941144–46: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95005259. Source: OSTI; NTIS; GPO Dep.

The stability of bcc-based phases in the Ti-Al-Nb alloy system has been studied from first-principles using a combination of ab-initio total energy and cluster variation method (CVM) calculations. Total energies have been computed for 18 binary and ternary bcc superstructures in order to determine low temperature ordering tendencies. From the results of these calculations a set of effective cluster interaction parameters have been derived. These interaction parameters are required input for CVM computations of alloy thermodynamic properties. The CVM has been used to study the effect of composition on finite-temperature ordering tendencies and site preferences for bcc-based phases. Strong ordering tendencies are observed for binary Nb-Al and Ti-Al bcc phases as well as for ternary alloys with compositions near Ti_2AlNb. For selected superstructures we have also analyzed structural stabilities with respect to tetragonal distortions which transform the bcc into an fcc lattice. Instabilities with respect to such distortions are found to exist for binary but not ternary bcc compounds.

10332 (LA-UR–94-4218) **Atomistic studies in grain boundaries in NiAl.** Yan, M. (Los Alamos National Lab., NM (United States)); Chen, S.P.; Vitek, V. Los Alamos National Lab., NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941144–38: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95005208. Source: OSTI; NTIS; GPO Dep.

This paper presents the results of atomistic studies of grain boundaries in NiAl B2 alloy. The interatomic forces are described by Finnis-Sinclair type N-body potentials, and are fitted to properties of NiAl. The results show that the structure, energy and cohesive strength of a grain boundary depend strongly on its chemical configurations, and a grain boundary with surplus of Al is the weakest. Energies of antisite defects at the grain boundary $\Sigma 5$ (210) are also calculated, and the results suggest that Al has much larger tendency to segregate at a grain boundary than Ni does.

10333 (LA-UR–94-4246) **A study of internal damage of metal matrix composites by neutron diffraction.** Shi, N.; Bourke, M.A.M.; Goldstone, J.A. Los Alamos National Lab., NM (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941144–44: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95005157. Source: OSTI; NTIS; GPO Dep.

Using neutron diffraction, we have measured the elastic phase strains of Al/TiC and Al/SiC composites under uniaxial tensile loading. The phase strains were used to reconstruct the global elastic strain. It has been found that, above macroscopic yield, the global elastic strain response is not linear. A theoretical model shows that the nonlinearity is dictated by changes in the ratio of longitudinal phase stresses. Furthermore, the changes in this ratio resulting from matrix plasticity and reinforcement fracture are different which leads to distinct slope changes in the global elastic strain response that can be used to distinguish the onset of these two processes on the global elastic strain loading curve.

10334 (LBL–35986) **Micromagnetics and microstructure of epitaxially grown Co and Co-Cr films suitable for perpendicular magnetic recording.** Krishnan, K.M. (Lawrence Berkeley Lab., CA (United States)); Takeuchi, T.; Hirayama, Y.; Donnet, D.M.; Honda, Y.; Futamoto, M. Lawrence Berkeley Lab., CA (United States). Jul 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9410278–1: Magnetic recording conference, Tokyo (Japan), 10-14 Oct 1994). Order Number DE95004681. Source: OSTI; NTIS; INIS; GPO Dep.

Highly c-axis oriented, single crystal films of $Co_{1-x}Cr_x$ ($0 \leq x \leq 0.3$) have been grown epitaxially on mica substrates by e-beam evaporation. Films grown on Ru underlayers have an average grain size of 50–80nm, negligibe fcc content and very narrow c-axis dispersions. For Co films (x=0), the as-grown magnetization structure are mainly 180° domain walls with a uniform distribution of cross-ties for thinner samples ($\leq$ 300Å), whilst thicker (>400Å) ones show stripe domains. These images were analysed in detail to measure that wall widths and associated energy densities for as-grown, remanent and ac- magnetised samples. As expected, the magnetic properties of these films are composition dependent. However, for any Cr concentration, these films exhibit the largest saturation magnetisation when compared with either sputtered or evaporated samples. This enhancement can be attributed to a nanometer-scale segregation of Cr, which in these samples, which in these samples, could be particularly aided by the diffusion on the close-packed planes of the films with very narrow c-axis dispersions. Preliminary X-ray microanalysis and NMR data support this interpretation.

10335 (ORNL/TM–12817, pp. 545) **Hermetic inputs of power and control cables for atom energetics.** Muminov, M. (Institute of Nuclear Physics AS of Uzbekistan, Tashkent (Uzbekistan)); Mukhamedzhanov, M.; Nurmatov, Kh.; Skripnikov, Yu.; Kostyukov, N.; Minakov, N. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents the results of testing of the inputs of the power and control cables destined for atomic electric power stations including the water-water type reactor. Several ceramics and metals were used as construction materials for being radiation hard and thermally stable until temperatures of about 10000 degrees C and excluding any inflammable and thermally unstable polymers and other composites. Radiation testing of the inputs was conducted under the regimes of small and great damage. The testing of the hermetic inputs were carried out in a special chamber invented for this purpose with a Cobalt 60 gamma-source inside at the Institute of Nuclear Physics (Tashkent, Uzbekistan). The results of the testing have shown that these hermetic drivings based on metal-ceramic conjunctions maintains its working abilities after simultaneous influence of external factors.

10336 (PNL-SA–24007) **Effect of internal hydrogen on the mixed-mode I/III fracture toughness of a ferrific/martensitic**

stainless steel. Li, H. (Associated Western Universities, Richland, WA (United States)); Jones, R.H.; Gelles, D.S.; Hirth, J.P. Pacific Northwest Lab., Richland, WA (United States). Sep 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-940945–6: 5. international conference on hydrogen effects on material behavior, Moran, WY (United States), 11-15 Sep 1994). Order Number DE95005722. Source: OSTI; NTIS; GPO Dep.

The effects of H on the mixed-mode I/III critical J-integrals (J_{TC}) and tearing moduli (dJ/da) were examined for a martensitic stainless steel at ambient temperature. A H content of 4 ppm(wt) was attained after charging in a H_2 gas chamber (138 MPa) at 300°C for 2 weeks. Results showed that H decreased J_{TC} and dJ/da values compared to steel tested without H. However, the presence of H did not change the dependence of J_{TC} and dJ/da values on the crack angles. Both J_{IC} and dJ_1/da exhibited the highest relative values. The minimum values of both J_{TC} and dJ/da occurred at a crack angle between 35 and 55° [$P_{III}/(P_{III} + P_I)$ = 0.4 and 0.6]. A mechanism of the combined effect of H and mixed-mode on J_{TC} and dJ/da is discussed.

10337 (PNL-SA–24441) **Simulating the production of free defects in irradiated metals.** Heinisch, H.L. Pacific Northwest Lab., Richland, WA (United States). Jul 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-940731–4: 2. international conference on computer simulation of radiation effects, Santa Barbara, CA (United States), 24-29 Jul 1994). Order Number DE95007165. Source: OSTI; NTIS; INIS; GPO Dep.

Under cascade-producing irradiation by high energy neutrons or charged particles, only a small fraction of the initially displaced atoms contribute to the population of free defects, i.e. those that are available to migrate throughout the metal and cause microstructural changes. Although, in principle, computer simulations of free defect production could best be done using molecular dynamics, in practice, the wide ranges of time and distance scales involved can be done only by a combination of atomistic models that employ various levels of approximation. An atomic-scale, multimodel approach has been developed that combines molecular dynamics, binary collision models and stochastic annealing simulation. The annealing simulation is utilized in calibrating binary collision simulations to the results of molecular dynamics calculations, as well as to model the subsequent migration of the defects on more macroscopic time and size scales. The annealing simulation and the method of calibrating the multimodel approach are discussed, and the results of simulations of cascades in copper are presented. The temperature dependence of free defect production following simulated annealing of isolated cascades in copper shows a differential in the fractions of free vacancies and interstitial defects escaping from the cascade above Stage V. This differential, a consequence of the direct formation of interstitial clusters in cascades and the relative thermal stability of vacancy and interstitial clusters du ring subsequent annealing, is the basis for the production bias mechanism of void swelling.

10338 (PNL-SA–24801) **Recent progress in shear punch testing.** Hamilton, M.L. (Pacific Northwest Lab., Richland, WA (United States)); Toloczko, M.B.; Lucas, G.E. Pacific Northwest Lab., Richland, WA (United States). Sep 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9409286–1: International symposium on miniaturized specimens for testing of irradiated materials, Julich (Germany), 22-23 Sep 1994). Order Number DE95005962. Source: OSTI; NTIS; INIS; GPO Dep.

The shear punch test was developed in response to the needs of the materials development community for small-scale mechanical properties tests. Such tests will be of great importancé when a fusion neutron simulation device is built, since such a device is expected to have a limited irradiation volume. The shear punch test blanks a circular disk from a fixed sheet metal specimen, specifically a TEM disk. Load-displacement data generated during the test can be related to uniaxial tensile properties such as yield and ultimate strength. Shear punch and tensile tests were performed at room temperature on a number of unirradiated aluminum, copper, vanadium, and stainless steel alloys and on several irradiated aluminum alloys. Recent results discussed here suggest that the relationship between shear punch strength and tensile strength varies with alloy class, although the relationship determined for the unirradiated condition remains valid for the irradiated aluminum alloys.

10339 (PNL-SA–24864) **Radiation-induced segregation: A microchemical gauge to quantify fundamental defect parameters.** Simonen, E.P.; Bruemmer, S.M. Pacific Northwest Lab., Richland, WA (United States). Dec 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941144–50: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95005720. Source: OSTI; NTIS; INIS; GPO Dep.

Defect Kinetic are evaluated for austenitic stainless alloys by comparing model predictions to measured responses for radiation-induced grain boundary segregation. Heavy-ions, neutrons and proton irradiations having substantial statistical bases are examined. The combined modeling and measurement approach is shown to be useful for quantifying fundamental defect parameters. The mechanism evaluation indicates vacancy, migration energies of 1.15 eV or less and a vacancy formation energy at grain boundaries of 1.5 eV. Damage efficiencies of about 0.03 were established for heavy-ions and for light-water reactor neutrons. Inferred proton damage efficiencies were about 0.15. Segregation measured in an advanced gas-cooled reactor component was much greater than expected using the above parameters.

10340 (PNL-SA–25507) **Radiation-induced grain boundary segregation in austenitic stainless steels.** Bruemmer, S.M.; Charlot, L.A.; Vetrano, J.S.; Simonen, E.P. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941144–51: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95005721. Source: OSTI; NTIS; INIS; GPO Dep.

Radiation-induced segregation (RIS) to grain boundaries in Fe-Ni-Cr-Si stainless alloys has been measured as a function of irradiation temperature and dose. Heavy-ion irradiation was used to produce damage levels from 1 to 20 displacements per atom (dpa) at temperatures from 175 to 550°C. Measured Fe, Ni, and Cr segregation increased sharply with irradiation dose (from G to 5 dpa) and temperature (from 175 to about 350°C). However, grain boundary concentrations did not change significantly as dose or temperatures were further increased. Although interfacial compositions were similar, the width of radiation-induced enrichment or depletion profiles increased consistently with increasing dose or temperature. Impurity segregation (Si and P) was also measured, but only Si enrichment appeared to be radiation-induced. Grain boundary Si peaked at levels approaching 10 at% after irradiation doses to 10 dpa at an intermediate temperature of 325°C. No evidence of grain boundary silicide precipitation was detected after irradiation at any temperature. Equilibrium segregation of P was measured in the high-P alloys, but interfacial concentration did not increase with irradiation exposure. Comparisons to reported RIS in neutron-irradiated stainless steels revealed similar grain boundary compositional changes for both major alloying and impurity elements.

10341 (PNL-SA–25518) **Temperature and strain-rate effects on deformation mechanisms in irradiated stainless steel.** Brimhall, J.L.; Cole, J.I.; Vetrano, J.S.; Bruemmer, S.M. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941144–31: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95004941. Source: OSTI; NTIS; INIS; GPO Dep.

Analysis of the deformation microstructures in ion-irradiated stainless steel shows twinning to be the predominant deformation mode at room temperature. Dislocation channelling also occurs under slow strain rate conditions. Stresses required for twinning were calculated by the model of Venables and are compatible with observed yield stresses in neutron-irradiated material if loops are the

principal twin source. Computation of the expected radiation hardening from the defect structure, based on a simple model, is consistent with yield strengths measured on neutron-irradiated steels. Lower yield stresses and greater thermal energy at 288 C lessen the probability of twinning and dislocation channeling becomes the primary deformation mode at the higher temperature. However, preliminary early results show that some twinning does occur in the irradiated stainless steel even at the higher temperature when higher strain rates are used.

10342 (PNL-SA–25670) **Effects of helium pre-implantation on the microstructure and mechanical properties of irradiated 316 stainless steel.** Toloczko, M.B. (Univ. of California, Santa Barbara, CA (United States). Dept. of Chemical and Nuclear Engineering); Tedeski, G.R.; Lucas, G.E.; Odette, G.R.; Stoller, R.E.; Hamilton, M.L. Pacific Northwest Lab., Richland, WA (United States); California Univ., Santa Barbara, CA (United States). Dept. of Physics; Oak Ridge National Lab., TN (United States). Nov 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830 ; FG03-87ER52143 ; AC05-84OR21400. (CONF-941144–60: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95007162. Source: OSTI; NTIS; INIS; GPO Dep.

Transmission electron microscopy (TEM) specimens of a First Core heat of 316 stainless steel, in both the solution annealed and 20% cold worked condition, were irradiated to 46 dpa at 420 C, to 49 dpa at 520 C, and to 34 dpa at 600 C in FFTF/MOTA. Prior to irradiation, about half of the specimens were pre-implanted with approximately 100 appm of helium, and of these, several of the solution annealed and pre-implanted specimens were aged at 800 C for 2 hr. Post-irradiation density measurements showed little difference in density between the unimplanted alloys and their helium implanted counterparts. Microstructural observations on specimens irradiated at 420 C and 520 C showed relatively minor differences in defect distributions between the unimplanted and the helium implanted materials; in all cases the defect sizes and number densities were consistent with data in the literature. Where possible, irradiation hardening of the alloys was experimentally evaluated by microhardness and shear punch; experimentally obtained values were compared to values calculated using a computer model based on barrier hardening and the microstructural data. All methods indicated relatively small effects of helium implantation, and both measured and calculated values were in agreement with the range of values reported in the literature.

10343 (PTB-F–18) **Silicon for metrological uses. Lectures.** Wilkening, G. (ed.). Physikalisch-Technische Bundesanstalt, Braunschweig (Germany). Abt. Fertigungsmesstechnik. Apr 1994. 224p. (In German). (CONF-9310407–: 104. PTB seminar on silicon for metrological uses, Braunschweig (Germany), 11-12 Oct 1993). Order Number DE95746576. Source: OSTI; NTIS (US Sales Only).

This volume contains the abridged versions and overhead foils of 12 lectures read at a PTB meeting on October 11/12, 1993. The following subjects were covered: properties of silicon, radiographic analyses of monocrystalline silicon, exact determination of the abundance of isotopes in silicon, and natural variations in silicon isotope abundance, silicon analysis at PTB, silicon surfaces for scanning tunneling microscopy, preparation of large, very pure monocrystals, silicon micromechanics, preparation of quasi-ideal Si crystal surfaces, interferometric determination of the near-infrared thickness distribution of Si wafers polished on both sides, silicon wafer structural width normals, forming of silicon crystals, and silicon monocrystals as natural normals for lengths and angles. (orig.)

10344 (SAND–94-0951C) **A microstructurally based model of solder joints under conditions of thermomechanical fatigue.** Frear, D.R. (Sandia National Labs., Albuquerque, NM (United States)); Burchett, S.N.; Rashid, M.M. Sandia National Labs., Albuquerque, NM (United States). [1994]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950344–5: InterPack '95: international electronic packaging conference, Maui, HI (United States), 26-30 Mar 1995). Order Number DE95006226. Source: OSTI; NTIS; GPO Dep.

The thermomechanical fatigue failure of solder joints in increasingly becoming an important reliability issue. In this paper we present two computational methodologies that have been developed to predict the behavior of near eutectic Sn-Pb solder joints under fatigue conditions that are based on metallurgical tests as fundamental input for constitutive relations. The two-phase model mathematically predicts the heterogeneous coarsening behavior of near eutectic Sn-Pb solder. The finite element simulations from this model agree well with experimental thermomechanical fatigue tests. The simulations show that the presence of an initial heterogeneity in the solder microstructure could significantly degrade the fatigue lifetime. The single phase model is a computational technique that was developed to predict solder joint behavior using materials data for constitutive relation constants that could be determined through straightforward metallurgical experiments. A shear/torsion test sample was developed to impose strain in two different orientations. Materials constants were derived from these tests and the results showed an adequate fit to experimental results. The single-phase model could be very useful for conditions where microstructural evolution is not a dominant factor in fatigue.

10345 (SAND–94-3025C) **The unusual properties of beryllium surfaces.** Stumpf, R. (Univ. of Tennessee, Knoxville, TN (United States). Dept. of Physics and Astronomy); Hannon, J.B.; Plummer, E.W. Sandia National Labs., Albuquerque, NM (United States). [1994]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9410293–1: Workshop on electronic surfaces and interface states on metallic systems, Bad Honnef (Germany), 17-20 Oct 1994). Order Number DE95006471. Source: OSTI; INIS; NTIS; GPO Dep.

Be is a "marginal metal." The stable phase, hcp-Be, has a low Fermi-level density of states and very anisotropic structural and elastic properties, similar to a semiconductor's. At the Be(0001) surface, surface states drastically increase the Fermi-level density of states. The different nature of bonding in bulk-Be and at the Be(0001) surface explains the large outward relaxation. The presence of surface states causes large surface core-level shifts by inducing a higher electrostatic potential in the surface layers and by improving the screening at the surface. The authors experimental and theoretical investigations of atomic vibrations at the Be(0001) surface demonstrate clearly that Be screening of atomic motion by the surface states makes the surface phonon dispersion fundamentally different from that of the bulk. Properties of Be(0001) are so different from those of the bulk that the surface can be considered a new "phase" of beryllium with unique electronic and structural characteristics. For comparison they also study Be(11$\bar{2}$0), a very open surface without important surface states. Be(11$\bar{2}$0) is the only clean s-p metal surface known to reconstruct (1 x 3 missing row reconstruction).

10346 (SAND–94-8741C) **Atomistic calculations of hydrogen interactions with Ni_3Al grain boundaries and Ni/Ni_3Al interfaces.** Baskes, M.I.; Angelo, J.E.; Moody, N.R. Sandia National Labs., Albuquerque, NM (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000 ; AC04-76DR00789. (CONF-940945–7: 5. international conference on hydrogen effects on material behavior, Moran, WY (United States), 11-15 Sep 1994). Order Number DE95006497. Source: OSTI; NTIS; INIS; GPO Dep.

Embedded Atom Method (EAM) potentials have been developed for the Ni/Al/H system. The potentials have been fit to numerous properties of this system. For example, these potentials represent the structural and elastic properties of bulk Ni, Al, Ni_3Al, and NiAl quite well. In addition the potentials describe the solution and migration behavior of hydrogen in both nickel and aluminum. A number of calculations using these potentials have been performed. It is found that hydrogen strongly prefers sites in Ni_3Al that are surrounded by 6 Ni atoms. Calculations of the trapping of hydrogen to a number of grain boundaries in Ni_3Al have been performed as a function of hydrogen chemical potential at room temperature. The failure of these bicrystals under tensile stress has been examined and will be compared to the failure of pure Ni_3Al boundaries. Boundaries containing a preponderance of nickel are severely weakened by hydrogen. In order to investigate the potential embrittlement of γ/γ' alloys, trapping of hydrogen to a spherical Ni_3Al precipate in nickel as a function of chemical potential at room temperature has been calculated. It appears that the boundary is not a

strong trap for hydrogen, hence embrittlement in these alloys is not primarily due to interactions of hydrogen with the γ/γ interface.

10347 (SP–94-68) **Evaluation of crack growth data.** Svensson, Thomas; Cramer, E. Swedish National Testing and Research Inst., Boraas (Sweden). 1994. 24p. Order Number DE95744961. Source: OSTI; NTIS.

An investigation of five different methods for the evaluation of fatigue crack growth data is done with respect to their consistence, i.e. their ability to reconstruct experimental data from their resulting models. Experimental data from ten different specimens are used and the methods are investigated in connection with the Paris-Erdogan equation. The results show no significant difference between the methods and do not discriminate the use of the standardised methods (the secant method and the incremental polynomial method). 7 refs, 6 figs, 1 tab

10348 (WSRC-TR–94-0343) **Seismic evaluation of piping systems using screening criteria.** Campbell, R.D.; Landers, D.F.; Minichiello, J.C.; Slagis, G.C.; Antaki, G.A. Westinghouse Savannah River Co., Aiken, SC (United States). [1994]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-941227–1: 5. symposium on current issues related to nuclear power plant structure, equipment and piping, Orlando, FL (United States), 14-16 Dec 1994). Order Number DE95001474. Source: OSTI; NTIS; INIS; GPO Dep.

This document may be used by a qualified review team to identify potential sources of seismically induced failure in a piping system. Failure refers to the inability of a piping system to perform its expected function following an earthquake, as defined in Table 1. The screens may be used alone or with the Seismic Qualification Utility Group – Generic Implementation Procedure (SQUG-GIP), depending on the piping system's required function, listed in Table 1. Features of a piping system which do not the screening criteria are called outliers. Outliers must either be resolved through further evaluations, or be considered a potential source of seismically induced failure. Outlier evaluations, which do not necessarily require the qualification of a complete piping system by stress analysis, may be based on one or more of the following: simple calculations of pipe spans, search of the test or experience data, vendor data, industry practice, etc.

10349 (ANL/CHM/CP–85152) **The oxidation state and magnetic behaviour of Tb in high-$T_c$related materials.** Soderholm, L.; Staub, U.; Skanthakumar, S.; Antonio, M.R. Argonne National Lab., IL (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941144–59: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95007129. Source: OSTI; NTIS; INIS; GPO Dep.

L_3-X-ray absorption spectroscopy is used together with inelastic neutron scattering and magnetic susceptibility measurements to characterize the Tb oxidation state and bonding in the high-$T_c$related materials $Y_{1-x}Tb_xBa_2Cu_3O_7$ and $Pb_2Sr_2TbCu_3O_8$. The Tb is found to be essentially trivalent in both compounds with no indications of significant hybridization. However, there is evidence of significant Tb-Tb magnetic interactions in $Pb_2Sr_2TbCu_3O_8$ that persist to temperatures much higher than the Tb long-range ordering temperature.

10350 (ANL/ITD/RP–81812) **Nondestructive testing of ceramic engine components. Final progress report for completed CRADAs.** Ellingson, W.A. (Argonne National Lab., IL (United States)); Happoldt, G.P. Argonne National Lab., IL (United States). 15 Jul 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95006859. Source: OSTI; NTIS; GPO Dep.

This report describes a method for the nondestructive testing of ZrO_2 plasma-sprayed layers with intentional disbonds. A theoretical analysis was conducted to determine the surface-temperature difference for each disbond using a given input heat pulse.

10351 (ANL/MSD/CP–83324) **Sintering of textured $YBa_2Cu_3O_{7-x}$ under intensive ^{60}Co gamma irradiation.** Ibragimova, E.M. (Institute of Nuclear Physics, Tashkent (Uzbekistan)); Gasanov, E.M.; Kalanov, M.O.; Kirk, M.A.; Goretta, K.C. Argonne National Lab., IL (United States). Dec 1994. 6p. Sponsored by US-DOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941144–62: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95007098. Source: OSTI; NTIS; INIS; GPO Dep.

A study of structural and superconducting characteristics of $YBa_2Cu_3O_{7-x}$ ceramics sintered after and in the course of gamma-irradiation is reported. Using X-diffraction and SEM analyses and transport measurements, it has been shown that mainly the subsurface layer of crystallites and intergrain contacts are affected by the irradiation by means of sorption/desorption of oxygen and ordering/disordering in oxygen sublattice, which depends on gamma dose rate and dose. The irradiation provides the sintering process with an additional superthermal energy to form the orthorhombic well-ordered structure and to obtain dense ceramics possessing strong intergrain contacts and improved and stable superconducting properties.

10352 (CONF-941059–2) **Structural ceramics incorporating whiskers, platelets, and particulate phases.** Becher, P.F.; Hsueh, C.H.; Alexander, K.B.; Lin, H.T.; Warwick, W.H.; Westmoreland, C.G.; Waters, S.B. Oak Ridge National Lab., TN (United States). [1995]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 3. conference on ceramic-ceramic composites; Mons (Belgium); 18-20 Oct 1994. Order Number DE95007048. Source: OSTI; NTIS; GPO Dep.

Advances in the development of ceramics toughened with whiskers, particles or platelets are reviewed with emphasis on the development of both fracture strength and toughness. In the systems described here, the primary focus is on toughening attained by crack bridging processes (e.g., frictional bridging and pullout) in the wake of the crack tip. Examples of the influence of resultant improvements in other mechanical properties (e.g., strength, fatigue, and thermal shock resistance) are also given for whisker-reinforced aluminas. It is shown that similar increases in fracture toughness may also be brought about by the incorporation of platelet phases in ceramics, either by their addition or by their formation during densification. In addition, the development of ceramic matrix composites containing transformable tetragonal zirconia grains is discussed. Here, it is shown that both the zirconia grain size and content, combined with thermal expansion mismatch stresses, influence the transformability of the zirconia and the resultant transformation toughening effects. Examples reveal that by addressing the microstructural characteristics, as well as the reinforcement and matrix properties, high strength toughened ceramics with exceptional damage resistance can be developed.

10353 (CONF-9410283–1) **Superconductivity, magnetism and metal-insulator transitions in some ternary and pseudoternary 3d-, 4d- and 5d-metal oxides.** Johnston, D.C. (Ames Lab., IA (United States)); Borsa, F.; Kim, K.H.; Manajan, A.V.; Miller, L.L.; Torgeson, D.R.; Wang, Z.R.; Ami, T.; Crawford, M.K.; Hariow, R.L. Oak Ridge National Lab., TN (United States). [1994]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 17. international Taniguchi symposium on theoretical physics on spectroscopy of Mott Insulators and Correlated Metals; Shima (Japan); 24-29 Oct 1994. Order Number DE95005904. Source: OSTI; NTIS; INIS; GPO Dep.

Electron conduction effects have been found to be particularly important in the metallic compounds LiV_2O_4 and possibly $Sr_2Ir_{1-x}Ru_xO_4$ ($x > 0.7$), but not in metallic $Sr_{1-x}La_xVO_3$ ($x < 0.7$), and they cause the compounds Sr_2IrO_4 and ZnV_2O_4 to be (Mott-Hubbard) insulators. The LiV_2O_4 spinel compound is especially interesting, because the V ions exhibit rather clear local moment ($S = 1/2$) behavior even though the compound is a metal.

10354 (CONF-950265–1) **Formation of thallium based high temperature superconductors using aerosol flow reacted precursor powders.** Brynestad, J.; Paranthaman, M.; Goyal, A.; Heatherly, D.E.; Kroeger, D.M. Oak Ridge National Lab., TN

(United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Harold A. Oeye international symposium; Trondheim (Norway); 2-3 Feb 1995. Order Number DE95005901. Source: OSTI; NTIS; INIS; GPO Dep.

Highly anisotropic particles of various thallium containing superconductors were grown. The Tl free precursor powders with the nominal compositions $Ba_1Ca_2Cu_3Ag_{0.37}O_6$ and $Ba_2Ca_2Cu_3Ag_{0.37}O_7$ were prepared using an aerosol flow reactor. These precursor powders were post-annealed in 0.1 atm oxygen at 700°C for 4h to reduce the carbon present, and subsequently mixed with Tl_2O_3 (typical composition of Tl_x; x = 0.6 – 1.0). The Tl-containing powders were heat-treated in semi-sealed gold tubes between 650–890°C with various short and long heat-treatments. X-ray diffraction showed that the $Tl_1Ba_2Ca_1Cu_2O_7$ (referred to as Tl-1212) and $Tl_1Ba_2Ca_2Cu_3O_9$ (Tl-1223) phases formed below 700°C while $Tl_2Ba_2Ca_1Cu_2O_8$ (Tl-2212) formed between 700–830°C, and $Tl_2Ba_2Ca_2Cu_3O_{10}$ (Tl-2223) formed above 830°C. Scanning electron microscopy showed evidence for the presence of high aspect-ratio particles. These highly anisotropic particles may be of interest for the preparation of powder-in-tube and other powder-deposited conductors, for current leads, and for grain alignment studies.

10355 (CONF-9504124–1) **Thermal shock behavior of fiber-reinforced composites.** Wang, H. (Cincinnati Univ., OH (United States). Dept. of Materials Science and Engineering); Singh, R.N.; Beecher, S.C.; Dinwiddie, R.B. Oak Ridge National Lab., TN (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 96. annual meeting and exposition of the American Ceramic Society (ACerS); Indianapolis, IN (United States); 24-28 Apr 1995. Order Number DE95006746. Source: OSTI; NTIS; GPO Dep.

The thermal shock behavior of three types of continuous fiber-reinforced ceramic composites (Nextel™ or Nicalon™ fiber-reinforced chemical vapor infiltrated or polymer-derived SiC matrix composites) was studied using the water quench technique. The thermal shock induced damage was characterized by both destructive and nondestructive techniques. As compared with monolithic ceramics, the continuous fiber-reinforced ceramic composites were capable of preventing catastrophic failure caused by thermal shock and were able to retain a significant portion of their original strength at ΔT = 1000°C. The nondestructive techniques involved measuring the thermal diffusivity by the flash technique and determining the Young's modulus by the dynamic resonance method. It has been demonstrated that these nondestructive techniques can detect damage induced by thermal shock and are more sensitive in detecting damage in the early stage than the conventional destructive technique of measuring the retained strength.

10356 (DOE/ER/45405–8) **The geometry of disorder: Theoretical investigations of quasicrystals and frustrated magnets. Annual report, March 1, 1994–February, 28 1995.** Henley, C.L. Cornell Univ., Ithaca, NY (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER45405. Order Number DE95006641. Source: OSTI; NTIS; GPO Dep.

This annual report briefly discusses the findings for March 1994 to February 1995 for the theoretical investigations of quasicrystals and frustrated magnets. Random tilings, atomic structure models, and microscopic energies are briefly discussed.

10357 (ENEA-RT-INN–94-03, pp. 15-25) **Laser synthesis and microstructural characterization of ceramic nanosized powders.** Borsella, E. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Botti, S.; Giorgi, R.; Martelli, S.; Zappa, G.; Cesile, M.C.; Nesterenko, A.; Turtu, S. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Mar 1994. (CONF-9404135–Vol.1: 5. international symposium on high power lasers and applications, Vienna (Austria), 5-8 Apr 1994; RT/INN–94-03). In *Contributions to international symposium on high power lasers.* 36p. Order Number DE95749721. Source: OSTI; NTIS (US Sales Only).

CO_2 laser synthesis of ceramic powders from gas-phase precursors is an ideal method for growing nanosized, pure and nearly mono-dispersed particles. Results on the production and characterization of Si-based ultrafine powders are presented and interpreted. The microstructural properties of nanosized powders are compared with those of conventional ceramic powders. Novel applications are discussed.

10358 (ENEA-RT-INN–94-14) **Environmental attack effects on LI2ZrO3 and properties evolution as a function of the fabrication route.** Alvani, C. (ENEA, Casaccia (Italy). Area Energia e Innovazione); Mancini, M.R.; Alessandrini, F.; Casadio, S. ENEA, Casaccia (Italy). Area Energia e Innovazione. Mar 1994. 12p. (CONF-9309299–3: 2. international workshop on ceramic breeder blanket interactions, Paris (France), 22-24 Sep 1993; RT/INN–94-14). Order Number DE95749675. Source: OSTI; NTIS (US Sales Only).

The interaction of the air with Li2ZrO3 has been followed by weighting and measuring the Young Modulus by resonance acoustic technique. Storage and sintering conditions were found in order to avoid the observed mechanical degradation of the materials, that is commented on the basic of micrographical characterization, X-ray diffraction analysis and differential scanning calorimetry. The electrical properties on the mechanically stable specimens were not found to be affected by thermal cycling in environment such as inert gas with saturated water vapor, hydrogen and oxygen, but it was strongly increases by presence of CO2 and or previous storage in air.

10359 (INIS-AR–101) **Sintering of uranium dioxide obtained by continuous precipitation of AUC.** Amaya, C.D. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina). Dept. de Desarrollo de Procesos); Sterba, M.E.; Russo, D.O. Comision Nacional de Energia Atomica, San Carlos de Bariloche (Argentina). Centro Atomico Bariloche. 1993. 3p. (In Spanish). (CONF-9311167–: 21. meeting of the Argentine Association of Nuclear Technology, Mar del Plata (Argentina), 8-12 Nov 1993). Order Number DE95620950. Source: OSTI; NTIS (US Sales Only); INIS.

Pre-conference paper.

The Nuclear Materials Division in Bariloche Atomic Center evaluates the ceramic behaviour of UO_2 powders obtained from continuously precipitated and reduced AUC (Ammonium Uranyl Tri Carbonate). An analysis is made of powder characteristics (particle morphology and size distribution and specific area) on behaviour of UO_2 during sintering (compaction, sintering, pore and grain microstructure, etc.). 1 ref.

10378 (KFK–5343) **Karlsruhe Nuclear Research Center, Institute of Nuclear Solid State Physics. Progress report on research and development work in 1993.** Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Nukleare Festkoerperphysik. Mar 1994. 22p. (In German). Order Number DE95754113. Source: OSTI; NTIS (US Sales Only); INIS.

The Institute for Nuclear Solids Physics carried out about 90% of its work in the year of the report, 1993, on the main point of superconductivity. The work on high temperature superconductors on a cuprate basis was continued on a large scale. The availability of better samples (eg: non-twinned single crystals) make it possible to clear up a series of important detailed questions regarding the

structure, grid dynamics and electronic structure. The activities closely related to applications of superconducting films were concentrated on the growth of a-axis and c-axis orientated films on technically relevant substrates (above all on sapphire, including suitable buffer layers) and the examination of these films regarding their high frequency behaviour. Considerable progress was achieved in the manufacture of wafers coated on both sides. The work on Fullerene (carbon molecules C_{60}, C_{70} etc) and Fullerene compounds was continued. The Institute quickly succeeded not only in preparing these systems, but also in making a considerable contribution to a physical understanding of them. Among the Institute's activities, which are not directly connected to superconductivity (about 10%), one should mention above all, the experimental and theoretical work on the physics of surfaces and boundary surfaces, on polymer physics and on the physics of mesoscopic systems. (orig.)

10379 (KFK–5391) **Microscopic calculations of normal state properties of the high temperature superconductor $(La_{2-x}Sr_x)CuO_4$.** Rojewski, E. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Nukleare Festkoerperphysik; Karlsruhe Univ. (T.H.) (Germany). Fakultaet fuer Physik. Aug 1994. 102p. (In German). Order Number DE95754024. Source: OSTI; NTIS (US Sales Only); INIS.

The system La_2CuO_4 was treated with total energy calculations based on the density functional theory. Electronical (bandstructure), structural (lattice parameters, atomic positions) and phononical properties of this system (phonons on points of high symmetry) were calculated. In this thesis, especially many phonons without inversion symmetry were treated. This has not been possible before because of technical reasons (especially computer time). Except this, the tetragonal structure (T and T' phase) of La_2CuO_4 was examined thoroughly. The results are in good agreement with experimental values. (orig.)

10380 (LA-UR–94-4219) **Atomistic study of energy and structure of surfaces in NIO.** Yan, M.; Chen, S.P.; Voter, A.F.; Mitchell, T.E. Los Alamos National Lab., NM (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941144–41: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95005207. Source: OSTI; NTIS; GPO Dep.

The structure and energy of surfaces in NiO have been studied by atomistic calculations employing short range Buckingham potentials fitted to properties of NiO. The polarizability of lattice anions is included by using the shell model. The results show that the surface energy depends strongly on surface orientation, and the 100 surface has the lowest energy. Surfaces with higher energy prefer to reconstruct into 100 facets to lower their energy and to stabilize their structure.

10381 (LA-UR–94-4295) **Temperature-dependent growth of $LaAlO_3$ films on $YBa_2Cu_3O_7$ C-axis films for multilayer structures.** Hawley, M.E.; Houlton, R.J.; Raistrick, I.A.; Garzon, F.H. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941144–34: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95005257. Source: OSTI; NTIS; GPO Dep.

Fabrication of ultra smooth films, free of micro-shorts, is essential to the development of High Temperature Superconducting (HTS) thin film devices. One such example is a SNS junction consisting of two HTS layers separated by a uniformly smooth continuous barrier material. Other schemes under consideration require multilayer structures of up to 5 - 7 epitaxially grown layers of complex oxide material. Successful fabrication of such devices necessitates understanding the epitaxial growth of polycrystalline oxide films on polycrystalline film templates. Toward this end we have developed a set of deposition parameters that produce high quality epitaxial insulating layers suitable for HTS device applications. All films in this study were grown by off-axis RF magnetron sputter deposition. $LaAlO_3$ films were deposited over MgO grown $YBa_2Cu_3O_7$ (YBCO) c-axis thin films at temperatures ranging from 200 to 700C and on virgin substrates at 600C. Atomic Force Microscopy, eddy current measurements, and x-ray diffraction techniques were used to monitor the effect of growth conditions on the resulting film crystallinity, nanostructure, and electrical properties. Ex-situ interrupted growth characterization of these materials has yielded new insight into the processes that control the growth mechanism and resulting microstructure. All films were polycrystalline. Below 600C, $LaAlO_3$ films were not epitaxial while films grown at 650C showed some <200> orientation. The shape of the underlying YBCO film is most clearly evident for the film grown at 400C. Surface roughness depended on the appearance of crystals on the film surface. The superconducting properties of the underlying YBCO film required O_2 annealing prior to deposition of the $LaAlO_3$ layer.

10382 (LA-UR–95-677) **Aspects of macroscopic phase separation and interstitial oxygen ordering in oxygen doped $La_2CuO_{4+\delta}$.** Hammel, P.C. (Los Alamos National Lab., NM (United States)); Fisk, Z.; Statt, B.W.; Chou, F.C.; Johnston, D.C.; Cheong, S.W.; Schirber, J.E. Los Alamos National Lab., NM (United States). [1994]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-940968–1: international workshop on the anharmonic properties of high-Tc cuprates, Bled (Slovenia), 1-6 Sep 1994). Order Number DE95007864. Source: OSTI; NTIS; INIS; GPO Dep.

NMR and neutron diffraction measurements reveal that macroscopic phase separation and the tetragonal to orthorhombic (TO) structural phase coincide at two distinct points in the temperature-doping phase plot for oxygen doped $La_2CuO_{4+\delta}$. Thus the TO phase line coincides with the phase separation line. This is evidence that the macroscopic phase separation is inhibited in the tetragonal phase. We propose that the interstitial oxygen has higher mobility in the orthorhombic phase and that insufficient mobility suppresses macroscopic phase separation in the tetragonal phase. Neutron diffraction measurements also reveal superlattice peaks which indicate ordering of the interstitial oxygen. Our NMR measurements, have demonstrated a distribution of tilts of the CuO_6 octahedra. We propose a sawtooth modulation of the octahedral tilt in which the sign of the tilt changes when the tilt reaches a maximum value can explain this distribution. The large openings in the La-O layer resulting from the abrupt switch of the sign of the tilt provide an attractive location for the interstitial oxygen. This mechanism would lead to stripe ordering of the interstitial oxygen.

10383 (ORNL/Sub–85-22028/2) **Processing and characterization of transformation-toughened ceramics with strength retention to elevated temperatures. Final report.** Cutler, R.A. (Ceramatec, Inc., Salt Lake City, UT (United States)); Brinkpeter, C.B.; Vircar, A.V.; Shetty, D.K. Oak Ridge National Lab., TN (United States); Ceramatec, Inc., Salt Lake City, UT (United States). Sep 1994. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95005758. Source: OSTI; NTIS; INIS; GPO Dep.

Monolithic and three-layered Al_2O_3 – 15 vol % ZrO_2 composites were fabricated by slip casting aqueous slurries. The outer and inner layers of three-layer composites contained unstabilized and partially stabilized ZrO_2, respectively. Transformation of part of the unstabilized ZrO_2 led to surface compressive stresses in the outer layers. Strain gage, x-ray, indentation crack length, and strength measurements were used to determine the magnitude of residual stresses in the composites. The strength of the three-layer composites (≈1200 MPa) was 500–700 MPa higher than that of the monolithic outer layer composites at room temperature and 350 MPa higher at 750°C. The strength differential decreased rapidly above the m → t transformation temperature. Three-layered composites showed excellent damage resistance and improved reliability. Cam follower rollers were fabricated to demonstrate the applicability of this technique for making automotive components.

10384 (PNL-SA–25472) **The influence of surface structure on the interaction of water with TiO_2(100).** Henderson, M.A. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941144–30: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95004927. Source: OSTI; NTIS; GPO Dep.

The influence of surface structure on the interaction of water with TiO_2(100) (rutile) was investigated. Two unique surface structures of the (100) crystal face can be prepared by oxidation (the bulk-terminated surface) and by vacuum reduction (the (110)- microfaceted surface). Thermal desorption profiles, which measure of the strength of the adsorbate-surface interaction, indicate that submonolayer coverages of water are more stable on the bulk-terminated surface than on the (110)-microfaceted surface. Also, subtle differences exist in the way water interacts with 2-coordinate O^{2-} sites on these two surfaces. The implications of these results for chemistry on microcrystallines particle are considered.

10385 (PNL-SA–25545) **Temperature dependence of ion-beam-induced amorphization in β-SIC.** Weber, W.J. (Pacific Northwest Lab., Richland, WA (United States)); Wang, L.M. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950220–1: 9. international conference on ion beam modification of materials, Canberra (Australia), 5-10 Feb 1995). Order Number DE95007164. Source: OSTI; NTIS; INIS; GPO Dep.

The ion-beam-induced crystalline-to-amorphous transition in monolithic β-SIC has been studied as a function of irradiation temperature using the HVEM-Tandem Facility at Argonne National Laboratory. Specimens were irradiated with 1.5 MeV Xe^+ ions over the temperature range from 40 to 550 K, and the evolution of the amorphous state was followed in situ using the HVEM. At 40 K, the displacement dose for complete amorphization in β-SIC is 0.34 dpa and increases with temperature in two stages. The simultaneous recovery process associated with the high-temperature stage (above 100 K) has an activation energy of 0.097 $\pm$ 0.019 eV. The critical temperature above which complete amorphization does not occur is 498 K under these irradiation conditions.

10386 (PNL-SA–25554) **Characterization of collision cascade damage in $Ca_2La_8(SiO_4)_6O_2$ by HRTEM.** Weber, W.J.; Wang, L.M. Pacific Northwest Lab., Richland, WA (United States). Dec 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941144–45: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95005719. Source: OSTI; NTIS; INIS; GPO Dep.

$Ca_2La_8(SiO_4)_6O_2$ thin crystals become amorphous under ion beam irradiation. The ion dose required for complete amorphization of the thin crystal (critical amorphization dose, D_c) increased with the increasing irradiation temperature and decreased with ion mass at elevated temperatures. Samples irradiated with 1-1.5 MeV Ar^+, Kr^+ and Xe^+ ions to doses much lower than Dc, in the temperature range from 20 to 498 K were used for a detailed HRTEM study to better understand the amorphization process. The residual collision cascade damage after irradiation appeared as manometer scale amorphous domains. The images of these domains are extremely sensitive to the sample thickness. Small domains of cascade size were only found at the very thin edge of the sample. In thicker regions, amorphous domains appear after higher doses as the result of cascade overlap in projection. At higher temperatures, the observed amorphous domains are smaller indicating thermal recovery at the amorphous/crystalline interface. The amorphous domains are also larger in size after irradiation with ions of higher mass at a fixed ion dose. These results are consistent with the Dc-temperature curves determined by in situ TEM with the HVEM-Tandem Facility at Argonne National Laboratory. The width of the amorphous rim along the edge of the specimen grew with increasing ion dose suggesting that amorphization also proceeds from the sample surface. Images of the collision cascade damage were compared to the cascade sizes calculated with the TRIM code. Some digitally acquired HRTEM images of the cascade damage were processed to reveal more detailed information.

10387 (SAND–94-2145C) **High energy electron beams for ceramic joining.** Turman, B.N. (Sandia National Labs., Albuquerque, NM (United States)); Glass, S.J.; Halbleib, J.A.; Helmich, D.R.; Loehman, R.E.; Clifford, J.R. Sandia National Labs., Albuquerque, NM (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950226–4: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-10 Feb 1995). Order Number DE95006316. Source: OSTI; NTIS; GPO Dep.

Joining of structural ceramics is possible using high melting point metals such as Mo and Pt that are heated with a high energy electron beam, with the potential for high temperature joining. A 10 MeV electron beam can penetrate through 1 cm of ceramic, offering the possibility of buried interface joining. Because of transient heating and the lower heat capacity of the metal relative to the ceramic, a pulsed high power beam has the potential for melting the metal without decomposing or melting the ceramic. We have demonstrated the feasibility of the process with a series of 10 MeV, 1 kW electron beam experiments. Shear strengths up to 28 MPa have been measured. This strength is comparable to that reported in the literature for bonding silicon nitride to molybdenum with copper-silver-titanium braze, but weaker than that reported for Si_3N_4-Si_3N_4 with gold-nickel braze. The bonding mechanism appears to be a thin silicide layer.

10388 (SAND–95-0090C) **Control of thin film processing behavior through precursor structural modifications.** Schwartz, R.W. (Sandia National Labs., Albuquerque, NM (United States). Advanced Materials Lab.); Voigt, J.A.; Boyle, T.J.; Christenson, T.A.; Buchheit, C.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950129–2: 19. annual conference on advanced ceramics, materials and structures, Cocoa Beach, FL (United States), 9-12 Jan 1995). Order Number DE95006468. Source: OSTI; NTIS; GPO Dep.

In the sol-gel processing of ceramic thin films it has been frequently noted that the processing behavior, microstructure and properties of the films are dependent on the nature of the coating solution. In an attempt to understand such thin film processing-property relationships, the authors have systematically investigated the effects of varying the precursor nature on thin film densification and crystallization for ZrO_2 and TiO_2 films. Metal alkoxide starting compounds, e.g., zirconium n-butoxide-n-butanol and titanium i-propoxide, were reacted with acetic acid and 2,4-pentanedione to prepare coating solutions for thin film deposition. The use of these chelating ligands resulted in solution oligomeric species of different nature. Studies of thin film processing indicated that film processing characteristics, i.e., consolidation, densification and crystallization, were strongly dependent on solution precursor nature. Ligand steric size, pyrolysis behavior, extent of chelation, and precursor reactivity were found to be key variables in controlling film processing characteristics.

10389 (UM-P–93/74) **Comparison of lead zirconate titanate thin films on ruthenium oxide and platinum electrodes.** Bursill, L.A.; Reaney, I.M. Melbourne Univ., Parkville, VIC (Australia). School of Physics. [1994]. 17p. Sponsored by Australian Research Council, Canberra, ACT (Australia). Order Number DE95617597. Source: OSTI; NTIS (US Sales Only); INIS.

High-resolution and bright- and dark-field transmission electron microscopy are used to characterize and compare the interface structures and microstructure of PZT/RuO_2/SiO_2/Si and PZT/Pt/Ti/SiO_2/Si ferroelectric thin films, with a view to understanding the improved fatigue characteristics of PZT thin films with RuO_2 electrodes. The RuO_2/PZT interface consists of a curved pseudoperiodic minimal surface. The interface is chemically sharp with virtually no intermixing of RuO_2 and PZT, as evidenced by the atomic resolution images as well as energy dispersive X-ray analysis. A nanocrystalline pyrochlore phase Pb_2ZrTiO_{7-x} ($x \neq 1$) was found on the top surface of the PZT layer. The PZT/Pt/Ti/SiO_2/Si thin film was well-crystallized and showed sharp interfaces throughout. Possible reasons for the improved fatigue characteristics of PZT/RuO_2/SiO_2/Si thin films are discussed. 13 refs; 7 figs.

10390 (ANL/IPNS/CP–85110) **The structure of lead-indium phosphate glass.** Suzuya, K. (Argonne National Lab., IL (United States)); Price, D.L.; Loong, C.K.; Sales, B.C.; Boatner, L.A. Argonne National Lab., IL (United States). Dec 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941144–58: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95007130. Source: OSTI; NTIS; GPO Dep.

Lead-indium phosphate-lasses exhibit a number of useful properties such as a hi-h index-of-refraction, low preparation temperature and melt viscosity, and good chemical durability. The structure of such a glass (composition in wt.%: 65 PbO, 29 P_2O_5, 6 In_2O_3) has been investigated by total neutron scattering using the GLAD diffractometer at Argonne's spallation neutron source IPNS. Peaks corresponding to the P-0, Pb-O/In-O, and O-O pairs were observed in the radial distribution function. The short-range structure in the -lass, in terms of average coordination numbers and bond distances, is compared with those of a pure P_2O_5 glass and with the crystal structure of lead pyrophosphate, $Pb_2P_2O_7$. Unlike silicate glasses in which the SiO_4 tetrahedra form a 3-dimensional network, the PO_4 tetrahedra in phosphate glasses form a chain-like structure. The structural modification by the lead cations in phosphate glasses appears to occur mainly in the medium range-affecting, the lengths and connectivity of the chain-like structure.

10391 (BNL–61245) **Development of high temperature, corrosion resistant polymer concrete for use in the steam distribution system of the Consolidated Edison Company of New York. Final report.** Webster, R.P.; Kukacka, L.E.; Reams, W.; Miller, C.A. Brookhaven National Lab., Upton, NY (United States). Nov 1994. 87p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95006692. Source: OSTI; NTIS; GPO Dep.

The results of a research program conducted by Brookhaven National Laboratory (BNL) to evaluate and develop polymer concrete (PC) materials, which can be used as an alternative material of construction to conventional steel-reinforced portland cement concrete (PCC) within the steam distribution system of Consolidated Edison Company of New York (Con Ed), are presented. Three fiber-reinforced PC systems were identified and evaluated in a series of laboratory and in situ field tests. Based upon the results of these tests preliminary design studies were performed by BNL and the Con Ed Civil Design Division to determine the necessary floor slab, wall and roof thicknesses required to replace a typical steel reinforced PCC manhole with a fiber-reinforced PC manhole.

10392 (BNL–61312) **Surface crystallization and thin film melting in normal alkanes.** Wu, X.Z. (Northern Illinois Univ., DeKalb, IL (United States). Physics Dept.); Shao, H.H.; Ocko, B.M.; Deutsch, M.; Sinha, S.K. Brookhaven National Lab., Upton, NY (United States). [1994]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-941144–57: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95006694. Source: OSTI; NTIS; GPO Dep.

Normal alkanes of carbon number $n > 14$ exhibit surface crystallization at their liquid-vapor interface. This has been investigated with x-ray reflectivity, grazing incidence scattering and surface tension measurements. The structure and thermodynamics of the surface layer is consistent with a monolayer of the bulk rotator phase occurring at the surface above the bulk melting temperature. On the other hand, thin films of alkanes on SiO_2, exhibit a reduction of the melting temperature. The surface crystalline phase is observed for carbon number $n > 14$. The vanishing of surface phase for small n may be due to a transition from surface freezing to surface melting behavior. These measurements can yield the relative surface energies of the various phases. 41 refs.

10393 (CONF-920944–8) **High critical current silver-$Bi_2Sr_2CaCu_2O_{8-x}$ superconducting multilayer ribbons produced by rolling.** Whitlow, G.A. (Westinghouse Science and Technology Center, Pittsburgh, PA (United States)); Bowker, J.C.; Lovic, W.R.; List, F.A.; Kroeger, D.M. Oak Ridge National Lab., TN (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 6. annual New York State Institute on Superconductivity (NYSIS) conference on superconductivity and applications; Buffalo, NY (United States); 15-17 Sep 1992. Order Number DE95007152. Source: OSTI; NTIS; INIS; GPO Dep.

Multilayer ribbons have been fabricated from 0.004 in. thick silver strips, coated with Bi-2212 powder. After stacking and sealing in an evacuated silver box and cold-rolling to a 0.023 in. thick sandwich, very encouraging superconductive behavior has been observed. At 4.2 K such a ribbon carried critical currents of 200 A and 100 A, respectively, in fields of 0 T and 2.8 T, correspond to current density values of 4.2×10^4 A/cm^2 and 2.1×10^4A/cm^2; at 77 K the current decreased to 2.5 A in zero field. Considerable grain alignment in the superconductor was noted close to the silver sheath in ribbons with these results.

10394 (CONF-9405198–4) **Assay of weathering effects on protective polymer coatings using positron annihilation spectroscopy.** Hulett, L.D. Jr. (Oak Ridge National Lab., TN (United States)); Wallace, S.; Xu, Jun; Nielsen, B.; Szeles, Cs.; Lynn, K.G.; Pfau, J.; Schaub, A. Oak Ridge National Lab., TN (United States); Brookhaven National Lab., Upton, NY (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States);Hungarian Science Foundation (Hungary). DOE Contract AC05-84OR21400 ; AC02-76CH00016. Contract OTKA-2106/91. From 6. international workshop on slow-positron beam techniques for solids and surfaces (SLOPOS6); Makuhari (Japan); 18-22 May 1994. Order Number DE95007040. Source: OSTI; NTIS; GPO Dep.

Polymer coatings, both with and without pigments, have been subjected to solar radiation and water spray weathering. The degrees of penetration of the weathering effects have been measured by injecting positrons of varying energy, i.e. to variable depths, into the films and observing the Doppler broadening of the annihilation radiation. The method is capable of detecting changes due to weathering effects at very early stages, long before visual examination reveals degradation. As little as one week of exposure caused measurable changes in the polymer structure, which were reflected in the Doppler broadening. Given further development, positron spectroscopy could possibly become a useful complement to the other methods of determining weatherabilities of protective polymer coatings.

10395 (DOE/CE/15599–T1) **Whisker reinforced glass ceramic. Quarterly progress report No. 1, September 27, 1994–December 27, 1994.** Pickrell, G.R.; Brown, J.J. Jr. Materials Technologies of Virginia, Inc., Blacksburg, VA (United States). 12 Jan 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-94CE15599. Order Number DE95005568. Source: OSTI; NTIS; GPO Dep.

The goal of this project is to investigate the physical properties of an in-situ whisker reinforced glass ceramic material and to produce prototype heat exchanger tubes for testing in a coal combustion environment. The in-situ whisker reinforced glass ceramic process was developed and patented at Virginia Tech and licensed to Materials Technologies of Virginia. Completion of this project will demonstrate the potential for this new material to replace existing heat exchanger materials due to its superior chemical and physical properties. The technical progress has been in three areas: Construction of a slurry filtration apparatus for preparation of glass ceramic samples, construction of a prototype heat exchanger preparation apparatus, and test melts of the glass powder with parameters for composition, heat treatments, quenching, and milling.

10397 (ENEA-RT-INN–94-05) **Effects of gamma radiations in hydrogenated amorphous silicon layers.** Baccaro, S. (ENEA, Casaccia (Italy). Area Energia e Innovazione); D'Atanasio, P.;

Maiello, G.; Petti, M.; Schirone, L.; Ferrari, A. ENEA, Casaccia (Italy). Area Energia e Innovazione. May 1994. 37p. (In Italian). (RT/INN–94-05). Order Number DE95749726. Source: OSTI; NTIS (US Sales Only).

The behaviour of hydrogenated amorphous silicon layers irradiated with a gamma ray source has been studied. The total dose was in the range 5 + 100k Gy. The dark current was used to investigate the time evolution. The recovery effect of radiation damage at room temperature and by thermal annealing has been studied. The results suggest the gamma irradiation introduces dominantly Si dangling bonds: in fact activation energies calculated by time constants of recovery curve are situated like those ones of dangling bonds in the Band Gap.

Pre-conference paper.

The scope of this research is to determine the degradation of mechanical properties of cable insulating PVC after irradiation in air at a Cobalt-60 (γ-ray) facility. Amongst the mechanical properties elongation at break and tensile strength were chosen as they are the most sensible to radiation. The samples were exposed to combined radiation-thermal environments with constant airflow in order to obtain accelerated aging data a doses up to 50-300 kGy, with dose rates ranging between 1.3 and 5.6 kGy/h at temperatures from 60 degrees C to 100 degrees C. At lower dose rates the degradation of mechanical properties increased after the same total dose: elongation at break decreases sharply while tensile strength decreases to a less extent, showing dose rate effects. A strong synergy between irradiation and thermal processes was also observed. (author).

Estimation of thin film compositions and thickness by Rutherford Backscattering Spectrometer, the alpha beam energy is 2 MeV and detected by a semiconductor nuclear particle detector with 160^0 scattering angle. The film thickness is in range of 200-2500 A. The variable compositions of films show stoichiometric and non-stoichiometric compounds. Impurities are detected and including estimation of the accurate quality of dependent by 1% doping in films. A limit of this method the various elements are well separated in the spectrum, easily identified but the elements with small differ of their atomic masses cannot distinguish, and also depending on the ability of detector.

Measurement of coating thickness can be done by various techniques such as to gravimetric methods: cross-sectional measurement with microscope; beta backscattering, X-ray fluorescence (XRF) and radiation transmission techniques. In this research measurements of the coating thickness of gold on copper plates and tin on steel plates were studied by using beta backscattering and XRF techniques. A Sr^{90} annular source having the activity of 37 kBq and a GM counter were used for beta backscattering technique. For the XRF technique three annular sources were used i.e. 740 Mq-Fe^{55}, 740 MBq-Cd^{109} and 1.110 GBq-Pu238. A Xe-filled proportional counter and a high purity germanium detector were used for fluorescent X-ray measurements. The results indicated that the thickness of gold on copper and tin on steel can be measured with the error of less than 0.3 micron by the two techniques with accuracy depending on the standards used. However, the measurement of tin thickness on steel could not be done successfully because the thickness of steel plates were less than its critical thickness for Sr^{90} betas. This research has also indicated the feasibility of developing a portable instrument for rapid and accurate measurement.

Borosilicate glasses are presently the matrix accepted worldwide to solidify high-level radioactive waste from reprocessing fuel elements of nuclear power stations. The glass will experience radiation damage from alpha particles and their associated alpha-recoil atoms, from beta particles (electrons) and from gamma rays. From the viewpoint of the wasteform stability, the most serious radiation effects are expected to be phase separation, pore and/or bubble formation and micro fracturing. These types of microstructural damage may significantly increase the leachability of the primary waste-storage material. (authors). 3 figs., 7 refs.

10402 (JAERI-Research–94-023) **Joining of silicon nitride ceramics by utilizing interlayers of ultra-fine particles.** Abe, Tetsuya (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Murakami, Yoshio; Aihara, Tomoyasu; Takeuchi, Hisao; Yamakawa, Akira. Japan Atomic Energy Research Inst., Tokyo (Japan). Oct 1994. 27p. (In Japanese). Order Number DE95747888. Source: OSTI; NTIS; INIS.

Various tests have been performed to develop a ceramic-ceramic (C-C)joining method that utilizes ultra-fine particles (UFP) as the joining interlayer. The ceramic material to be joined is silicon nitride (Si_3N_4) and the interlayer material are Si_3N_4-UFP and Al_2O_3-UFP. Test samples were made by a two step process consisting of prejoining and following HIP treatment. The bending strength of the samples and the morphology of the joined parts were measured and examined. The experimental results revealed that the bending strength of the joined samples was strongly influenced by the kind of UFP material and the surface flatness of the bulk ceramics. A joined sample made of bulk Si_3N_4 rods with a surface flatness of 0.3 μm and Al_2O_3-UFP showed a bending strength of 970 MPa in a wide temperature range up to 800 degC. To demonstrate the usefulness of the new C-C joining method, two bulk Si_3N_4 pipes (outer diameter: 50mm, length: 50mm, thickness: 5mm) were joined by using Al_2O_3-UFP. The helium leak rate at the joined part was found to be less than a minimum detectable value of 10^{-9} Pa·m^3/sec (He). (author).

10409 (KFK--5379) **Phase transformations in lithium bearing sodiumborosilicate base glass melts for the solidification of HAW.** Goettlicher, J. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Schadstoff- und Abfallarme Verfahren (PSA); Muenster Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. Oct 1994. 274p. (In German). Order Number DE95755521. Source: OSTI; NTIS (US Sales Only); INIS.

Metastable phase separation has been observed in the Li-bearing basic glass SM58. This observation gave rise to examine the exsolution behaviour in model glasses by chemical substitution. It is impossible to produce metastable phase separation in the Li-free HAW-glasses VG98/12 and VG98/12.2. However, one can't exclude textural changes of Li-bearing glasses, because in a HAW-container the central temperature remains at about 300 C for more than 50 years. For the first time it has been tried to find a relationship between glass textures and structural parameters by combining textural investigations (electron microscopy) with structural determinations (NMR, WAXS). Modell glasses belong to the system (Li, $Na)_2O.B_2O_3$, $(Al_2O_3).n(TO_2)$, with T=Si, Ge and n=2, 4, 6. Furthermore glasses from the KfK and from Mol (PAMELA) were investigated. A newly built apparatus was used to prepare glasses by replica technique (PtIrC oblique shadowing) for TEM investigations. This method turned out to be well suited to study glass textures with features down to 5 nm. Sometimes direct examinations of ion-thinned glasses showed that their textures were affected by radiation damage, caused by accelerated electrons. LVSE-(Low Voltage Scanning Electron)- and AF-(Atomic Force)-microscopy seems to be a promising method for studying glass surfaces and their textures directly. (orig./MM)

10410 (LA-UR--94-4220) **Variation of solvent scattering-length density small-angle neutron scattering as a means of determining structure of composite materials.** Hjelm, R.P. (Los Alamos National Lab., NM (United States)); Wampler, W.; Gerspacher, M. Los Alamos National Lab., NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941144--40: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95005394. Source: OSTI; NTIS; INIS; GPO Dep.

As part of our work on the, structure of composite materials we have been exploring the use of small-angle neutron scattering using the method of contrast variation to dissect the component form, structure and distribution. This approach has resulted in a new look at very old problem reinforcement of elastomers by carbon black. Using this approach we studied an experimental high surface area (HSA) carbon black and a gel of "HSA-bound" rubber in cyclohexane/deuterocyclohexane mixtures. HSA in cyclohexane is found to be short rodlike particle aggregates. The aggregates have a shell-core structure with a high density graphitic outer shell and an inner core of lower density amorphous carbon. The core is continuous throughout the carbon black aggregate, making the aggregate a stiff, integral unit. Contrast variation of swollen composite gels shows that there are two length scales in the gel structure. Above 10 Å, scattering from carbon black predominates, and below 10 Å the scattering is from both carbon black and the elastomer. The HSA in the composite is completely embedded in polyisoprene. An estimate of the carbon black structure factor shows strong exclusion of neighboring aggregates, probably from excluded volume effects. The surface structure of the carbon black is unaltered by the interactions with elastomer and appears smooth over length scales above about 10 Å. These results show that contrast variation can provide information on composite structure that is not available by other means. This information relates to the reinforcement mechanism of elastomers by carbon blacks.

10411 (LA-UR--94-4364) **Ion beam mixing of titanium overlayers with hydroxyapaptite substrates.** Levine, T.E. (Cornell Univ., Ithaca, NY (United States). Dept. of Materials Science and

Engineering); Nastasi, M.; Alford, T.L.; Suchicital, C.; Russell, S.; Luptak, K.; Pizziconi, V.; Mayer, J.W. Los Alamos National Lab., NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941144–39: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95005278. Source: OSTI; NTIS; GPO Dep.

The mixing of titanium overlayers with hydroxyapatite (HA) substrates via ion irradiation has been demonstrated. Analysis via secondary ion mass spectroscopy (SIMS) indicates an interfacial broadening of titanium and calcium of the implanted sample compared to that of the unimplanted sample. Attendant to the observed ion beam mixing of titanium into the HA, the oxygen signal of the titanium overlayer increases as a result of ion irradiation. It is supposed that this change is evident of diffusion through the metal layer and possibly from titania formation at the free surface and perovskite formation at the film/substrate interface. This possibility is consistent with thermodynamic predictions. Additionally, the force required to separate the film from the substrate increased as a result of ion irradiation, validating the continued study of ion beam processing of Ti/HA systems towards the improvement of long term fixation of implant devices.

10412 (LA-UR–94-4374) **Issues related to prediction of residual stresses in titanium alloy matrix composites.** Rangaswamy, P. (Los Alamos National Lab., NM (United States)); Jayaraman, N. Los Alamos National Lab., NM (United States). [1995]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-940399–2: Life prediction methodology for titanium matrix composites symposium, Hilton Head, SC (United States), 22-24 Mar 1994). Order Number DE95005243. Source: OSTI; NTIS; GPO Dep.

Recently, a detailed study of residual stresses on the as-processed SCS-6/Ti-24Al-11Nb $[0]_8$ composite, and SCS-6/Beta-21S composites in unidirectional $[0]_4$, cross-ply [0/90]s, and quasi-isotropic $[0/\pm45/90]$s lay-ups has been completed. In this study, residual stresses have been measured using x-ray diffraction ($Sin^2\Psi$) technique. We have shown that the use of conventional unit cell models consisting of a quarter fiber surrounded by the matrix material to predict residual stresses for verification of experimental results is inadequate. Such models have successfully predicted the stresses at the fiber-matrix interface. However, experimental work to measure residual stresses have always been on surfaces far away from the interface region. In this paper, the approach taken in extending the conventional unit cell model to the concept of multi-fiber models to predict average stresses are presented. In this process, several modeling issues have been identified. These issues are (i) use of conventional unit models for prediction of average surface residual stresses, (ii) effect of orientation of the sub-surface plies on the residual stresses in the surface ply, (iii) residual stresses in the interior plies, and (iv) constituent material properties.

10413 (ORNL/TM–12664) **Thermodynamic property evaluation and magnetic refrigeration cycle analysis for gadolinium gallium garnet.** Murphy, R.W. Oak Ridge National Lab., TN (United States). Dec 1994. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95005910. Source: OSTI; NTIS; GPO Dep.

Based on relevant material property data and previous model formulations, a magnetothermodynamic property map for gadolinium gallium garnet ($Gd_3Ga_5O_{12}$) was adapted for refrigeration cycle analysis in the temperature range 4-40 K and the magnetic field range 0-6 T. Employing methods similar to those previously developed for other materials and temperature ranges, assessments of limitations and relative performance were made for Carnot, ideal regenerative, and pseudo-constant field regenerative cycles. It was found that although Carnot cycle limitations on available temperature lift for gadolinium gallium garnet are not as severe as the limitations for materials previously examined, considerable improvement in cooling capacity and temperature lift combinations can be achieved by using regenerative cycles if serious loss mechanisms are avoided.

10414 (ORNL/TM–12817, pp. 543) **A study of irradiation-induced damage in α-quartz.** Abdukadyrova, I.Kh. Oak Ridge National Lab., TN (United States). Oct 1994. (CONF-9410171–: 43. Franz-Pacher colloquium on geomechanics, Salzburg (Austria), 13-14 Oct 1994). In *Fourth conference on radiation protection and dosimetry: Proceedings, program, and abstracts.* 620p. Order Number DE94018560. Source: OSTI; NTIS; INIS; GPO Dep.

Samples of crystalline synthetic quartz were exposed in a reactor to fast neutrons with a fluence ranging from 10^{18} to 10^{21} neutron/cm^2. They were wrapped in aluminum foil and quartzous ampules. The temperatures of the samples are estimated to have been about 60 degrees C. As a result of the high-doses fast neutron bombardment, monocrystalline alpha-quartz had transformed into the amorphous phase. This process of radiation damage of crystalline structure by optical, mechanical, and roentgenographic methods has been studies. The possibility of the utilization of the structurally sensitive properties of alpha-quartz in neutron-irradiation dosimetry was discovered. The mechanical and optical properties of crystal quartz irradiated by neutrons are investigated. The influence of dose on the radiation expansion along and perpendicular to the C-axis and on the density of samples is studied. A comparison is made with the properties of the samples before irradiation.

10415 (PNL-SA–22141) **Pressure-temperature sensors: Solution deposition of rare earth doped garnet films.** Hess, N.J.; Exarhos, G.J. Pacific Northwest Lab., Richland, WA (United States). Nov 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-931142–8: 1. meeting of the Pacific Rim ceramic societies, Honolulu, HI (United States), 7-10 Nov 1993). Order Number DE95004933. Source: OSTI; NTIS; GPO Dep.

An aqueous route to the deposition of multicomponent metal oxide films is based upon the complexation of precursor metal nitrate salts by glycine, or other organic complexant, followed by spin-coating the homogeneous solution onto pretreated silica substrates. Glycine serves to frustrate the formation of cation oxides, thus precipitation. Upon dehydration, a glassy matrix results through which metal cations and nitrate anions are homogeneously dispersed. Subsequent heating of coated substrates initiates an oxidation-reduction reaction, which removes the organic matrix and residual nitrate leaving behind a film of the desired oxide composition. Using this method, SM:YAG (Sm:$Y_3Al_5O_{12}$ - garnet) films about 150 nm thick have been deposited. The respective phases have been confirmed by powder XRD measurements and fluorescence spectroscopy. Analogous studies using powders generated by the same technique provided the parameters for optimizing processing conditions to generate phase pure YAG films. The fluorescence emission wavelength and related lifetime of certain electronic transitions arising from metal cation dopants vary as a function of pressure and temperature suggesting their use as optical sensors. This work suggests the possible application of these films as pressure-temperature sensors in a planar waveguide configuration or as a coating material for optical fibers.

10416 (PNL-SA–25035) **The development of mechanical strength in a ceramic material during firing.** Bunnell, L.R. (Pacific Northwest Lab., Richland, WA (United States)); Piippo, S.W. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9411179–1: National Educators' workshop '94, Gaithersburg, MD (United States), 7-9 Nov 1994). Order Number DE95004925. Source: OSTI; NTIS; GPO Dep.

This experiment was designed for high school students who have a very limited background in ceramic materials, but the experiments could also be used at the college level. The objective of the experiment is to teach students about the development of mechanical strength in a ceramic material as a result of the firing process and about testing methods used for brittle materials. In the experiment, clay-based ceramic bars of uniform circular cross section are prepared by extrusion. The bars are then fired at temperatures high enough to achieve high strength by development of a glassy bonding phase. Finally, the bars will be stressed to failure in a simple testing machine. This will quantify the increase in strength as a function of firing temperature.

10417 (PNL-SA-25579) **Amorphization of complex ceramics by heavy-particle irradiations.** Ewing, R.C. (Univ. of New Mexico, Albuquerque, NM (United States). Dept. of Earth and Planetary Sciences); Wang, L.M.; Weber, W.J. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941144-56: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95005725. Source: OSTI; NTIS; INIS; GPO Dep.

Complex ceramics, for the purpose of this paper, include materials that are generally strongly bonded (mixed ionic and covalent), refractory and frequently good insulators. They are distinguished from simple, compact ceramics (e.g., MgO and UO_2) by structural features which include: (1) open network structures, best characterized by a consideration of the shape, size and connectivity of coordination polyhedra; (2) complex compositions which characteristically lead to multiple cation sites and lower symmetry; (3) directional bonding; (4) bond-type variations within the structure. The heavy particle irradiations include ion-beam irradiations and recoil-nucleus damage resulting from a-decay events from constituent actinides. The latter effects are responsible for the radiation-induced transformation to the metamict state in minerals. The responses of these materials to irradiation are complex, as energy may be dissipated ballistically by transfer of kinetic energy from an incident projectile or radiolytically by conversion of radiation-induced electronic excitations into atomic motion. This results in isolated Frenkel defect pairs, defect aggregates, isolated collision cascades or bulk amorphization. Thus, the amorphization process is heterogeneous. Only recently have there been systematic studies of heavy particle irradiations of complex ceramics on a wide variety of structure-types and compositions as a function of dose and temperature. In this paper, we review the conditions for amorphization for the tetragonal orthosilicate, zircon [$ZrSiO_4$]; the hexagonal orthosilicate/phosphate apatite structure-type [$X_{10}(ZO_4)_6(F,Cl,O)_2$]; the isometric pyrochlores [$A_{1-2}B_2O_6(O,OH,F)_{0-1p}H_2O$] and its monoclinic derivative zirconotite [$CaZrTi_2O_7$]; the olivine (derivative - hcp) structure types, α-$^{VI}A_2{}^{IV}BO_4$, and spinel (ccp), γ-$^{VI}A_2{}^{IV}BO_4$.

10418 (PNL-SA-25742) **Femtosecond OPOs at 3 microns and beyond: Design and performance issues related to the crystal properties of KTP and similar materials.** Holtom, G.R. (Pacific Northwest Lab., Richland, WA (United States)); Crowell, R.A.; Cheng, L.K. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950226-7: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-10 Feb 1995). Order Number DE95007286. Source: OSTI; NTIS; GPO Dep.

Femtosecond optical parametric oscillators (OPOs), synchronously pumped by Ti:Sapphire lasers, operating in the near infrared (IR) region are an important light source now under active development. The authors report the results of Ti:Sapphire synchronously pumped noncritically phase matched femtosecond OPOs that are based upon several crystals from the KTP family. The newly developed nonlinear crystal niobium doped KTP (Nb:KTP) has a greater birefringence than undoped KTP and is shown to extend the wavelength farther into the mid-IR. The authors report the first operation of a femtosecond OPO utilizing the solid-solution grown crystal Nb:KTP. Additionally, it is shown that CTA is very useful in mid-IR angle tuned OPOs.

10419 (PPPL-3046) **Proposed experiment to investigate use of heated optical fibers for tokamak diagnostics during D-T discharges.** Tighe, W. (JET Joint Undertaking, Abingdon (United Kingdom)); Morgan, P.; Griscom, D.; Adler, H.; Cylinder, D.; Johnson, D.; Palladino, D.; Ramsey, A. Princeton Univ., NJ (United States). Plasma Physics Lab. Feb 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE95007355. Source: OSTI; NTIS; INIS; GPO Dep.

A collaborative JET/TFTR study has been undertaken to investigate attenuation and luminescence effects due to neutron irradiation of optical fibers heated to 400°C. It is expected that a significant improvement in fiber behavior will be observed due to thermal annealing. This technique may be important for use in fiber-related, tokamak diagnostics exposed to high neutron flux. The study will make use of aluminum jacketed, 600 μm diameter, all silica (F-doped cladding) fibers in lengths of 150 m. The fibers are prepared in 1 foot coils. Of the coils to be irradiated, one is heated constantly to 400°C, a second is not heated, and a third is heated periodically. A fourth fiber coil is not to be irradiated. Spectrally and temporally resolved transmission and luminescence data under neutron irradiation during D-T discharges on TFTR will be obtained. An investigation of permanent and short term effects will be made. Experimental details along with initial results will be presented.

10420 (SAND-93-2642C) **Characterization of polysilicon films by Raman spectroscopy and transmission electron microscopy: A comparative study.** Tallant, D.R. (Sandia National Labs., Albuquerque, NM (United States)); Headley, T.J.; Medernach, J.W.; Geyling, F. Sandia National Labs., Albuquerque, NM (United States). 12 Nov 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-931108-11: Fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 29 Nov - 3 dec 1993). Order Number DE95006858. Source: OSTI; NTIS; GPO Dep.

Samples of chemically-vapor-deposited micrometer and submicrometer-thick films of polysilicon were analyzed by transmission electron microscopy (TEM) in cross-section and by Raman spectroscopy with illumination at their surface. TEM and Raman spectroscopy both find varying amounts of polycrystalline and amorphous silicon in the wafers. Raman spectra obtained using blue, green and red excitation wavelengths to vary the Raman sampling depth are compared with TEM cross-sections of these films. Films showing crystalline columnar structures in their TEM micrographs have Raman spectra with a band near 497 cm^{-1} in addition to the dominant polycrystalline silicon band (521 cm^{-1}). The TEM micrographs of these films have numerous faulted regions and fringes indicative of nanometer-scale silicon structures, which are believed to correspond to the 497cm^{-1} Raman band.

10421 (SAND-94-2833C) **Synthesis and processing of Al_2O_3/Al composites by in situ reaction of aluminum and mullite.** Fahrenholtz, W.G. (Univ. of New Mexico, Albuquerque, NM (United States)); Ewsuk, K.G.; Loehman, R.E.; Tomsia, A.P. Sandia National Labs., Albuquerque, NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950263-1: In-situ reactions for synthesis of composites, ceramics, and intermetalics, Las Vegas, NV (United States), 12-16 Feb 1995). Order Number DE95006224. Source: OSTI; NTIS; GPO Dep.

Al_2O_3/Al composites, were formed by reacting molten aluminum metal with dense mullite ceramic preforms. The composites produced by this reactive metal penetration process (RMP) have a two phase, interpenetrating microstructure in which both the ceramic and the metal are continuous in three dimensions. Scanning electron microscopy (SEM) micrographs of composites produced by RMP show a fine microstructure comprised of interlocked metal and ceramic phases, with a feature size of approximately 2 μm. RMP is a relatively rapid process with metal penetration rates of nearly 5 mm/hour at 1100°C after a short incubation period. An activation energy of 92 kJ/mole was calculated from reaction rate data. Transmission electron microscopy (TEM) micrographs reveal that aluminum metal penetrates along the mullite grain boundaries before reaction with the mullite grains, indicating that diffusion along grain boundaries may be the rate limiting step for the reaction. Thermodynamic information, results of microstructure analyses, and kinetic data indicate that RMP proceeds in 4 stages: (1) Al melting and the formation of a thermodynamically stable metal/ceramic interface; (2) depletion of oxygen from the grain boundaries intersecting the ceramic/metal interface; (3) Al metal penetration into the ceramic preform along grain boundaries; and (4) Al reaction with and conversion of individual mullite grains.

10422 (SAND-94-2986C) **Neutron diffraction studies on recrystallization of solution derived lead zirconate titanates.**

Morosin, B. (Sandia National Labs., Albuquerque, NM (United States)); Tuttle, B.A.; Voigt, J.A.; Lawson, A.C.; Kwei, G.H. Sandia National Labs., Albuquerque, NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000 ; W-7405-ENG-36 ; W-31109-ENG-38. (CONF-950380–1: Annual meeting of the Division of High Polymer Physics of the American Physical Society, San Jose, CA (United States), 20-24 Mar 1995). Order Number DE95004771. Source: OSTI; NTIS; INIS; GPO Dep.

We performed neutron powder diffraction on solution-derived lead zirconate titanates (PZT). Three compositions, PZT 45/55, PZT 20/80 and $PbTiO_3$, were investigated. The materials were annealed so that the perovskite phase had just begun to grow from the precursor phase. In our materials this precursor phase is the pyrochlore rather than fluorite phase. The results show that in the pyrochlore phase, the (Ti,Zr) and the Pb are ordered in their crystallographic sites while the O are essentially disordered in both of the two usual pyrochlore anion sites.

10423 (SAND–94-3000C) **Anomalous phase separation kinetics observed in a micelle system.** Wilcoxon, J.P.; Martin, J.E. Sandia National Labs., Albuquerque, NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941144–52: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95005416. Source: OSTI; NTIS; GPO Dep.

The authors report a real-time, two-dimensional light scattering study of the evolution of structure of a two component nonionic micelle system undergoing phase separation. The micelles act like molecular slug-a-beds whose domain growth is lethargic (i.e. slower than the cube root of time prediction for simple binary fluids). In fact, the growth kinetics can be empirically described as a stretched exponential approach to a pinned domain size. Although the kinetics are not yet understood, the anomalous behavior may be due to the ability of the spherical micelles to reorganize into more complex structures.

10424 (SAND–94-3141C) **Processing and properties of chromate-free conversion coatings on aluminum.** Buchheit, R.G. (Sandia National Labs., Albuquerque, NM (United States)); Drewien, C.A.; Martinez, M.A.; Stoner, G.E. Sandia National Labs., Albuquerque, NM (United States). [1994]. 14p. Sponsored by USDOE, Washington, DC (United States);Virginia Univ., Charlottesville, VA (United States). DOE Contract AC04-94AL85000. (CONF-950304–8: Corrosion '95: National Association of Corrosion Engineers (NACE) international annual conference and corrosion show, Orlando, FL (United States), 26-31 Mar 1995). Order Number DE95004768. Source: OSTI; NTIS; GPO Dep.

A conversion coating method has been developed based on precipitation of $Li_2[Al_2(OH)_6]_2 \cdot CO_3 \cdot 3H_2O$ from alkaline lithium salt solutions. The process is procedurally similar to chromate conversion coating but does not use or produce hazardous chemicals. The coating that forms is polycrystalline, continuous and conformal. The coating meets the MIL-C-5541E corrosion resistance, electrical contact resistance and paint adhesion requirements for certain aluminum alloys, but does not match the levels of performance exhibited by chromate conversion coatings. In this paper, methods for producing the coating are described. Corrosion resistance has been characterized using electrochemical impedance spectroscopy and salt spray exposure. The structural, compositional and property changes attending post-coating thermal exposure are discussed. Performance in standardized corrosion, electrical and paint adhesion tests is also presented.

10425 (SAND–95-0091C) **Effects of acetylacetone additions on PZT thin film processing.** Schwartz, R.W.; Assink, R.A.; Dimos, D.; Sinclair, M.B.; Boyle, T.J.; Buchheit, C.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941144–35: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95006322. Source: OSTI; NTIS; GPO Dep.

Sol-gel processing methods are frequently used for the fabrication of lead zirconate titanate (PZT) thin films for many electronic applications. Our standard approach for film fabrication utilizes lead acetate and acetic acid modified metal alkoxides of zirconium and titanium in the preparation of our precursor solutions. This report highlights some of our recent results on the effects of the addition of a second chelating ligand, acetylacetone, to this process. The authors discuss the changes in film drying behavior, densification and ceramic microstructure which accompany acetylacetone additions to the precursor solution and relate the observed variations in processing behavior to differences in chemical precursor structure induced by the acetylacetone ligand. Improvements in thin film microstructure, ferroelectric and optical properties are observed when acetylacetone is added to the precursor solution.

10426 (SAND–95-0094C) **Optical determinations of energy-band dispersion curves in novel compound semiconductor materials.** Jones, E.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950226–2: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-10 Feb 1995). Order Number DE95006318. Source: OSTI; NTIS; GPO Dep.

We present magnetoluminescence data which provides a quantitative measure of the energy-band dispersion curves of novel compound semiconductor optoelectronic materials. Data for a n-type strained-layer InGaAs/GaAs (quantum-well width $\sim$ 8 nm) and a n-type 4.5-nm-wide GaAs/AlGaAs lattice-matched single-quantum well are presented. We find that the -conduction-bands are almost parabolic, with a mass of about $0.068m_0$ for InGaAs/GaAs and $0.085m_0$ for the GaAs/AlGaAs structure. The valence-bands are nonparabolic with wave vector dependent in-plane valence-band masses varying from about 0.1 m_0 at zone center to about 0.3 m_0 for 20 meV energies.

10427 (SAND–95-0144C) **First-principles calculations for AlN, GaN, and InN: Bulk and alloy properties.** Wright, A.F.; Nelson, J.S. Sandia National Labs., Albuquerque, NM (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95006822. Source: OSTI; NTIS; GPO Dep.

First-principles density-functional calculations utilizing ab initio pseudopotentials and plane-wave expansions are used to determine lattice parameters, bulk moduli, and band structures for AlN, GaN and InN. It is found that large numbers of plane waves are necessary to resolve the nitrogen 2p wave functions and that explicit treatment of the gallium 3d and indium 4d electrons is important for an accurate description of GaN and InN. Several properties of ternary zinc-blende alloys are determined including their bond-length and bond-angle relaxation and their energy-gap bowing parameters. The similarity of the calculated zinc-blende and wurtzite direct gaps also allows estimates to be made of the energy gap versus composition for wurtzite alloys.

10428 (UCRL-JC–116558) **Electronic structure of $(La, Sr)_2CuO_4$ and $Ba_{0.6}K_{0.4}BiO_3$.** Howell, R.H. (Lawrence Livermore National Lab., CA (United States)); Fluss, M.J.; Sterne, P.A.; Kaiser, J.H.; Kitazawa, K.; Kojima, H.; Mosley, W.D.; Dykes, J.W.; Shelton, R.N. Lawrence Livermore National Lab., CA (United States). May 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9405170–8: 10. international conference on positron annihilation, Beijing (China), 23-29 May 1994). Order Number DE95004963. Source: OSTI; NTIS; GPO Dep.

We have measured and calculated the electron-positron momentum distribution of $La_{2-x}Sr_xCuO_4$ samples for Sr concentration of 0, 0.1,0.13, and 0.2 and $Ba_{0.6}K_{0.4}BiO_3$. The momentum distribution of all samples contained features derived from the overlap of the positron distribution with the valence electrons. In addition, discontinuities typical of a Fermi surface are seen in the superconducting samples. The form and position of these features are in general agreement with band theory for both $La_{2-x}Sr_xCuO_4$ and $Ba_{0.6}K_{0.4}BiO_3$. However, the evolution of the Fermi surface with doping in $La_{2-x}Sr_xCuO_4$ differed significantly from expectations based on single electron band theories.

This report contains a brief summary of analytical techniques commonly used for the determination of radiocarbon in a variety of environmental samples. Details of the applicable procedures developed and tested in the Environmental Research Branch at Chalk River Laboratories are appended.

10430 (CEA-N–2752) **Low level transuranic wastes assay by photon interrogation and neutron counting: application to the concrete packages.** Lyoussi, A. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Electronique et d'Instrumentation Nucleaire; Clermont-Ferrand-2 Univ., 63 - Aubiere (France). Mar 1994. 245p. (In French). Order Number DE95619738. Source: OSTI; NTIS (US Sales Only); INIS.

A comprehensive programme is currently in progress at several laboratories for the development of sensitive, practical and non destructive assay techniques for the quantification of low-level transuranics (TRU) in bulk solid wastes. The present document presents an active detection method for radioactive wastes embedded in high-density matrices, mainly concrete packages. The high density of the packages, as well as their high water content (up to 25%), means only high-energy neutrons or gamma particles have a high enough range to activate the enclosed actinides. Our aims were to evaluate the feasibility of dosing transuranians by induced photofission, and to optimize an experimental system with a view to improving detection limits. The system uses a pulsed electron beam from a linear accelerator (LINAC) to produce high-energy photon bursts from a metallic converter. The photons induce fissions in TRU. When a fission is induced in trace amounts of TRU contaminants in waste material, it provides "signatures" from fission products that can be used to assay the material before disposal. We give here the results from counting photofission-induced delayed neutrons from ^{239}Pu, ^{235}U and ^{238}U in three sample matrices: glass, polyethylene and concrete. We counted delayed neutrons emitted after each pulse of the LINAC using the "Sequential PHoton Interrogation and Neutron Counting Signatures" (SPHINCS) technique. The electron linear accelerator operates at 15 MeV, 140 mA and 2.5 μs wide pulse at a 50 Hz rate. Finally, use of an electron linear accelerator as a particle source, experimental and electronics details, measurements results and their interpretation and future experimental works are discussed. (author). 53 refs., 101 figs., 21 tabs.

10431 (CONF-9409219–3) **Potentiometric studies at ORNL with hydrogen electrode concentration cells.** Mesmer, R.E. (Oak Ridge National Lab., TN (United States). Chemical and Analytical Sciences Div.); Palmer, D.A.; Wesolowski, D.J. Oak Ridge National Lab., TN (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Conference on properties of water and steam; Orlando, FL (United States); 12 Sep 1994. Order Number DE95006742. Source: OSTI; NTIS; GPO Dep.

The absence of suitably stable reference electrodes for and to 300 C led ORNL to develop hydrogen electrode concentration cells for studies of equilibria of interest in reactor and steam generator systems to about 300 C during the late 1960's and seventies. During the intervening two dozen years over twenty scientists have participated in potentiometric studies at Oak Ridge and much of that work will be summarized in this paper. A description of hydrogen electrode concentration cells developed in the late sixties and currently in use at Oak Ridge is given. The method of measurement, data interpretation, and published results are reviewed for studies of acid-base ionization, metal ion hydrolysis, and metal complexation reactions using principally such cells in titration or flow modes. 41 refs.

10432 (DOE/PC/90184–T16) **Nuclear magnetic resonance studies of granular flows. Quarterly technical progress report, July 1994–September 1994.** Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM (United States). 7 Nov 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90184. Order Number DE95007990. Source: OSTI; NTIS; GPO Dep.

During this quarter, the authors pursued three aspects of this project. First, the NMR probe geometry was evaluated, particularly for constrained geometries. Second, granular flow in the 'Lovelace drum' geometry was considered including a numerical solution of the relevant equations. Finally, the relationship of the slope of the granular flow surface profile to the angular velocity of the cylinder was studied.

10433 (EGG–2744, pp. 129-135) **A rapid method for the direct analysis of boron in whole blood by atomic emission spectroscopy.** Bauer, W.F. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); White, B.M.; Micca, P.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

The INEL BNCT program has been involved in normal tissue dose tolerance studies using dogs as the large animal model. In order to accurately predict when to begin an irradiation and then determine the length of the radiation required to achieve the desired radiological dose at a specified mean boron concentration, a rapid technique for the determination of boron is required. It has previously been shown that after administration and distribution of $Na_2B_{12}H_{11}SH$ (BSH), the elimination phase has a $T_{\frac{1}{2}}$ of ~300 minutes and one should be able to roughly predict blood B concentrations at specified times during the elimination. However, the physiology can be expected to vary somewhat from animal to animal and the blood B concentrations are expected to vary as well. These variations mean the target B concentrations can easily be missed.

10434 (EGG–2744, pp. 137-142) **Quantification of boron in biological tissue by secondary ion mass spectrometry.** Chia, V.K.F. (Charles Evans & Associates, Redwood City, CA (United States)); Blieler, R.J.; Sams, D.B.; Jones, C.M.; Odom, R.W.; Bauer, W.F.; Gianotto, A.K.; Swartz, C.D. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

The combination of boron-containing drugs and neutron irradiation to combat certain brain cancers has proven to be a viable method for cancer treatment. The effectiveness of this treatment depends on the selectivity of the carrier compound delivering boron to the tumor cells. To date, the most effective brain tumor treatment drug is borocaptate sodium ($Na_2B_{12}H_{11}SH$ or BSH). As new drugs are constantly being synthesized to improve selective delivery of boron to cancer cells any analytical technique capable of quantifying boron at the subcellular level will play an important role in determining the drug's potency for boron neutron capture therapy (BNCT). This paper describes the application of SIMS using a Cameca mass spectrometer to localize and quantify boron in rat tissue after BSH intraveneous delivery.

10435 (EGG–2744, pp. 143-149) **Determination of strongly protein-bound borocaptate species by high performance liquid chromatography with on-line inductively coupled plasma atomic emission spectroscopy detection of boron.** Hotz, N.J. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Bauer, W.F. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. DOE Contract AC07-76ID01570. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

Borocaptate compounds have been studied for many years as a means of delivering ^{10}B to brain tumors prior to neutron exposure

for BNCT. The actual nature of the observed binding of mercaptoundecahydrodecaborate ($B_{24}H_{22}S_2^{4-}$, BSSB) to plasma proteins has been of interest as this will affect both the toxicity and the biodistribution of these anions throughout the body. The toxicity of the borocaptate species may be related to the ability to bind to proteins and compete for sites which normally bind metabolic byproducts. In order to determine the binding properties of proteins, one must be able to detect both proteins and proteins with bound boron. To accomplish this dual detection, an ICP-AES has been coupled to a high performance liquid chromatograph with a UV detector to allow serial detection of the protein and boron.

10436 (INEL–94/0266) **Partitioning of krypton-85 in liquid scintillation cocktail.** Hohorst, F.A.; Sherlock, M.A. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Dec 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE95005404. Source: OSTI; NTIS; INIS; GPO Dep.

Krypton is one of the noble gases. As such, it forms compounds only with exceptionally strong oxidizing agents. The concentration of krypton in air is 1.139 parts per million by volume. In general, its behavior is best described as that of an ideal gas. Krypton-85 is the longest lived of the common radioactive noble gases with a half life of 10.72 years. Gamma radiation at 513.990 keV has an intensity of only 0.434%. Most decay is β^- emission with a maximum energy of 687.0 keV and an average energy of 251.4 keV. The analytical chemistry of krypton-85 is driven by these factors. High concentrations may be gamma counted directly. Low levels are typically determined by more sensitive techniques such as liquid scintillation counting (LSC) where detection limits on the order of 1 picocurie (pCi) are routinely achieved. For a 5 standard cubic centimeter (scc) sample, this represents a concentration of 0.2 pCi/scc, well below the DOE Air Immersion Derived Concentration Guideline (G) of 3 pCi/scc. As a gas, krypton in a sealed LSC vial distributes itself between the liquid phase and the gas phase. Some past work has used gamma counting at levels many orders of magnitude greater than those now achievable by LSC to study the distribution of krypton. This effect is of interest in the analytical chemistry of krypton-85 because geometrical considerations influence how much of the material in the gas phase decays generating particles which then impact the liquid phase where they may be counted.

10437 (INIS-AR–093) **Volumetric and electro analytical techniques for chemical characterization of nuclear grade Ag-In-Cd alloys.** Bandin, N.A.; Laspina, H.V.; Crubellati, R.O.; Magallanes, J.F. 10439 (INIS-BR–3453) **Characteristics of thin and coarse particulates of urban and natural brazilian aerosols.** Orsini, C.Q.; Tabacnics, M.H.; Artaxo, P.; Andrade, M.F.; Kerr, A.S. Sao Paulo Univ., SP (Brazil). Inst. de Fisica. [1994]. 49p. (In Portuguese). Order Number DE95620670. Source: OSTI; NTIS (US Sales Only); INIS.

Thin and coarse particulate were sampled during the period 1982-1985 in a natural coastal forest (Jureia), and five urban-industrial regions (Vitoria, Salvador, Porto Alegre, Sao Paulo and Belo Horizonte). The time variation of the concentration in the air, and the relative elementary composition of the thin and coarse particulate, sampled by thin and Coarse Particulate Sampler (AFG), were determined by gravimetric method and PIXE analysis respectively. The results demonstrated that the ground dust and salt from the sea are unequivocally one of the largest sources of coarse particulate, and also the ground is a significant thin particulate source. 25 refs, 22 figs, 28 tabs. (L.C.J.A.).

10440 (INIS-BR–3454) **Thorium: one of the analytical techniques in neutronic activation and alpha spectrometry of the CDTN (Brazilian Nuclear Technology Development Center) in the last three decades.** Menezes, M.A.B.C.; Sabino, C.V.S. Centro de Desenvolvimento da Tecnologia Nuclear (CDTN), Belo Horizonte, MG (Brazil). [1994]. 3p. (In Portuguese). Order Number DE95620671. Source: OSTI; NTIS (US Sales Only); INIS.

For long years, the CDTN (Brazilian Nuclear Technology Development Center) has applied several analytical techniques in the thorium determination. This work is about the evolution of the neutronic activation in the thorium 232 analysis from the 1960's to now. The importance of the analysis request and alpha spectrometry for the thorium 228 and thorium 232 determination is emphasized. (J.A.M.M.).

10441 (INIS-mf–14444, [pp. 10]) **Instrumental neutron activation analysis of rare earths in 41 geological samples.** Sirisena, K.; Siri-Upathum, K.; Muangnoicharoeen, S.; Busamongkol, A.; Meekhanthong, S.; Srichom, K. Office of Atomic Energy for Peace, Bangkok (Thailand). 1986. 318p. (In Thai). (CONF-8604423–: 1. Nuclear science and technology conference, Bangkok (Thailand), 8-11 Apr 1986). In *Proceedings of the first nuclear science and technology conference no. 1. Nuclear science and its application.* Order Number DE95619739. Source: OSTI; NTIS (US Sales Only); INIS.

Instrumental neutron activation analysis has been applied for the determination of nine rare-earths (La, Ce, Nd, Sn, Eu, Gd, Dy, Yb, Lu) and three heat-producing elements (U, Th, K) in forty-one samples collected from different parts of Thailand. The IAEA standard reference material, SL-1 and the USGS reference rock, AGV-1, were also analyzed for the purpose of verifying the accuracy of the method. The chondrite normalized distribution patterns are generally smooth. Negative Eu anomaly is observed in all samples.

10442 (INIS-mf–14445, pp. 1-9) **The development for a simultaneous determination of mercury and selenium in biological samples by neutron activation and dry combustion technique.** Chue-Inta, W.; Chue-Inta, S. Office of Atomic Energy for Peace, Bangkok (Thailand). 1988. 440p. (In Thai). (CONF-8804346–: 2. Nuclear science and technology conference, Bangkok (Thailand), 19-22 Apr 1988). In *Proceedings of the second nuclear science and technology conference no. 2.* Order Number DE95619740. Source: OSTI; NTIS (US Sales Only); INIS.

The easy and high efficient dry combustion technique has been modified for the simultaneous neutron activation analysis of mercury and selenium in environmental samples. After neutron irradiation the sample is burnt in oxygen stream at 1000^{0}C followed by nitrogen stream at 800^{0}C to separate mercury from selenium and bromine onto activated carbon adsorber in which the Hg-197 can be counted separately from Se-75 and Br-82 using Ge(Li) detector. After a period of decay time, Se-75 can be counted without interference from Br-82. The reliability of the modified technique by analyzing of the IAEA standard referent material, Fish Flesh, has been conducted; resulting 99,20% accuracy.

10443 (INIS-mf–14445, pp. D-2, 1-15) **NAA using Cf-252 after preconcentration.** Panyo, O. (Chiang Mai Univ., Faculty of Science, Department of Chemistry (Thailand)); Moebius, S.; Keller, C. Office of Atomic Energy for Peace, Bangkok (Thailand). 1988. 440p. (In Thai). (CONF-8804346–: 2. Nuclear science and technology conference, Bangkok (Thailand), 19-22 Apr 1988). In

Proceedings of the second nuclear science and technology conference no. 2. Order Number DE95619740. Source: OSTI; NTIS (US Sales Only); INIS.

Neutron activation analysis (NAA) with thermal neutron using Cf-252 sources was applied to elemental analysis of elements in water samples. A high-resolution Ge(Li) detector was employed for gamma-radiation detection. Both suspended particulate matter and liquid fraction were investigated after filtration. Preconcentration method by co-precipitation using iron (III) hydroxide and oxine were chosen for use. Elements which were considered to be able to detect in the present study are Al, As, Cl, K, Mg, Mn, Na, Sr, Ti, U, V and Zn.

10444 (INIS-mf–14445, pp. D-4, 1-20) **Determination of trace elements in cigarette and tobacco by neutron activation analysis.** Nouchpramool, S. Office of Atomic Energy for Peace, Bangkok (Thailand). 1988. 440p. (In Thai). (CONF-8804346–: 2. Nuclear science and technology conference, Bangkok (Thailand), 19-22 Apr 1988). In *Proceedings of the second nuclear science and technology conference no. 2.* Order Number DE95619740. Source: OSTI; NTIS (US Sales Only); INIS.

The objective of this work is to determine the concentration of 22 trace elements in cigarette and tobacco by instrumental neutron activation analysis in which multielements can be analyzed simultaneously with high sensitivity and reliability as well as easy and rapid. It is well known that, trace toxic elements with high concentration may be harmful for health of smokers. Since they might damage the respiratory system and might cause other diseases. The finding for this report can be used as the basis of further study on toxic of trace elements to the smoker. The results of this analysis show that the bromine content in all samples is significantly high, but the concentration of the other elements are varying from one to another. Bromine concentration might come from soil and/or smoked tobacco leaves with methyl bromide as fungicide.

10445 (INIS-mf–14445, pp. D-5, 1-9) **Determination of the uranium content in Japanese cigarettes and hair by fission tracks technique.** Sirinuntavid, S. Office of Atomic Energy for Peace, Bangkok (Thailand). 1988. 440p. (In Thai). (CONF-8804346–: 2. Nuclear science and technology conference, Bangkok (Thailand), 19-22 Apr 1988). In *Proceedings of the second nuclear science and technology conference no. 2.* Order Number DE95619740. Source: OSTI; NTIS (US Sales Only); INIS.

Some Japanese cigarettes were collected to determine uranium content. The average uranium content in dry samples are between 16.6 ppb. to 116 ppb. For 9 ashed samples of smokers' hair, uranium content is between 68.5 ppb. to more than $3.0x10^3$ ppb. and 3 ashed samples of non-smoker's hair, uranium content is between 197 ppb. to 320 ppb. Fission tracks method was used to analyze and mica foils were used as the detector.

There are many types of accelerators, variety of particles and energy ranges depending on the specific uses. The electromagnetic accelerated particles are utilized directly and indirectly to the mankind. Nowadays there are more than 4000 accelerators spread out over the world, using for scientific research and development in the field of medicine, agriculture, industry and environment. This report presents some examples of accelerators such as electron beam and cyclotron, including their structures and applications. The aim of this report is to propose the problem of the possibility to establish the national accelerator in Thailand in the near future.

10447 (INIS-mf–14445, pp. F-2, 1-16) **Uranium by X-ray fluorescence analysis in aqueous and in solid samples.** Ratanalert, N. (Office of Atomic Energy for Peace, Bangkok (Thailand)); Wertenbach, H.; Ache, H.J. Office of Atomic Energy for Peace, Bangkok (Thailand). 1988. 440p. (In Thai). (CONF-8804346–: 2. Nuclear science and technology conference, Bangkok (Thailand), 19-22 Apr 1988). In *Proceedings of the second nuclear science and technology conference no. 2.* Order Number DE95619740. Source: OSTI; NTIS (US Sales Only); INIS.

This paper describes the assay of uranium by X-ray fluorescence analysis in aqueous, nitric solutions and in solid samples after fusion with spectromelt A12 (66% $Li_2B_4O_7$, 34% $LiBO_2$). There is a linear relationship between the measured intensity and the concentration of uranium only up to about 3 mg U/g. In order to correct effects from the matrix the method of the internal standard, the methods of the correction by scattering radiation as well as addition and dilution methods have been applied too. The measurements were performed both with a wavelength dispersive and with an energy dispersive X-ray fluorescence spectrometer; better results were obtained with the wavelength dispersive spectrometer. In agreement with the literature, the errors were smaller for the aqueous solutions than for the solid solutions.

10448 (INIS-mf–14445, pp. F-3, 1-11) **An easy method for the determination of radium-226 using liquid scintillation counter.** Porntepkasemsan, B. (The School of Fisheries, Laboratory of Radiation Ecology, University of Washington (United States)). Office of Atomic Energy for Peace, Bangkok (Thailand). 1988. 440p. (In Thai). (CONF-8804346–: 2. Nuclear science and technology conference, Bangkok (Thailand), 19-22 Apr 1988). In *Proceedings of the second nuclear science and technology conference no. 2.* Order Number DE95619740. Source: OSTI; NTIS (US Sales Only); INIS.

Radon-222 can be found in all environmental samples as a result of decay of radium-226. When a sample solution of radium-226 is mixed with an organic liquid scintillator, radon-222 from decay of radium-226 will be dissolved in a scintillator solvent and light is produced. The technique involves the introduction of 10 ml aliquot into a vial containing 5 ml liquid scintillator solution. The lower limit of detection (LLD) is 0.16 pCi/L at the 95% confidence level. The method is probably rapid and simple and could be applied to both high and low activity of radium-226.

Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

Neutron activation analysis and inductively coupled plasma multielement atomic emission spectrometry are widely used for simultaneous determination of trace elements in water samples. Aluminium is the second most abundant metal in the earth's crust, and activates with thermal neutrons, producing ^{28}Al (T 1/2 = 2.25 min). One of the main problems in the determination of trace amounts of Al by neutron activation analysis is to eliminate or at least reduce the background activity Of ^{28} Al derived from blank values (derived from irradiated polyethylene vials). With this in view, we developed a sensitive analytical procedure for the routine determination of Al in drinking water by thermal neutron activation. The procedure is based on the standard addition method. Various, known amounts of aluminium sulphate (2 to 10 pg Al) were added to 10 ml of drinking water samples (collected from the same water source). Each sample was irradiated for 2 min, and counted for 5 min after a decay time of 1 min. The graph of corrected net intensity vs the amount of added Al standard solution was used to evaluate the intercepts, which correspond to the 10 ml taken from the water source. (authors). 6 refs., 1 fig.

Submitted to Radiochimica Acta.

A method of determining subpicogram quantities of plutonium in soil, mud, water, plant and animal tissues is proposed. Plutonium is chemically isolated from the samples, while the α-active ^{236} Pu is issued to control yield. The plutonium fraction deposited on some backing as well as an uranium containing standard are put in contact with solid state track detectors (SSTD) - foils of polyethyleneterephtalate, and irradiated by thermal neutrons of approximately 10^{15} cm^{-2} fluence. After an appropriate chemical etching, the content of ^{239} Pu in the samples is determined by scanning fission fragment tracks in the SSTD. To control possible uranium impurities in the plutonium fraction, the latter and the standard (in contact with a fresh SSTD) are bombarded by a high fluence of γ-quanta with energies $\leq$ 25 MeV (microtron Bremsstrahlung). We have succeeded in determining the lower limit of ^{235} U impurities at a level of $< 10^{-13}$ g, due to similar photofission cross section of all Pu isotopes. The proposed method provides the determination of ^{239} Pu content in routine analysis with a sensitivity at a level of 10^{-13} g/g. More than one hundred assays for ^{239} Pu content in specimens of above indicated media from Ukraine, Belorussia, Ural region and Germany have been performed. In future, one will hopefully reach a sensitivity of 10^{-14} - 10^{-15} g/g. 14 refs., 2 figs., 82 tabs.

10457 (LA-UR–94-4350) **Selective extraction of trivalent actinides from lanthanides with dithiophosphinic acids and tributylphosphate.** Jarvinen, G. (Los Alamos National Lab., NM (United States)); Barrans, R.; Schroeder, N.; Wade, K.; Jones, M.; Smith, B.F.; Mills, J.; Howard, G.; Freiser, H.; Muralidharan, S. Los Alamos National Lab., NM (United States). [1995]. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-940301–45: 207. spring national meeting of the American Chemical Society (ACS), San Diego, CA (United States), 13-18 Mar 1994). Order Number DE95005249. Source: OSTI; NTIS; INIS; GPO Dep.

A variety of chemical systems have been developed to separate trivalent actinides from lanthanides based on the slightly stronger complexation of the trivalent actinides with ligands that contain soft donor atoms. The greater stability of the actinide complexes in these systems has often been attributed to a slightly greater covalent bonding component for the actinide ions relative to the lanthanide ions. The authors have investigated several synergistic extraction systems that use ligands with a combination of oxygen and sulfur donor atoms that achieve a good group separation of the trivalent actinides and lanthanides. For example, the combination of dicyclohexyldithiophosphinic acid and tributylphosphate has shown separation factors of up to 800 for americium over europium in a single extraction stage. Such systems could find application in advanced partitioning schemes for nuclear waste.

10458 (LA-UR–95-116) **Analysis of surfaces, films and multilayers by resonant laser ablation.** Allen, T.M. (Univ. of California, Davis, CA (United States). Dept. of Chemistry); Smith, C.H.; Kelly, P.B.; Anderson, J.E.; Eiden, G.C.; Garrett, A.W.; Gill, C.G.; Hemberger, P.H.; Nogar, N.S. Los Alamos National Lab., NM (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950226–9: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-10 Feb 1995). Order Number DE95006295. Source: OSTI; NTIS; GPO Dep.

In this manuscript we review briefly the history of Resonant Laser Ablation (RLA), and discuss some current ideas regarding sample preparation, laser parameters, and mechanisms. We also discuss current applications including spectral analysis of trace components, depth profiling of thin films and multilayer structures, and the use of RLA with the Ion Trap Mass Spectrometer (ITMS).

10459 (LA-UR–95-191) **Measurement of high acidity using a renewable-reagent fiber optic sensor.** Kuhn, K.J.; Dyke, J.T. Los Alamos National Lab., NM (United States). [1995]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950158–1: International forum process analytical chemistry (IFPAC), Houston, TX (United States), 22-25

Jan 1995). Order Number DE95006327. Source: OSTI; NTIS; GPO Dep.

The renewable-reagent sensor concept was initially developed to address shortcomings in fiber optic chemical sensors dependent on immobilized, reversible reagents to produce analyte specific responses. The renewable-reagent sensor incorporates semi-selective membranes, analyte specific reagents and remote spectroscopic detection to extract selective responses. While renewable-reagent fiber optic sensor have been demonstrated for a number of chemical sensing applications, the transfer of laboratory prototypes to real world applications require devices which oversample the measurement matrix to differentiate among environmental and analyte specific response components. For example, optical sensor which acquire broadband rather than single wavelength spectroscopic data provide diagnostics regarding the identity of and measurement error associated with matrix interferences. The following describes the fabrication and evaluation of two renewable-reagent fiber optic sensor designs for the measurement of HNO_3 in the 0.1 M to 10.0 M concentration range. Both sensor designs employ an internal pH indicator reagent and broadband visible spectroscopic detection to characterize HNO_3 concentration.

10460 (PNL–10380) **KEMOD: A mixed chemical kinetic and equilibrium model of aqueous and solid phase geochemical reactions.** Yeh, G.T. (Pennsylvania State Univ., University Park, PA (United States). Dept. of Civil Engineering); Iskra, G.A.; Szecsody, J.E.; Zachara, J.M.; Streile, G.P. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 85p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830 ; FG02-91ER61197 ; AC04-94AL85000. Agreement 263646. Order Number DE95006192. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the development of a mixed chemical Kinetic and Equilibrium MODel in which every chemical species can be treated either as a equilibrium-controlled or as a kinetically controlled reaction. The reaction processes include aqueous complexation, adsorption/desorption, ion exchange, precipitation/dissolution, oxidation/reduction, and acid/base reactions. Further development and modification of KEMOD can be made in: (1) inclusion of species switching solution algorithms, (2) incorporation of the effect of temperature and pressure on equilibrium and rate constants, and (3) extension to high ionic strength.

10461 (SAND–94-0948C) **Design and synthesis of a noncentrosymmetric Dipyrromethene Dye.** Meinhardt, M.B. (Sandia National Labs., Albuquerque, NM (United States)); Cahill, P.A.; Kowalczyk, T.C.; Singer, K.D. Sandia National Labs., Albuquerque, NM (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-940813–37: 208. American Chemical Society national meeting, Washington, DC (United States), 21-26 Aug 1994). Order Number DE95006310. Source: OSTI; NTIS; GPO Dep.

Semiempirical methods were applied to the design of a new second order nonlinear optical (NLO) dye through noncentrosymmetric modifications to the symmetric dipyrromethene boron difluoride chromophore. Computational evaluations of candidate structures suggested that a synthetically accessible methoxyindole modification would have second order NLO properties. This new dye consists of 4 fused rings, is soluble in polar organic solvents and has a large molar extinction coefficient (86 x 103). Its measured hyperpolarizability, β, is -44 x 10^{-30} esu at 1367 nm. The methoxyindole therefore induces moderate asymmetry to the chromophore.

10462 (SAND–94-8596C) **A new technique for measuring the separation of closely spaced dislocations using residual contrast conditions.** Angelo, J.E.; Mills, M.J. Sandia National Labs., Albuquerque, NM (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-940753–25: Microscopy Society of America and Microbeam Analysis Society joint meeting, New Orleans, LA (United States), 31 Jul - 5 aug 1994). Order Number DE95007147. Source: OSTI; NTIS; GPO Dep.

In order to measure the spacing of closely spaced dislocations, a method with sufficient spatial resolution must be used. The author presents a method for measuring such spatial resolution. Applications of this method to copper, NiAl, and Ni_3Al will be discussed.

10463 (SAND–95-8460C) **Measurement of ultrashort pulses with a non-instantaneous nonlinearity.** DeLong, K.W. (Sandia National Labs., Livermore, CA (United States)); Ladera, C.L.; Trebino, R.; Kohler, B.; Wilson, K.R. Sandia National Labs., Livermore, CA (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950540–7: 15. conference on lasers and electro-optics and 5th quantum electronics and laser science conference, Baltimore, MD (United States), 21-26 May 1995). Order Number DE95006500. Source: OSTI; NTIS; GPO Dep.

We show how non-instantaneous nonlinearities can be used to characterize an ultrashort pulse in an extension of the Frequency-Resolved Optical Gating technique. We demonstrate this principle using the Raman effect in fused silica.

10464 (UCRL-ID–116643) **Test report for remote vs. contact Raman spectroscopy.** Kyle, K.R. Lawrence Livermore National Lab., CA (United States). May 1994. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95007947. Source: OSTI; NTIS; INIS; GPO Dep.

This report details the evaluation of two methods of spatially characterizing the chemical composition of tank core samples using Raman spectroscopy. One method involves a spatially-scanned fiber optic probe. The fiber optic probe must be in contact with a sample to interrogate its chemical composition. The second method utilizes a line-of-sight technique involving a remote imaging spectrometer that can perform characterization over an entire surface. Measurements using the imaging technique are done remotely, requiring no contact with the sample surface. The scope of this document studies the effects of laser power, distance from each type of probe to the sample surface, and interferences unique to the two methods. This report also documents the results of comparative studies of sensitivity to ferrocyanide, a key contaminant of concern in the underground storage tanks at DOE's Hanford site. The effect of other factors on signal intensity such as moisture content is explored. The results from the two methods are compared, and a recommendation for a Raman hot cell core scanning system is presented based on the test results. This work is part of a joint effort involving several DOE laboratories for the design and development of Raman spectroscopy systems for tank waste characterization at Westinghouse Hanford Company under the auspices of the U.S. Department of Energy's Underground Storage Tank Integrated Demonstration.

10465 (UCRL-JC–118859) **PXAMS – Projectile X ray AMS: X ray yields and applications.** McAninch, J.E. (Lawrence Livermore National Lab., CA (United States). Center for Accelerator Mass Spectrometry); Bench, G.S.; Freeman, S.P.H.T.; Roberts, M.L.; Southon, J.R.; Vogel, J.S.; Proctor, I.D. Lawrence Livermore National Lab., CA (United States). 7 Oct 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941129–13: 13. international conference on the application of accelerators in research and industry, Denton, TX (United States), 7-10 Nov 1994). Order Number DE95006438. Source: OSTI; NTIS; GPO Dep.

Characteristic x rays have recently been explored as a method for the detection and identification of ions in accelerator mass spectrometry (AMS). After analysis in the AMS spectrometer, the ions stop in an appropriately chosen target and the induced x rays identify the ions by atomic number. For the application of AMS to higher mass isotopes, characteristic x rays allow significantly better discrimination of competing atomic isobars than is possible using energy loss detectors. Characteristic x rays also show promise as a convenient component in hybrid detection systems. Measurements of x ray yields are presented for Si, Fe, Ni, Se, Mo, and Pd ions of 0.5–2 MeV/AMU. The yields rise by more than a factor of 10 over this energy range, and approach 1 x-ray per incident ion at 2 MeV/AMU for the lighter ions. Preliminary work on the application of PXAMS to the detection of ^{79}Se is described.

10466 (VTT-TIED–1503) **Determination of natural uranium series isotope ratios by mass spectrometry.** Kumpulainen, H. Technical Research Centre of Finland, Espoo (Finland). Sep 1993. 19p. (In Finnish). Order Number DE95620750. Source: OSTI; NTIS; INIS.

Mass spectrometric methods for the determination of natural uranium series disequilibrium were reviewed by means of a literature survey. Thermal ionization mass spectrometry (TIMS) has been used for this purpose with satisfactory results, but there were no studies for geological specimens using the newer variant, the Inductively Coupled Plasma Mass Spectrometry (ICP-MS). In spite of problems of sensitivity and reproducibility, a few feasibility studies show that ICP-MS by means of development has potential for certain applications. (au.) (15 refs., 3 figs., 3 tabs.).

10467 (WHC-SD-CP-TP–077-Rev.1) **Precipitation of plutonium from acidic solutions using magnesium oxide.** Jones, S.A. Westinghouse Hanford Co., Richland, WA (United States). 5 Dec 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005435. Source: OSTI; NTIS; INIS; GPO Dep.

Magnesium oxide will be used as a neutralizing agent for acidic plutonium-containing solutions. It is expected that as the magnesium oxide dissolves, the pH of the solution will rise, and plutonium will precipitate. The resulting solid will be tested for suitability to storage. The liquid is expected to contain plutonium levels that meet disposal limit requirements.

Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941257–1: Workshop on clusters and nanostructured materials, Bhubaneswar (India), 29 Dec 1994 - 4 jan 1995). Order Number DE95007089. Source: OSTI; NTIS; GPO Dep.

Chemical probes have been developed to provide insight into the geometrical structure of isolated transition metal clusters. By determining as a function of cluster size the number of adsorbate molecules that saturate a cluster, and/or the binding energy of molecules to cluster surfaces, it is often possible to propose geometrical structures consistent with the experimental observations. The authors review recent studies of the reactions of cobalt, nickel, and copper clusters with ammonia, water, and nitrogen that provide structural information. It is found that small (between 50 and 150 atoms) cobalt, nickel, and copper clusters generally adopt icosahedral packing. However, for even smaller (less than 20 atoms) clusters, cobalt and nickel differ in their structure. The authors also see evidence for adsorbate-induced structural changes. These changes may allow the properties of materials fabricated from such clusters to be tailored to specific needs. A preliminary illustration of the dramatic effect that heteroatoms can have on metal cluster chemical properties is presented.

10469 (ANL/CHM/PP–80412) **Particle-like absorption spectra in small transition metal clusters.** Knickelbein, M.B. Argonne National Lab., IL (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95007082. Source: OSTI; NTIS; INIS; GPO Dep.

Research at Argonne has found that small clusters of certain transition metal atoms display optical absorption spectra that are fundamentally different from those typically observed for other small molecules. A new laser technique known as photodissociation spectroscopy was used to record the absorption spectra of nickel clusters containing three to seven atoms and of niobium clusters containing between seven and twenty atoms. Instead of displaying spectra with distinct and separate absorption "bands" as is usually seen for small molecules, these metal clusters possess absorption spectra that are continuous and smooth throughout the visible and near ultraviolet regions, indicating that they absorb light at every wavelength. This behavior is in fact more like that displayed by much larger metal particles containing hundreds or thousands of atoms. This surprising result may indicate that the electronic structures of these small clusters are much closer to those of a corresponding macroscopic piece of nickel or niobium metal than was previously thought. These studies are aimed at understanding the electronic structure of the active metal cluster sites in catalysts, and may in addition provide valuable insights into the design and properties of new cluster assembled materials.

10470 (ANL/MSD/CP–85241) **Analysis of the dimerized Sb/Si(001)-(2x1) surface by x-ray standing waves.** Lyman, P.F. (Northwestern Univ., Evanston, IL (United States)); Qian, Y.; Bedzyk, M.J. Argonne National Lab., IL (United States). Dec 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941144–61: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95007097. Source: OSTI; NTIS; INIS; GPO Dep.

X-ray standing wave measurements were undertaken to study the bonding position of Sb adatoms on the Sb-saturated Si(001)-(2x1) surface. Using the (004) and (022) Bragg reflections, the authors find that the Sb atoms form dimers, and that the center of the Sb ad-dimers lies 1.64 Å above the bulk-like Si(004) surface atomic plane. These in-plane results are compared to two structural models consisting of dimers whose bonds are parallel to the surface plane and whose centers are either shifted or unshifted (parallel to the dimer bond direction) relative to the underlying substrate planes. The authors thus find two special cases consistent with these data: one with symmetric (unshifted) dimers having a dimer bond length of 2.81 Å, and the other with midpoint-shifted dimers, having a bond length of 2.88 Å and a lateral shift of 0.21 Å.

10471 (CONF-9408210–1) **The role of hydrogen in the hydrogenation and hydrogenolysis of aniline on the nickel single crystal surfaces: Its implication on the mechanisms of HDN reactions.** Huang, S.X. (Univ. of Michigan, Ann Arbor, MI (United States)); Gland, J.L.; Fischer, D.A. Michigan Univ., Ann Arbor, MI (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER14190. From 2. international symposium on advances in hydrotreating catalysts; Washington, DC (United States); 22-26 Aug 1994. Order Number DE95006687. Source: OSTI; NTIS; INIS; GPO Dep.

The selectivity of hydrogenation and hydrogenolysis reactions for organonitrogen compounds on transition metal surfaces depends heavily on the availability of surface hydrogen surface under reaction conditions. The surface hydrogen produced during dehydrogenation of adsorbed aniline upon thermal activation does not significantly modify hydrogenolysis reactions because it desorbs below the reaction temperatures. A series of experiments which use external hydrogen to control the concentration of surface hydrogen at reaction temperatures are reported here. In situ kinetic measurements in the presence of reactive hydrogen environments have been used to probe the details of the adsorbed species and reaction mechanisms. Nickel single crystals have been used as well defined model catalysts for hydrodenitrogenation (HDN) reactions. Previously, the effect of external hydrogen on aniline hydrogenolysis on the Pt(111) surface has been reported. On Pt(111), C-N bond activation is substantially enhanced in the presence of hydrogen. The increased C-N bond cleavage is facilitated by hydrogen which maintains a parallel adsorption of the aromatic derivative of aniline. In the absence of surface hydrogen, the adsorbed intermediate tilts away from surface because of partial dehydrogenation with increasing temperature at about 400 K. This paper will discuss a recent study of aniline reactions on the Ni(100) and Ni(111) surfaces both in the presence and absence of hydrogen. Reactivity comparisons will also be made for these two nickel surfaces towards adsorbed aniline.

10472 (CONF-9409219–4) **Thermodynamics of aqueous electrolytes at high temperatures by the isopiestic technique.** Holmes, H.F. (Oak Ridge National Lab., TN (United States). Chemical and Analytical Sciences Div.); Mesmer, R.E. Oak Ridge National Lab., TN (United States). [1994]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Conference on properties of water and steam; Orlando, FL (United States); 12 Sep 1994. Order Number DE95006747. Source: OSTI; NTIS; GPO Dep.

Excess thermodynamic properties of a wide variety of aqueous electrolyte solutions at elevated temperatures have been determined with the ORNL high-temperature isopiestic facility. This

unique experimental apparatus provides very precise results over the useful temperature range of 110 to 250 C. The isopiestic method is a comparative technique which, in the present case, uses the Pitzer-Peiper-Busey formulation for NaCl(aq) as the reference electrolyte. At elevated temperatures the ion-interaction model of Pitzer continues to be the most useful description of the experimental results. The authors experimental program has included the alkali metal chlorides, sulfates, hydroxides, bromides, and bisulfates, the alkaline earth metal chlorides, and several specific compounds of scientific and practical interest. Numerous common-ion mixed electrolyte solutions have also been investigated in this program. In general, the activity coefficients of all the studied electrolytes decrease with increasing temperature. However, prominent differences between members of the same family remain, particularly when considered as the excess Gibbs free energy. The tendency for ion association increases with increasing temperature and becomes a factor at the higher temperatures. Trends and specific effects are illustrated with examples taken from the database generated in their high-temperature thermodynamic program.

10473 (CONF-9409219–5) **Electrical conductivity measurements of aqueous electrolyte solutions at high temperatures and high pressures.** Ho, P.C.; Palmer, D.A. Oak Ridge National Lab., TN (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Conference on properties of water and steam; Orlando, FL (United States); 12 Sep 1994. Order Number DE95006748. Source: OSTI; NTIS; INIS; GPO Dep.

In aqueous solutions all electrolytes tend to associate at high temperatures (low dielectric constants). Ion association results in the formation of uncharged substrates, which are substantially more volatile than their precursor ions. Thus knowledge of the association constants is important in interpreting the thermodynamics of the partitioning of electrolytes to the vapor phase in a fully speciated approach. Electrical conductance measurements provide a unique window into ionic interactions of solutions at high temperatures and pressures. In this study, the electrical conductivities of dilute (<0.1 molal) aqueous solutions of NaCl (100-600°C to 300 MPa) and sodium and potassium hydroxides (0-600 and 100-600°C, respectively, and to 300 MPa) were measured. The results show that the extent of association of Na^+ and Cl^- is similar to those for Na^+ and K^+ with OH^- in solution from subcritical to supercritical conditions.

10474 (CONF-9409219–6) **D/H and $^{18}O/^{16}O$ partitioning between water liquid and vapor in the system H_2O-Na-K-Mg-Ca-Cl-SO_4 from 0 to 350°C.** Horita, J.; Wesolowski, D.J.; Cole, D.R. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Conference on properties of water and steam; Orlando, FL (United States); 12 Sep 1994. Order Number DE95007013. Source: OSTI; NTIS; GPO Dep.

Oxygen and hydrogen isotope partitioning between liquid water and water vapor has been precisely determined by means of direct mass-spectrometric measurements of isotopic abundances of the two phases from room temperature to 350°C. Measurable changes in the liquid-vapor partitioning were observed upon the addition of salts (NaCl, KCl, $MgCl_2$, $CaCl_2$, Na_2SO_4, and $MgSO_4$) to the system. The results of isotope partitioning for the isotopic mixtures and the literature data of vapor pressure measurements of separate isotopic waters agree well for pure water, but show notable discrepancy for salt solutions.

10475 (CONF-9409219–7) **Aqueous electrolyte modeling in ASPEN PLUS™.** Bloomingburg, G.F. (Univ. of Tennessee, Knoxville, TN (United States). Dept. of Chemical Engineering); Simonson, J.M.; Moore, R.C.; Mesmer, R.E.; Cochran, H.D. Oak Ridge National Lab., TN (United States). [1995]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Conference on properties of water and steam; Orlando, FL (United States); 12 Sep 1994. Order Number DE95007008. Source: OSTI; NTIS; GPO Dep.

Includes vugraphs.

The presence of electrolytes in aqueous solutions has long been recognized as contributing to significant departures from thermodynamic ideality. The presence of ions in process streams can greatly add to the difficulty of predicting process behavior. The difficulties are increased as temperatures and pressures within a process are elevated. Because many chemical companies now model their processes with chemical process simulators it is important that such codes be able to accurately model electrolyte behavior under a variety of conditions. Here the authors examine the electrolyte modeling capability of ASPEN PLUS™, a widely used simulator. Specifically, efforts to model alkali metal halide and sulfate systems are presented. The authors show conditions for which the models within the code work adequately and how they might be improved for conditions where the simulator models fail.

10476 (DOE/CE/23810–42C) **Investigation into the fractionation of refrigerant blends. Quarterly technical status report No. 1, April 1, 1994–June 30, 1994.** Biancardi, F. (United Technologies Research Center, East Hanford, CT (United States)). Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States). Jul 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. (UTRC-R–94-970566-1). Order Number DE95006646. Source: OSTI; NTIS; GPO Dep.

While refrigerant blends offer performance advantages, there are apparently significant service and operational issues raised by the use of these blends. The objective of this ARTI-sponsored program is to conduct analytical and laboratory tests aimed at understanding the fractionation of refrigerant blends, developing approaches or techniques to predict these effects and/or overcome these potential problems.

10477 (DOE/ER/13772–T2) **Kinetics and dynamics of oxidation reactions involving adsorbed CO species on bulk supported Pt and copper oxides. Final project report, January 1, 1991–December 31, 1993.** Conner, Wm.C.; Harold, M. Massachusetts Univ., Amherst, MA (United States). Dept. of Chemical Engineering. [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER13772. Order Number DE95006420. Source: OSTI; NTIS; GPO Dep.

This research was an integrated experimental and modeling study of oxidation reactions involving CO as a key player - be it a reactant, adsorbed intermediate, and/or partial oxidation product - in the catalytic sequence and chemistry. The reaction systems of interest in the project include CO, formaldehyde, and methanol oxidation by O_2, and CO oxidation by NO, on both Pt and copper oxide catalysts. These reactions are of importance in automobile exhaust catalysis. There is a paucity of rate data in the literature for these important environmental control reactions. A complicating factor is the propensity of these reactions to exhibit complex steady state and dynamic behavior, including multiple rate controlling steps, steady state multiplicity, and oscillatory phenomena. Such phenomena are rooted in some of the central issues of catalysis, including adsorbate interactions, and catalyst structural instabilities, such as surface reconstruction and surface chemical changes by oxidation- reduction. The goal of this research is to better understand the catalytic chemistry and kinetics of oxidations reactions involving CO as an adsorbed intermediate. Successfully meeting this goal requires an integration of basic kinetic measurements, in situ catalyst surface monitoring, kinetic modeling, and nonlinear mathematical tools. While the kinetics experiments have standard microreactor design, the potential for multiple and periodic rate states demands detailed procedures to pinpoint the bifurcation (ignition, extinction, Hopf) points. Kinetic models are constructed from rational mechanistic sequences and sound surface chemistry.

10478 (DOE/ER/14190–T1) **[Hydrogen induced C-C, C-N, and C-S bond activities on Pt and Ni surfaces]: Summary.** Gland, J.L. Michigan Univ., Ann Arbor, MI (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER14190. Order Number DE95006251. Source: OSTI; NTIS; GPO Dep.

This document summarizes research applied to chemical bond activation studies. Topics summarized include: Carbon nitrogen bonds experimentation with aniline on Ni(111), Mi(100), and Pt(111) surfaces; carbon sulfur bonds experimentation with methanethiol, phenylthiol, and dimethyl disulfide on Pt(111) and Ni(111) surfaces; carbon-carbon bonds experimentation on Ni(100),

Ni(111) and Pt(111) surfaces; and in-situ fluorescence yield near edge spectroscopy.

10479 (DOE/PC/92106–T7) **Charge distribution analysis of catalysts under simulated reaction conditions. Technical progress report, seventh quarter, April 1, 1994–June 30, 1994.** Freund, F. Surface/Interface, Inc., Mountain View, CA (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92106. Order Number DE95006943. Source: OSTI; NTIS; GPO Dep.

The charge distribution of heterogeneous catalysts (such as iron oxides) has been measured under reaction conditions. During this period, various problems with the analysis equipment were rectified.

10480 (EGG–2744, pp. 161-165) **Purity and quality determinations of borocaptate sodium.** Gianotto, A.K. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Bauer, W.F. EG and G Idaho, Inc., Idaho Falls, ID (United States). May 1994. DOE Contract AC07-76ID01570. In *INEL BNCT research program publications, 1993.* 210p. Order Number DE95002043. Source: OSTI; NTIS; INIS; GPO Dep.

The chemical purity or "quality" of any drug can influence its action in the body. Knowledge of the chemical purity of the boron delivery agent borocaptate sodium ($Na_2B_{12}H_{11}SH$ or BSH) can have a direct effect upon its toxicity, biodistribution and the proper interpretation of experimental data. The FDA requires that drugs seeking Orphan Drug status or an investigational new drug (IND) be chemically characterized. The purity of BSH is most often determined by liquid chromatographic procedures. The purity and "quality" of any chemical compound is only as good as the techniques used to characterize it and the number of potential impurities actively sought in the sample. For these reasons, the somewhat more rigorous approach to purity determinations of BSH described here has been adopted by our laboratory.

10481 (GKSS–94/E/48) **Combined process of gas permeation and condensation for separation and recovery of organic vapours from off-gas streams.** Nitsche, V. (GKSS-Forschungszentrum Geesthacht GmbH (Germany)). GKSS-Forschungszentrum Geesthacht GmbH (Germnay); Technische Univ. Hamburg-Harburg, Hamburg (Germany). Promotionsausschuss. 1994. 209p. (In German). Order Number DE95755997. Source: OSTI; NTIS (US Sales Only).

The combination of gaspermeation and partial condensation as a new process to separate and recover organic vapours from waste gas streams has been studied. Results from experimental investigations under laboratory as well as technical conditions provide the basis for enlargement of existing theoretical models. New calculation programs, which facilitate reliable design of this hybrid process, have been developed. (orig.)

10482 (INIS-BR–3468) **Isotope effects in the non enzymic glucation of hemoglobin catalyzed by phosphate.** Gil, H. (Universidad de Los Andes, Merida (Venezuela)); Mata-Segreda, J.; Schowen, R. Santa Catarina Univ., Florianopolis, SC (Brazil). 1991. 21p. (CONF-9104435–: 1. Latin-American Conference on Organic Physico-Chemistry, Florianopolis (Brazil), 1-5 Apr 1991). Order Number DE95620792. Source: OSTI; NTIS (US Sales Only); INIS.

The reaction of hemoglobin, mainly at the N-terminal valine, with glucose exhibits identical rates in protium and deuterium oxides, both for the buffer-independent rate and for the first-order rate in phosphate buffer. Under the conditions employed, imine formation is relatively rapid and events in the course of the Amadori rearrangement must limit the rate. A very-slow, phosphate-induced reorganization of hemoglobin-glucose imine may be the most likely candidate for the rate-limiting step. (author).

10483 (INIS-mf–14471, pp. 18-21) **Evaluation of temperature distribution in a nuclear fuel with cladding detachment.** Szanto, M. (Ben-Gurion Univ. of the Negev, Beersheba (Israel)); Haim, M.; Weiss, Y.; Aharon, Y.; Barnea, Y. Israel Nuclear Society, Yavne (Israel); Israel Radiation Protection Association (Israel); Radiation Research Society of Israel (Israel); Israel Society of Medical Physics (Israel). Israel Nuclear Society, Yavne (Israel). Nov 1994. Sponsored by Technion Research and Development Foundation Ltd., Haifa (Israel);Israel Electricity Co., Tel Aviv (Israel);Israel Atomic Energy Commission, Tel Aviv (Israel);Ministry of Energy and Infrastructure, Jerusalem (Israel). (CONF-9411188–: 1994 joint meeting of the nuclear societies of Israel, Tel Aviv (Israel), 28-29 Nov 1994). In *Transactions of the nuclear societies of Israel Joint meeting 1994.* 234p. Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

The interaction of a radiation field with a nuclear material of a fuel cartridge is expressed by local changes of physical nature. The cladding material, submerged in a corrosive atmosphere and designed to be in intimate contact with the mechanically dynamic fuel, is often detached both in axial and circumferential directions. This separation is characterized by poor heat transfer conductance through the cladding, affecting the nominal temperature distribution by increasing the values beyond the maximum safety limit of design. Furthermore, in extreme conditions, the local overheating of the nuclear fuel will cause the evaporation of the coolant flow along the cladding and ultimately the melting of the fuel. Previous analytical analysis, limited by the complex nature of the topic, enable only 2-dimension approximations where the separation is considered to be completely circumferential along a prescribed axial length. Alternately, one can consider a separation of the full length over a prescribed angle. Considering the above mentioned and the present advanced numerical calculation tools, a 3-D precise calculation of the temperature distribution in a nuclear fuel motivated the present work.(authors). 1 ref., 4 figs.

10484 (PSI–95-03) **Volatilization of nuclear reaction products from molten metallic targets.** Eichler, B. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Dressler, R. Paul Scherrer Inst. (PSI), Villigen (Switzerland). Feb 1995. 42p. (In German). Order Number DE95620771. Source: OSTI; NTIS; INIS.

The differential molar enthalpies of volatilization of all metallic elements (microcomponents) from 38 molten metals are presented. The calculations are based on the MIEDEMA-model. The differential molar enthalpies of volatilization of the microcomponents are found as a periodic function of their atomic number. The predicted behaviour of volatile products are compared with the results of radiochemical experiments. Particularly the problems of volatilization of spallation products from molten Pb- or Bi-targets in Spallation Neutron Sources are discussed. Getter metals are proposed to reduce the volatility of Hg and Po from this target melts. (author) 41 figs., 2 tabs., 41 refs.

10485 (SAND–94-1770C) **Molecular approach to mesoporous metal sulfides.** Anderson, M.T.; Newcomer, P. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941144–48: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95005418. Source: OSTI; NTIS; GPO Dep.

We have synthesized metal-sulfide/surfactant nanocomposite materials by cooperative assembly of molecular precursors in a aqueous medium. The template-mediated synthetic approach is applicable to metals sulfides that exhibit aqueous thiometallate chemistry. The products are lamellar and have a bilayers or interdigitated layers of surfactant molecules sandwiched between metal sulfide layers. The layers of anionic metal sulfide molecules are not completely condensed in the nanocomposites, which results in a negative charge on the metal sulfide layers. The materials are stable at room temperature in water, methanol, 1 M HCl, 30 wt% NH_3, and 1 M NaOH. The materials do not dissolve at 80°C in water and are stable to at least 180°C in air. The nanocomposites exhibit ion exchange of smaller surfactants, alkali-metal ions, and divalent metal ions.

10486 (SAND–94-3196C) **Comparison of bridged polysilsesquioxane xerogels prepared from methoxy- and ethoxy-silyl monomers.** Loy, D.A. (Sandia National Labs., Albuquerque, NM (United States)); Baugher, B.; Assink, R.A.; Prabakar, S.; Shea, K.J. Sandia National Labs., Albuquerque, NM (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941144–29: 1994 fall meeting of the Materials Research Society (MRS),

Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95005422. Source: OSTI; NTIS; GPO Dep.

Hydrocarbon-bridged polysilsesquioxanes are prepared by the sol-gel polymerization of monomers with more than one trialkoxysilyl group attached directly to the bridging group by Si-C bonds. While the effects of varying the identity of the bridging group (length, rigidity, etc.), monomer concentration, and type of catalyst have been studied, the effect of different alkoxy ligands on the silicon atoms has not been investigated. For this study, 1, 6–bis(triethoxysilyl)hexane 1 and 1, 6-bis(trimethoxysilyl)hexane 2 were polymerized under acidic and basic conditions in ethanol and methanol, respectively, and in tetrahydrofuran (THF). The resulting gels were processed to afford xerogels that were characterized by SEM, solid state ^{13}C and ^{29}Si Cross Polarization Magic Angle Spinning (CP MAS) NMR spectroscopy, and nitrogen sorption porosimetry.

10487 (SAND–94-3197C) **Porosity in hexylene-bridged polysilsesquioxanes: Effects of monomer concentration.** Baugher, B. (Sandia National Labs., Albuquerque, NM (United States)); Loy, D.A.; Assink, R.A.; Prabakar, S.; Shea, K.J.; Oviatt, H. Sandia National Labs., Albuquerque, NM (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941144–28: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95005421. Source: OSTI; NTIS; GPO Dep.

Hexylene-bridged polysilsesquioxanes can be prepared as mesoporous or non-porous xerogels simply by switching from basic to acidic polymerization conditions. In this study, we looked at the effect of monomer concentration on porosity of hexylene-bridged xerogels prepared under acidic and basic conditions. 1, 6-Hexylene-bridged polysilsesquioxanes were prepared by sol-gel polymerizations of 1, 6-bis(triethoxysilyl)hexane 1 with concentrations between 0. 1 to 1.2 M in ethanol. Gelation times ranged from seconds for 1.2 M concentration to months for 0.2 M. The gels were processed into xerogels by an aqueous work-up and the dry gels characterized by scanning electron microscopy (SEM), solid state ^{13}C and ^{29}Si CP MAS NMR spectroscopy, and gas sorption porosimetry.

10488 (CONF-9409219–8) **A potentiometric study of the hydrolysis of ethylenediaminetetraacetic acid to 150°C.** Palmer, D.A. (Oak Ridge National Lab., TN (United States)); Nguyen-Trung, Chinh. Oak Ridge National Lab., TN (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Conference on properties of water and steam; Orlando, FL (United States); 12 Sep 1994. Order Number DE95007039. Source: OSTI; NTIS; GPO Dep.

Ethylenediaminetetraacetate anions, $EDTA^{4-}$, were titrated in a hydrogen-electrode concentration cell with an acidic titrant from 0 to 150°C at 25°C intervals. These titrations were carried out in the presence of 0. 1, 0.2, and 1.0 $mol \cdot kg^{-1}$ with the supporting electrolytes, sodium chloride, NaCl, and 1.0 $mol \cdot kg^{-1}$ tetramethylammonium trifluoromethylsulfonate, $(CH_3)_4N(F_3CSO_3)$ {TMATFMS} in order to assess the effect of both cation complexation by $EDTA^{4-}$ and anion activity coefficient variations. The resulting hydrolysis quotients are discussed with reference to applications in boiler and heat exchanger chemical cleaning, as well as chemical and nuclear waste containment. Some recent diverse uses of this emf technique that also pertain to these applications will be mentioned briefly, e.g., surface absorption - zero-point-of-charge - measurements to high temperatures and in situ pH measurements in solubility and kinetic experiments.

10489 (PNL-SA–25465) **Processing and electrochemical properties of mixed conducting $La_{1-x}A_xCo_{1-y}Fe_yO_{3-\delta}$ (A=Sr, Ca).** Weber, W.J.; Stevenson, J.W.; Armstrong, T.R.; Pederson, L.R. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941144–32: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95004910. Source: OSTI; NTIS; GPO Dep.

Powder compositions in the series $La_{1-x}A_xCo_{1-y}Fe_yO_{3-\delta}$ (A = Sr, Ca) have been prepared by a combustion synthesis method. Sintering of pressed powders produced high-density test specimens with the perovskite structure. The specimens exhibited high electrical conductivities with appreciable oxygen-ion conductivity that increased with Co content for the compositions studied. Oxygen permeation studies showed a significant flux of oxygen that increased with temperature for specimens in a $P(O_2)$ gradient with no applied field. Thermogravimetric studies of the $La_{1-x}Sr_xCo_{0.2}Fe_{0.8}O_{3-\delta}$ system indicated a reversible mass loss with increasing temperature that increased with Sr content.

The subcontract from Los Alamos National Laboratory to Kansas State University has been completed and this is the final report. The progress under this contract is described in three sections (i) electronic quenching kinetics of KrF(B,C) and $Kr_2F(4^2\Gamma)$ molecules, (ii) photochemical excitation of van der Waals molecules containing Xe and Kr, and (iii) cumulative listing of papers published with support of this contract.

10492 (NREL/TP–430-6534) **High-temperature photochemical destruction of toxic organic wastes using concentrated solar radiation.** Dellinger, B. (Dayton Univ., OH (United States)); Graham, J.L.; Berman, J.M.; Taylor, P.H. National Renewable Energy Lab., Golden, CO (United States); Dayton Univ., OH (United States). May 1994. 313p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE94006912. Source: OSTI; NTIS; GPO Dep.

Application of concentrated solar energy has been proposed to be a viable waste disposal option. Specifically, this concept of solar induced high-temperature photochemistry is based on the synergistic contribution of concentrated infrared (IR) radiation, which acts as an intense heating source, and near ultraviolet and visible (UV-VIS) radiation, which can induce destructive photochemical processes. Some significant advances have been made in the theoretical framework of high-temperature photochemical processes (Section 2) and development of experimental techniques for their study (Section 3). Basic thermal/photolytic studies have addressed the effect of temperature on the photochemical destruction of pure compounds (Section 4). Detailed studies of the destruction of reaction by-products have been conducted on selected waste molecules (Section 5). Some very limited results are available on the destruction of mixtures (Section 6). Fundamental spectroscopic studies have been recently initiated (Section 7). The results to date have been used to conduct some relatively simple scale-up studies of the solar detoxification process. More recent work has focused on destruction of compounds that do not directly absorb solar radiation. Research efforts have focused on homogeneous as well as heterogeneous methods of initiating destructive reaction pathways

(Section 9). Although many conclusions at this point must be considered tentative due to lack of basic research, a clearer picture of the overall process is emerging (Section 10). However, much research remains to be performed and most follow several veins, including photochemical, spectroscopic, combustion kinetic, and engineering scale-up (Section 11).

10493 (INIS-BR–3467) **Kinetic study of photo-grafting and photo-cross-linking of a cis-poly butadiene onto cellulose from asymmetric membranes.** Zeni, M. (Universidade de Caxias do Sul, RS (Brazil). Dept. de Fisica e Quimica); Riveros, R.; Schildt, R. Santa Catarina Univ., Florianopolis, SC (Brazil). 1991. 6p. (CONF-9104435–: 1. Latin-American Conference on Organic Physico-Chemistry, Florianopolis (Brazil), 1-5 Apr 1991). Order Number DE95620860. Source: OSTI; NTIS (US Sales Only); INIS.

Photochemical grafting onto cellulose and successive photo cross-linking of 2,00-12,00 $mg.cm^{-2}$ of a cys-poly butadiene, containing 80% cis groups, were investigated kinetically at 30 ^{0} C in the presence of 1,2-diphenyl-2,2-dimethoxy ethanone as a photo initiator to polymer varied between 0,070 and 1,115. Irradiations were carried out poly chromatically, in air or under a stream of nitrogen, with incident radiation of flux I of $2,1.10^{-8}$ $einstein.s^{-1}.cm^{-2}$. In light of this information, the mechanism of photo-grafting and photo-cross linking of cis-poly-butadiene on cellulose surface is discussed. (author).

10494 (JAERI-Research–94-019) **Growth and sedimentation of fine particles produced in aqueous solutions of palladium sulfate and palladium sulfate-silver sulfate induced by gamma-ray irradiation.** Hatada, Motoyoshi (Japan Atomic Energy Research Inst., Neyagawa, Osaka (Japan). Osaka Lab. for Radiation Chemistry); Jonah, C.D. Japan Atomic Energy Research Inst., Tokyo (Japan). Oct 1994. 42p. Order Number DE95747848. Source: OSTI; NTIS; INIS.

It is known that palladium and palladium-silver fine particles were formed from deaerated aqueous solutions of palladium sulfate and palladium sulfate-silver sulfate induced by gamma-ray irradiation. Changes in particle size and with amount of particles in the solution with time during and after irradiation were studied using dynamic light scattering technique and UV spectrophotometer. The particles formed from palladium sulfate solution are found to be water-filled bulky particles of diameter of 200 nm, which grow by mutual coagulation even after irradiation was terminated. Average density depends on concentration of palladium ion in the solution and dose, and the lowest density was about 2 g/cm^3 for particles of 200 nm obtained from 0.06 mM solution by 2.4 kGy irradiation. The average density of the particles obtained from palladium sulfate-silver sulfate solutions was smaller than those obtained for the corresponding palladium sulfate solutions. Supersonic agitation destroyed coagulated precipitates to form fine particles, but did not form clusters of a few atoms. (author).

10495 (JAERI-Research–94-024) **Formation of fine solid particles from aqueous solutions of sodium chloropalladate by gamma-ray irradiation.** Hatada, Motoyoshi (Japan Atomic Energy Research Inst., Neyagawa, Osaka (Japan). Osaka Lab. for Radiation Chemistry); Fujita, Iwao; Korekawa, Kei-ichi. Japan Atomic Energy Research Inst., Tokyo (Japan). Oct 1994. 47p. Order Number DE95747887. Source: OSTI; NTIS; INIS.

Studies have been carried out on the radiation chemical formation of palladium fine particles in argon saturated aqueous solutions of sodium chloropalladate without organic stabilizer. The solutions were irradiated with gamma-rays from a cobalt gamma-ray source and the irradiated solutions were subjected to the dynamic light scattering analysis for the particle diameter measurements, and to the UV-visible optical absorption spectroscopy for the measurements of turbidity (absorption at 700 nm) and remaining chloropalladate ion concentrations in the solution. In the solution of pH = 1.95 by HCl, the turbidity increased after the irradiation and then decreased with time. The concentration of remaining palladate ion in the solution decreased by the irradiation, but it gradually increased with time after the irradiation. These phenomena were qualitatively explained by the reaction scheme in that a precursor to the solid particles still exists in the solution after the irradiation was terminated, and that intermediates including the precursor reacted with chloride ion to re-form chloropalladate ions. The average diameter of the particles after the irradiation was ca. 20 nm and it increased with time to 40 nm at 2.75 kGy, and to 80 nm at 8.25 kGy absorption of radiation. The solution of pH = 0.65 by HCl was found to give lower yields of particles than those observed for the solution of pH = 1.95, and to give the particles of diameters about 150-200 nm. In the solution containing $HClO_4$ instead of HCl, palladium particles were also formed by the irradiation, whereas no backward reaction after the irradiation was observed due to the low concentration of chloride ion in the solution. The average diameter of the particles after the irradiation was about 300 nm and increased with time after the irradiation to a final values which was found to depend on pH of the solution and dose. (author).

10496 (OEFZS–4719) **Advanced oxidation process based on ozone/electron beam irradiation for treating groundwater.** Gehringer, P.; Eschweiler, H.; Fiedler, H. Oesterreichisches Forschungszentrum Seibersdorf GmbH (Austria). Jun 1994. 10p. Order Number DE95620861. Source: OSTI; NTIS (US Sales Only); INIS.

Also published in Proc. AWWA 1994 Annual Conference, New York, June 1994.

There are several methods of generating OH free radicals from ozone and/or hydrogen peroxide and ultraviolet light. They all have in common that the OH free radicals originate in one single source only whereas in the combination of ozone with ionizing radiation two simultaneous working sources for the OH free radicals exist. The resulting higher OH free radical concentration makes this process especially apt for the remediation of low level contaminated groundwater as for example trichloroethylene (TCE) contamination in the sub-ppm range. A cost comparison between O_3/UV and O_3/electron beam for remediation of a groundwater contaminated with 100 ppb TCE indicated that for a throughput of about 5 million gallons/day the O_3/electron beam process is more cost-effective. 10497 (BNL–61149) **Proceedings of the Fifth International Workshop on Targetry and Target Chemistry.** Dahl, J.R.; Ferrieri, R.; Finn, R.; Schlyer, D.J. (eds.). Brookhaven National Lab., Upton, NY (United States). 1994. 392p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

The goal of the International Workshop on Targetry and Target Chemistry series has always been to provide an open forum for discussion of medical radionuclide production, primarily with particle accelerators. The format is intended to encourage the participants to set the direction of the ensuing discussion, allowing the participants to focus on areas of greatest immediate interest. The preceding workshops have set this tone and this workshop was designed to continue in this spirit. The topics of each session were selected by the local organizing committee after discussion with many of the attendees of the previous workshops. The formality of the workshops has gradually increased from the first rather small, very informal gathering in Heidelburg to the larger contingent present in Villigen, but the open discussion of topics of preoccupation has been maintained. Each Workshop has had areas of particular fascination. In the Fifth workshop the major focus was on the development of new accelerators and on the production of ammonia. Selected papers are indexed separately for inclusion in the Energy Science and Technology Database.

apparatus. Grudpan, K. (Chiang Mai Univ., Faculty of Science, Dept. Chemistry (Thailand)). Office of Atomic Energy for Peace, Bangkok (Thailand). 1988. 440p. (In Thai). (CONF-8804346–: 2. Nuclear science and technology conference, Bangkok (Thailand), 19-22 Apr 1988). In *Proceedings of the second nuclear science and technology conference no. 2.* Order Number DE95619740. Source: OSTI; NTIS (US Sales Only); INIS.

Both of graduate and post-graduate levels syllabus in chemistry of all universities and higher education institutes in Thailand consists of nuclear and radiochemistry topics, but not many universities/higher education institutes offer laboratory exercises to students. One of the reasons is due to the lack of radioactive materials and apparatus needed for this type of experiments. This paper will discuss on some nuclear and radiochemistry practices using easily available materials/apparatus. The experiments have been developed here. They include, for example, (1) volume determination, (2) detergency efficiency, (3) estimation of potassium contents in a fertilizer, (4) solvent extraction to separate the daughters of ^{238}U from a uranium compound and (5) chemical change of K_2CrO_4 after neutron irradiation.

4 refs.; 2 figs.; 1 tab.

For the first time the chemical identification of element 106 has been accomplished. In comparative gas thermochromatographic studies of (oxo) chlorides of element 106 and of Tungsten reproducible groups of tracks of fission fragments from s.f. of ^{263} 106 were observed in a temperature region of 150-250^0 C. This provides evidence that element 106 oxo chloride is similar to the Tungsten compounds. Elements 104, 105 and actinides do not yield volatile compound under the particular experimental conditions. 4 refs.; 2 figs.; 1 tab.

10500 (RCM–00994) **Chemical reactions of actinides with groundwater colloids. Studies of transferability of laboratory data to natural conditions. The aquiferous system in Gorleben. Interim report. Reported period: 1.2.1993-31.12.1993.** Zeh, P.; Kim, J.I. Technische Univ. Muenchen, Garching (Germany). Inst. fuer Radiochemie. 1994. 178p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 02E85833. Order Number DE95752183. Source: OSTI; NTIS (US Sales Only); INIS.

This study deals with the chemical interreaction between actinides and groundwater-colloids in selected aquiferes in the overburden of the planned final storage site for radioactive matter near Gorleben (Lower Saxony). As colloids have other transport properties than dissolved metal ions the interaction of actinides and groundwater-colloids has an important influence on their migration and is therefore essentially important for longterm-safety analyses. In order to study interaction of actinides with groundwater-colloids selected groundwaters were conditioned with trace concentrations of the actinides TH, Np, Pu, Am and Cm. For hexavalent actinides one used the analytical data of natural uranium in the groundwaters. In order to determine the humic-colloid-bound parts of the actinides the conditioned ground waters were filtered with a pore width of 1 nm and actinide concentration was determined with radiometry. (orig./EF)

10501 (RCM–01094) **Chemical behaviour of trivalent and pentavalent americium in saline NaCl-solutions. Studies of transferability of laboratory data to natural conditions. Interim report. Reported period: 1.2.1993-31.12.1993.** Runde, W.; Kim, J.I. Technische Univ. Muenchen, Garching (Germany). Inst. fuer Radiochemie. Sep 1994. 236p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 02E85833. Order Number DE95752244. Source: OSTI; NTIS (US Sales Only); INIS.

In order to clarify the chemical behaviour of Americium in saline aqueous systems relevant for final storage this study deals with the chemical reactions of trivalent and pentavalent Americium in NaCl-solutions under the influence of radiolysis from its own alpha radiation. The focus of the study was on investigating the geologically relevant reactions, such as hydrolysis or carbonate- and chloride complexing in solid-liquid equilibriums. Comprehensive measurements on solubility and spectroscopic studies in NaCl-solutions were carried out in a CO_2-free atmosphere and 10^{-2} atm CO_2 partial pressure. Identification and characterisation of the AM (III) and AM(V) solid phases were supplemented by structural research with the chemically analogue EU (III) and Np(V) compounds. The alpha-radiation induced radiolysis in saline NaCl solutions and the redox behaviour of Americium which was influenced thereby were spectroscopically quantified. (orig.)

The R and D activities presently focus on thermal waste treatment methods with emphasis on the classical waste incineration process. Pollution balances and technical studies of the reduction of flue gas pollution burdens are prepared for the latter. The design of combustion chambers, the air conduction system, temperatures in the combustion chamber and secondary combustion chamber, and temperature range sojourn times decide on the destruction of the organic components, the immobilization of the heavy-metal fractions in the slags, and the conversion of particulate or gaseous pollutants into precipitable substances. Cyclones are used for flue gas purification, electrostatic filters and fabric filters are used for fly ash precipitation, and scrubbers are used for the absorption of noxious gases. To minimize organic pollutant emissions the previous flue gas purification concepts must be extended by additional process stages or be replaced by simultaneous procedures such as adsorptive and catalytic-oxidative methods. (orig.)

10504 (LUTVDG-TVBB–1010) **Simulation of combustion and fire-induced flows in enclosures.** Tuovinen, H. Lund Univ. (Sweden). Dept. of Fire Safety Engineering. 24 Jan 1995. 147p. Order Number DE95744965. Source: OSTI; NTIS.

Numerical modelling of combustion in flames and gas flows generated by fires in compartments has been carried out. The laminar flamelet model has been used to model combustion in different degrees of vitiation in order to model fire gas re-circulation which occurs in compartment fires. Computational fluid dynamics (CFD) modelling has been used in the calculation of the flow field. The flamelet calculations were carried out using a modified version of the Cranfield SNECKS code and CFD calculations using the Fire Research Station's JASMINE code. The results from both flamelet and CFD calculations agree reasonably with experimental results. Generally, the deviations from laboratory measurements are less than 30 percent, which is not greater than the errors expected in the measurement. 74 refs, 31 figs, 2 tabs

42 ENGINEERING

10505 (SAND–95-8206) **Passive micromechanical tags. An investigation into writing information at nanometer resolution on micrometer size objects.** Schmieder, R.W.; Bastasz, R.J. Sandia National Labs., Livermore, CA (United States). Jan 1995. 188p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95007550. Source: OSTI; NTIS; INIS; GPO Dep.

The authors have completed a 3-year study of the technology related to the development of micron-sized passive micromechanical tags. The project was motivated by the discovery in 1990 by the present authors that low energy, high charge state ions (e.g., Xe^{+44}) can produce nanometer-size damage sites on solid surfaces, and the realization that a pattern of these sites represents information. It was envisioned that extremely small, chemically inert, mechanical tags carrying a large label could be fabricated for a variety of applications, including tracking of controlled substances, document verification, process control, research, and engineering. Potential applications exist in the data storage, chemical, food, security, and other industries. The goals of this project were fully accomplished, and they are fully documented here. The work was both experimental and developmental. Most of the experimental effort was a search for appropriate tag materials. Several good materials were found, and the upper limits of information density were determined (ca. 10^{12} bit/cm^2). Most of the developmental work involved inventing systems and strategies for using these tags, and compiling available technologies for implementing them. The technology provided herein is application-specific: first, the application must be specified, then the tag can be developed for it. The project was not intended to develop a single tag for a single application or for all possible applications. Rather, it was meant to provide the enabling technology for fabricating tags for a range of applications. The results of this project provide sufficient information to proceed directly with such development.

"Safer, better, cheaper" are recurring themes in many robot development efforts. Significant improvements are being accomplished with existing technology, but basic research sets the foundations for future improvements and breakthrough discoveries. Advanced robots represent systems that integrate the three basic functions of sensing, reasoning, and acting (locomotion and manipulation) into one functional unit. Depending on the application requirements, some of these functions are implemented at a more or less advanced level than others. For example, some navigation tasks can be accomplished with purely reactive control and do not require sophisticated reasoning and planning methodologies. Robotics work at the Oak Ridge National Laboratory (ORNL) spans the spectrum from basic research to application-specific development and rapid prototyping of systems. This presentation summarizes recent highlights of the robotics research activities at ORNL.

10507 (DOE/MC/29115–95/C0415) **An intelligent inspection and survey robot.** Byrd, J.; Holland, J.M. South Carolina Universities Research, Clemson, SC (United States). [1995]. 9p. ARIES (Autonomous Robotic Inspection Experimental System) is a semi-autonomous robotic system intended for use in the automatic inspection of stored containers of low level nuclear waste. The project is being performed by a team under the SCUREF (South Carolina University Research and Education Foundation) comprised of the University of South Carolina, and Clemson University, and their industrial partner Cybermotion Inc., with funding from METC, Morgantown, WV. The ARIES program is unusual in the level of cooperation between the universities and Cybermotion. By maintaining daily communications via telephone and E-Mail, participating in frequent meetings with each other and the end users, and by developing an open flow of (sometimes sensitive) technical information, the team has been able to build on a very broad base of intellectual strengths and existing technology without wasteful duplication. This base includes all of the navigation and control software and hardware developed by Cybermotion over nearly a decade and the deep technology resources of the university partners. It is anticipated that the result will be a technically advanced system that is much closer to a deployable configuration than is typical for this stage of research. In this decade of shrinking budgets, such relationships can provide a crucial advantage for all participants.

10508 (EGG-M–94370) **Spray-formed tooling.** McHugh, K.M.; Key, J.F. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570 ; AC07-94ID13223. (CONF-9410256–3: Society of Automotive Engineers' convergence '94, Detroit, MI (United States), 18-27 Oct 1994). Order Number DE95005031. Source: OSTI; NTIS; GPO Dep.

The United States Council for Automotive Research (USCAR) has formed a partnership with the Idaho National Engineering Laboratory (INEL) to develop a process for the rapid production of low-cost tooling based on spray forming technology developed at the INEL. Phase 1 of the program will involve bench-scale system development, materials characterization, and process optimization. In Phase 2, prototype systems will be de signed, constructed, evaluated, and optimized. Process control and other issues that influence commercialization will be addressed during this phase of the project. Technology transfer to USCAR, or a tooling vendor selected by USCAR, will be accomplished during Phase 3. The approach INEL is using to produce tooling, such as plastic injection molds and stamping dies, combines rapid solidification processing and net-shape materials processing into a single step. A bulk liquid metal is pressure-fed into a de Laval spray nozzle transporting a high velocity, high temperature inert gas. The gas jet disintegrates the metal into fine droplets and deposits them onto a tool pattern made from materials such as plastic, wax, clay, ceramics, and metals. The approach is compatible with solid freeform fabrication techniques such as stereolithography, selective laser sintering, and laminated object manufacturing. Heat is extracted rapidly, in-flight, by convection as the spray jet entrains cool inert gas to produce undercooled and semi-solid droplets. At the pattern, the droplets weld together while replicating the shape and surface features of the pattern. Tool formation is rapid; deposition rates in excess of 1 ton/h have been demonstrated for bench-scale nozzles.

There are a number of high-quality techniques for distribution mains renewal involving polyethylene pipes inserted into the existing lines. The technique was originally developed for grey cast iron pipes but is increasingly being used for steel lines in Germany, as large number of the 130,000 km of steel gas lines would have to be refurbished in the medium term. Under the refurbishment program, all existing service pipes must be connected to the new internal PE pipe. Connecting new service lines to distribution mains after rehabilitation is more difficult as this involves removing the top half of the old pipe at the tie-in point and care must be taken not to cause mechanical or thermal damage to the inside PE pipe. For this work, 'diga rohrtechnik gmbh' has developed a machine based on a simple principle: along the circumference line of the piece of pipe to be removed (top half of a pipe section) a groove is cut into the pipe wall, reducing the thickness to about 0.5 mm. The cut-out can then be removed with a standard device. (orig.)

Pre-conference paper.

The recognition of the technical capability of a testing laboratory is carried out by Laboratory Accreditation Bodies as the result of a satisfactory evaluation and the systematic follow up of the certified qualification. In Argentina the creation of a National Center for the Accreditation of Testing Laboratories, as a first step to assess a National Accreditation System is currently projected. CNEA, as an institution involved in technological projects and in the development and production of goods and services, has adopted since a long time ago quality assurance criteria. One of their requirements is the qualification of laboratories. Due to the lack of a national system, a Committee for the Qualification of Laboratories was created jointly by the Research and Development and Nuclear Fuel Cycle Areas with the responsibility of planning and management of the system evaluation and the certification of the quality of laboratories. The experience in the above mentioned topics is described in this paper. (author).

Formulation and verification of a mathematical model for the behaviour of a dynamic system is an essential step in evaluating the reliability of the system, in constructing a controller, and in other tasks. The model is verified by up-dating a preliminary model, based on measurements. Model up-dating of a dynamical system is an inverse problem whose severity tends to increase with.the dimension of the system. selective sensitivity is method for partitioning the identification of a large linear elastic vibrational system into many low-dimensional estimation problems. A major practical limitation of selective? sensitivity in its previous formulation is the need for data from numerous actuators. In this paper we show that selectively-sensitive analysis can be made with modal data, and that the main instrumental limitation is the number of sensors rather than actuators.

10515 (JAERI-Data/Code–94-018) **Analyses with MCNP code of the criticality experiment of pellet-solution coexisting low-enriched uranium fuel.** Kobayashi, Tomoya (Toyohashi Univ. of Technology, Aichi (Japan)); Arakawa, Takuya; Okuno, Hiroshi. Japan Atomic Energy Research Inst., Tokyo (Japan). Dec 1994. 41p. (In Japanese). Order Number DE95747906. Source: OSTI; NTIS; INIS.

Using the continuous energy Monte Carlo code MCNP-4A with a combination of the evaluated nuclear data file JENDL-3.1, analyses have been made of the criticality experimental systems that were described as triangular arrays of 4.3wt% ^{235}U-enriched uranium dioxide rods partially immersed in uranyl nitrate solution of the same ^{235}U enrichment containing soluble gadolinium. The calculated neutron multiplication factors have had an average of 0.955. The reason to have such a smaller value than unity has been estimated to be mainly attributed to incorrect compositions of fuel solution and so on that were reported. Therefore, the specification of the international benchmark exercises proposed by OECD/NEA have been accepted for the composition of fuel pellet, fuel solution, stainless steel and gadolinium, as it has been considered they had supplied more appropriate values than originally reported after examination of the composition data, to calculate the neutron multiplication factors, which has resulted in an average of 0.986, fairly approached unity. (author).

10516 (LA-UR–93-3760-Rev.) **Glossary of formal operations.** Cort, G.; Donahue, S.; Frank, J.; Perkins, B.; Wrye, J. Los Alamos National Lab., NM (United States). 5 Jan 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95005582. Source: OSTI; NTIS; GPO Dep.

The purpose of this document is to establish definitions for the terms used in the planning, development, and implementation of a formal operations program at Los Alamos National Laboratory.

10517 (LA-UR–94-3741) **An examination of assumptions underlying the state of the art in injection molding modeling.** Guell, D.C.; Lovalenti, P.M. Los Alamos National Lab., NM (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9505114–1: ANTEC '95, Boston, MA (United States), 7-11 May 1995). Order Number DE95003725. Source: OSTI; NTIS; GPO Dep.

The purpose of this paper is to place the modeling assumptions involved in injection molding filling simulation software in context by estimating and comparing the various errors associated with predicting the melt pressure within the cavity during filling. This is achieved by identifying specific sources of modeling, material property, and numerical errors and computing their relative magnitudes through simple scaling, or back-of-an-envelope, calculations. Thereby, the users of such software are provided with useful information for evaluating the expected accuracy of the solutions and for interpreting the output generated. The results presented shed additional light into the black box that mold filling simulations sometimes seem, much in the spirit as have previous examinations of issues such as convergence criteria and mesh density.

10518 (LA-UR–94-3960) **Micromechanical modeling of damage and inelasticity of composite materials in macroscopic structural analysis.** Macek, R.W. (Los Alamos National Lab., NM (United States)); Gardner, J.P.; Hackett, R.M. Los Alamos National Lab., NM (United States). [1994]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9505115–1: ASCE engineering mechanics conference, Boulder, CO (United States), 21-24 May 1995). Order Number DE95003666. Source: OSTI; NTIS; GPO Dep.

The method of cells has been extended to include damage or debonding between all adjacent subcells using a finite element formulation for the original cells assembly. Damage is implemented by placing a nonlinear three-dimensional spring between adjacent subcells. With this arrangement the damage is inherently anisotropic. The "nonlinear substructure" cells finite element model is incorporated as a user defined material routine in a general purpose finite element code. The primary motivation for casting the method of cells as a finite element assemblage is to provide a composite constitutive model that facilitates the incorporation of various constituent material models, as well as any level of detail desired in the microstructure geometry. At present, the constituent material models may be anisotropic elastic or isotropic viscoelastic-plastic, while damage evolution is based on the macroscopic strain. The capability of the model is demonstrated through analyses of some simple structures loaded to failure.

10519 (LA-UR–95-121) **FORTE antenna element and release mechanism design.** Rohweller, D.J. (Astro Aerospace Corp., Carpinteria, CA (United States)); Butler, T.Af. Los Alamos National Lab., NM (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9505173–1: Aerospace mechanisms symposium, Sunnyvale, CA (United States), 17-19 May 1995). Order Number DE95006294. Source: OSTI; NTIS; GPO Dep.

The Fast On-Orbit Recording of Transient Events (FORTE) satellite being built by Los Alamos National Laboratory (LANL) and Sandia National Laboratories (SNL) has as its most prominent feature a large deployable (11 m by 5 m) log periodic antenna to monitor emissions from electrical storms on the Earth. This paper describes the antenna and the design for the long elements and explains the dynamics of their deployment and the damping system employed. It also describes the unique paraffin-actuated reusable tie-down and release mechanism employed in the system.

10520 (ORNL/TM–12876) **Jet mixing long horizontal storage tanks.** Perona, J.J.; Hylton, T.D.; Youngblood, E.L.; Cummins, R.L. Oak Ridge National Lab., TN (United States). Dec 1994. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95006797. Source: OSTI; NTIS; INIS; GPO Dep.

Large storage tanks may require mixing to achieve homogeneity of contents for several reasons: prior to sampling for mass balance purposes, for blending in reagents, for suspending settled solids for removal, or for use as a feed tank to a process. At ORNL, mixed waste evaporator concentrates are stored in 50,000-gal tanks, about 12 ft in diameter and 60 ft long. This tank configuration has the advantage of permitting transport by truck and therefore fabrication in the shop rather than in the field. Jet mixing experiments were carried out on two model tanks: a 230-gal (1/6-linear-scale) Plexiglas tank and a 25,000-gal tank (about 2/3 linear scale). Mixing times were measured using sodium chloride tracer and several conductivity probes distributed through the tanks. Several jet sizes and configurations were tested. One-directional and two-directional jets were tested in both tanks. Mixing times for each tank were correlated with the jet Reynolds number. Mixing times were correlated for the two tank sizes using the recirculation time for the developed jet. When the recirculation times were calculated using the distance from the nozzle to the end of the tank as the length of the developed jet, the correlation was only marginally successful. Data for the two tank sizes were correlated empirically using a modified effective jet length expressed as a function of the Reynolds number raised to the 1/3 power. Mixing experiments were simulated using the TEMTEST computer program. The simulations predicted trends correctly and were within the scatter of the experimental data with the lower jet Reynolds numbers. Agreement was not as good at high Reynolds numbers except for single nozzles in the 25,000-gal tank, where agreement was excellent over the entire range.

10521 (PNL–10045) **Benchmark data for validating irradiated fuel compositions used in criticality calculations.** Bierman, S.R.; Talbert, R.J. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95002581. Source: OSTI; NTIS; INIS; GPO Dep.

To establish criticality safety margins utilizing burnup credit in the storage and transport of spent reactor fuels requires a knowledge of the uncertainty in the calculated fuel composition used in making the reactivity assessment. To provide data for validating such calculated burnup fuel compositions, radiochemical assays have been obtained as part of the United States Department of Energy Form-Reactor Cask Development Program. Assay results and associated operating histories on the initial three samples analyzed in this effort are presented. The three samples were taken from different axial regions of a Pressurized Water Reactor fuel rod and represent radiation exposures of about 37, 27, and 44 GWd/MTU. The data are presented in a benchmark type format to facilitate identification/referencing and computer code input.

10522 (PNL-SA–25159) **Micro manipulator motion control to counteract macro manipulator structural vibrations.** Lew, J.Y.; Trudnowski, D.J.; Evans, M.S.; Bennett, D.W. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950232–17: 6. American Nuclear Society meeting on robotics and remote systems, Monterey, CA (United States), 5-10 Feb 1995). Order Number DE95007282. Source: OSTI; NTIS; GPO Dep.

Inertial force damping control by micro manipulator modulation is proposed to suppress the vibrations of a micro/macro manipulator system. The proposed controller, developed using classical control theory, is added to the existing control system. The proposed controller uses real-time measurements of macro manipulator flexibility to adjust the motion of the micro manipulator to counteract structural vibrations. Experimental studies using an existing micro/macro flexible link manipulator testbed demonstrate the effectiveness of the proposed approach to suppression of vibrations in the macro/micro manipulator system using micro-manipulator-based inertial active damping control.

10523 (SAND–94-2082C) **The effects of finite element grid density on model correlation and damage detection of a bridge.** Simmermacher, T. (Sandia National Labs., Albuquerque, NM (United States)); Mayes, R.L.; Reese, G.M.; James, G.H.; Zimmerman, D.C. Sandia National Labs., Albuquerque, NM (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950444–1: AIAA adaptive structures conference, New Orleans, LA (United States), 13-14 Apr 1995). Order Number DE94018895. Source: OSTI; NTIS; GPO Dep.

Variation of model size as determined by grid density is studied for both model refinement and damage detection. In model refinement 3 it is found that a large model with a fine grid is preferable in order to achieve a reasonable correlation between the experimental response and the finite element model. A smaller model falls victim to the inaccuracies of the finite element method. As the grid become increasing finer, the FE method approaches an accurate representation. In damage detection the FE method is only a starting point. The model is refined with a matrix method which

doesn't retain the FE approximation, therefore a smaller model that captures most of the dynamics of the structure can be used and is preferable.

10524 (SAND–94-2578) **Integrated structural control design of large space structures.** Allen, J.J.; Lauffer, J.P. Sandia National Labs., Albuquerque, NM (United States). [1995]. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95005441. Source: OSTI; NTIS; GPO Dep.

Active control of structures has been under intensive development for the last ten years. Reference 2 reviews much of the identification and control technology for structural control developed during this time. The technology was initially focused on space structure and weapon applications; however, recently the technology is also being directed toward applications in manufacturing and transportation. Much of this technology focused on multiple-input/multiple-output (MIMO) identification and control methodology because many of the applications require a coordinated control involving multiple disturbances and control objectives where multiple actuators and sensors are necessary for high performance. There have been many optimal robust control methods developed for the design of MIMO robust control laws; however, there appears to be a significant gap between the theoretical development and experimental evaluation of control and identification methods to address structural control applications. Many methods have been developed for MIMO identification and control of structures, such as the Eigensystem Realization Algorithm (ERA), Q-Markov Covariance Equivalent Realization (Q-Markov COVER) for identification; and, Linear Quadratic Gaussian (LQG), Frequency Weighted LQG and H-/ii-synthesis methods for control. Upon implementation, many of the identification and control methods have shown limitations such as the excitation of unmodelled dynamics and sensitivity to system parameter variations. As a result, research on methods which address these problems have been conducted.

10525 (SAND–94-3128C) **Graph certificates, lookahead in dynamic graph problems, and assembly planning in robotics.** Khanna, S. (Stanford Univ., CA (United States)); Motwani, R.; Wilson, R.H. Sandia National Labs., Albuquerque, NM (United States). [1994]. 14p. Sponsored by Schlumberger Foundation (United States);Shell Companies Foundation, Inc., New York, NY (United States);Stanford Integrated Mfg. Association (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505156–1: Symposium on theory of computing, Atlanta, GA (United States), 29 May - 1 jun 1995). Order Number DE95006304. Source: OSTI; NTIS; GPO Dep.

Despite intensive efforts in the area of dynamic graph algorithms, no efficient algorithms are known for the dynamic versions of some basic graph problems such as strong connectivity and transitive closure. We provide some explanation for this lack of success by presenting quadratic lower bounds on the strong certificate complexity of such problems, thereby establishing the inapplicability of the only known general technique for designing dynamic graph algorithms, viz., sparsification. These results also provide evidence of the inherent intractability of such dynamic graph problems. Some of our results are based on a general technique for obtaining lower bounds on the strong certificate complexity for a class of graph properties by establishing a relationship with the witness complexity. In many real applications of dynamic graph problems, a certain amount of lookahead is available. Specifically, we consider the problems of assembly planning in robotics and the maintenance of relations in databases which, respectively, give rise to dynamic strong connectivity and transitive closure. We exploit the (naturally available) lookahead in these two applications to circumvent the inherent complexity of the dynamic graph problems. We propose a variant of sparsification, viz., lookahead based sparsification, and apply it to obtain the first efficient fully dynamic algorithms for strong connectivity and transitive closure.

10526 (SAND–95-0139C) **Vibration suppression of fixed-time jib crane maneuvers.** Parker, G.G.; Petterson, B.; Dohrmann, C.R.; Robinett, R.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950228–1: North American conference on smart structures and materials, San Diego, CA (United States), 26 Feb - 3 mar 1995). Order Number DE95006824. Source: OSTI; NTIS; GPO Dep.

A jib crane consists of a pendulum-like end line attached to a rotatable jib. Within this general category of cranes there exist devices with multiple degrees of freedom including variable load-line length and variable jib length. These cranes are commonly used for construction and transportation applications. Point-to-point payload maneuvers using jib cranes are performed so as not to excite the spherical pendulum modes of their cable and payload assemblies. Typically, these pendulum modes, although time-varying, exhibit low frequencies. The resulting maneuvers are therefore performed slowly, contributing to high construction and transportation costs. The crane considered here consists of a spherical pendulum attached to a rigid jib. The other end of the jib is attached to a direct drive motor for generating rotational motion. A general approach is presented for determining the open-loop trajectories for the jib rotation for accomplishing fixed-time, point-to-point, residual oscillation free, symmetric maneuvers. These residual oscillation free trajectories purposely excite the pendulum modes in such a way that at the end of the maneuver the oscillatory degrees of freedom are quiescent. Simulation results are presented with experimental verification.

10527 (SAND–95-8444C) **A conceptual design methodology for enhanced conformance quality.** Hinckley, C.M. (Sandia National Labs., Livermore, CA (United States)); Barkan, P. Sandia National Labs., Livermore, CA (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-950392–1: National design engineering conference, Chicago, IL (United States), 13-16 Mar 1995). Order Number DE95004383. Source: OSTI; NTIS; GPO Dep.

Traditional manufacturing practice has depended upon Statistical Process Control (SPC) to eliminate defects. However, our research demonstrates that these sampling based methods significantly underestimate the tails of a distribution. As a consequence of the limitations of SPC, mistakes require different methods of control to achieve defect rates in the tens of parts per million range. Furthermore, product complexity contributes to defects resulting from both mistakes and excess variation. Correlations between defects and complexity lead to a new opportunity for selecting superior product concepts.

10528 (UCRL-JC–118566) **Computational studies of projectile melt in impact with typical whipple shields.** Rhoades, C.E. Jr. (Lawrence Livermore National Lab., CA (United States)); Alme, M.L. Lawrence Livermore National Lab., CA (United States). Dec 1994. 9p. Sponsored by USDOE, Washington, DC (United States);National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9410254–4: Nuclear explosives code developers conference (NECDC), Las Vegas, NV (United States), 27 Oct 1994). Order Number DE95005916. Source: OSTI; NTIS; GPO Dep.

Protecting space-based structures against the impact of orbital debris is an important problem of current interest. This paper presents scaling results based on simulations with the CALE computer program of aluminum projectile impacting typical aluminum Whipple shields at speeds of 6 to 14 km/s. The objective was to determine the extent of projectile and shield material melting. The approach was to perform a matrix of computer simulations varying the impact speed from 6 to 14 km/s and varying the areal density of the shield from 5 percent to 80 percent of the centerline areal density of the projectile. The projectile radius was fixed at 9.5 mm (mass = 1.27 grams). The melt state of the projectile material and the shield material was assessed after release of the initial shock. The post-release specific energy in the projectile and in the shield was compared with the enthalpy of incipient melt and the enthalpy of complete melt provided in the Hultgren Tables. Material with specific energy greater than the enthalpy of complete melt was assumed to be fully melted. Material with specific energy greater than the enthalpy of incipient melt but less than that of complete melt was assumed to be partially solid and partially melted mixed phase material with no strength. Material with specific energy less than the enthalpy of incipient melt was assumed to be in a solid state

with strength. It is likely that this solid material is in a highly fragmented state as a result of the initial shock.

10529 (WHC-SD-L205-ATP–001) **Fire alarm system.** Koehling, E. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005607. Source: OSTI; NTIS; INIS; GPO Dep.

This test procedure is the documentation for the testing of the 4 fire alarm bells which rewired during the remodeling of the Emergency Operations Center in the Richland, Washington, Federal Office Building.

10530 (WHC-SD-SNF-CR–001) **Design criteria document, electrical system, K-Basin essential systems recovery, Project W-405.** Hoyle, J.R. Westinghouse Hanford Co., Richland, WA (United States). 12 Dec 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005217. Source: OSTI; NTIS; INIS; GPO Dep.

This Design Criteria Document provides the criteria for design and construction of electrical system modifications for 100K Area that are essential to protect the safe operation and storage of spent nuclear fuel in the K-Basin facilities.

10531 (WHC-SD-SQA-CSA–20376) **CSER 94-011: Use of glovebags for demister draining operations.** Hess, A.L. Westinghouse Hanford Co., Richland, WA (United States). 12 Dec 1994. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005167. Source: OSTI; NTIS; INIS; GPO Dep.

A criticality safety review is presented for the use of plastic-sheet glovebags for the operations of draining demisters on the 26-inch vacuum system headers. A criticality drain is required because of the possibility for spilling liquid of sufficient volume and fissile content for criticality. It is recommended that the glovebag design include a rigid, 2ft x 2ft floor with a central drain feeding a geometrically favorable spill-catch vessel, plus a screen grid above the bottom for drain protection.

10532 (WHC-SD-SQA-CSWD–30017) **ANACAP-U software configuration and installation verification on the SECC.** Marlow, R.S. Westinghouse Hanford Co., Richland, WA (United States). 27 Sep 1994. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006829. Source: OSTI; NTIS; GPO Dep.

ANACAP-U is a preprocessor, postprocessor, and concrete material subroutine used for the analysis of concrete structures. ANACAP-U functions in concert with the ABAQUS general purpose finite-element code. This document describes the Quality Assurance process for ANACAP-U version 9-2.2.7 as installed on the SECC.

10533 (WHC-SD-TD-WP–0050) **LDUA engineering development plan.** Engstrom, J.W. Westinghouse Hanford Co., Richland, WA (United States). 15 Sep 1994. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005285. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides guidance to perform Light Duty Utility Arm (LDUA) development work and documentation required to validate the design of the LDUA System.The LDUA system will be used to deploy various types of sensors and devices to demonstrate the technology and qualify the integrated systems for operational use in the Hanford single shell tanks to characterize the waste inside and assess tank integrity.

10534 (WHC-SD-TP-DAP–006) **Documentation and analysis for packaging limited quantity ice chests.** Nguyen, P.M. Westinghouse Hanford Co., Richland, WA (United States). 31 Jan 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006831. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this Documentation and Analysis for Packaging (DAP) is to document that ice chests meet the intent of the International Air Transport Association (IATA) and the U.S. Department of Transportation (DOT) Code of Federal Regulations as strong, tight containers for the packaging of limited quantities for transport. This DAP also outlines the packaging method used to protect the sample bottles from breakage. Because the ice chests meet the DOT requirements, they can be used to ship LTD QTY on the Hanford Site.

10535 (WHC-SD-TP-SEP–026) **Safety Evaluation for Packaging 101-SY Hydrogen Mitigation Mixer Pump package.** Carlstrom, R.F. Westinghouse Hanford Co., Richland, WA (United States). 5 Oct 1994. 389p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002079. Source: OSTI; NTIS; INIS; GPO Dep.

This Safety Evaluation for Packaging (SEP) provides analysis and considered necessary to approve a one-time transfer of the 101-SY Hydrogen Mitigation Mixer Pump (HMMP). This SEP will demonstrate that the transfer of the HMMP in a new shipping container will provide an equivalent degree of safety as would be provided by packages meeting US Department of Transportation (DOT)/US Nuclear Regulatory Commission (NRC) requirements. This fulfills onsite, transportation requirements implemented by WHC-CM-2-14.

10536 (WHC-SD-TP-TP–005) **Pig shipping container test sequence.** Adkins, H.E. Jr. Westinghouse Hanford Co., Richland, WA (United States). 13 Jan 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95006875. Source: OSTI; NTIS; INIS; GPO Dep.

This test plan outlines testing of the integrity of the pig shipping container. It is divided into four sections: (1) drop test requirements; (2) test preparations; (3) perform drop test; and (4) post-test examination.

10537 (WHC-SD-WM-ANAL–038) **Analysis of K-1 fan system for replacement of valve actuator, B Plant/Waste Encapsulation and Storage Facility.** Burgess, J.S. Westinghouse Hanford Co., Richland, WA (United States). 4 Jan 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005605. Source: OSTI; NTIS; INIS; GPO Dep.

Components of the K-1 fan system were evaluated for structural adequacy to accommodate an actuator weighing 540 lbs. The components evaluated were the connectors between the actuator and the valve, the duct between the valve and the facility wall, and the stud anchors connecting the duct to the facility wall. The loads were deadload, snow, operating loads, and seismic loads. The components were found to be structurally adequate for these loads.

10538 (WHC-SD-WM-ATR–110) **Acceptance test report for the link belt LS-518 crane hook position/rate indication system.** Aftanas, B.L. Westinghouse Hanford Co., Richland, WA (United States). 29 Dec 1994. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005224. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance Test Report (ATR) is for the Link Belt LS-518 Crane Hook Position/Rate Indication System.

10539 (WHC-SD-WM-TC–054) **Verification/acceptance test plan/procedure for Acromag calibration system.** Fordham, C.R. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005682. Source: OSTI; NTIS; GPO Dep.

The purpose of this document is to describe and document the test of the Acromag calibration system software. The purpose of this test is to verify that the Acromag Calibration System (ACS) will reliably test the Acromag thermocouple (TC) type input modules and provide a file showing the temperatures at which the modules are tested, the response rom the Acromag station, instrument data, technician data, and date and time of the test. The ACS consists of a thermocouple calibration unit (TCU), a DOS based computer, a hand held resistance temperature detector (RTD) surface probe and connects to a field installed or a bench Acromag unit.

10540 (DLR-FB–94-20) **Experimental investigation of turbulent particle dispersion in swirling flows.** Hassa, C. (Deutsche Forschungsanstalt fuer Luft- und Raumfahrt e.V. (DLR), Koeln (Germany). Inst. fuer Antriebstechnik). Deutsche Forschungsanstalt fuer Luft- und Raumfahrt e.V. (DLR), Koeln (Germany). Abt. Operative Planung; Bochum Univ. (Germany). Fakultaet fuer Maschinenbau. 1994. 156p. (In German). Order Number DE95745847. Source: OSTI; NTIS (US Sales Only).

The turbulent particle dispersion is investigated with regard to the two-phase flow of fuel spray and combustion air in gas turbine combustion chambers. For that purpose, an atmospheric isothermal experiment is presented, that allows the verification of mathematical models for the calculation of turbulent two-phase flows by virtue of the application of nonintrusive measuring techniques and the similarity of its flow configuration to the practical flow. The basic configuration of the gas flow is an axisymmetric, expanding swirl flow with a practical swirl strength and expansion ratio. By using a monodisperse droplet generator, the investigation of turbulent dispersion was separated from atomization. For the gaseous phase, mean and fluctuating velocities as well as Eulerian integral time scales have been measured. The droplet-phase is documented by the measurement of droplet-flux density, velocity and ensemble rms velocity. (orig.)

10541 (DOE/ER/12933–T1) **Film boiling on spheres in single- and two-phase flows. Final report.** Liu, C.; Theofanous, T.G. California Univ., Santa Barbara, CA (United States). Dept. of Chemical and Nuclear Engineering. Dec 1994. 259p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER12933. Order Number DE95005453. Source: OSTI; NTIS; GPO Dep.

Film boiling on spheres in single- and two-phase flows was studied experimentally and theoretically with an emphasis on establishing the film boiling heat transfer closure law, which is useful in the analysis of nuclear reactor core melt accidents. Systematic experimentation of film boiling on spheres in single-phase water flows was carried out to investigate the effects of liquid subcooling (from 0 to 40°C), liquid velocity (from 0 to 2 m/s), sphere superheat (from 200 to 900°C), sphere diameter (from 6 to 19 mm), and sphere material (stainless steel and brass) on film boiling heat transfer. Based on the experimental data a general film boiling heat transfer correlation is developed. Utilizing a two-phase laminar boundary-layer model for the unseparated front film region and a turbulent eddy model for the separated rear region, a theoretical model was developed to predict the film boiling heat transfer in all single-phase regimes. The film boiling from a sphere in two-phase flows was investigated both in upward two-phase flows (with void fraction from 0.2 to 0.65, water velocity from 0.6 to 3.2 m/s, and steam velocity from 3.0 to 9.0 m/s) and in downward two-phase flows (with void fraction from 0.7 to 0.95, water velocity from 1.9 to 6.5 m/s, and steam velocity from 1.1 to 9.0 m/s). The saturated single-phase heat transfer correlation was found to be applicable to the two-phase film boiling data by making use of the actual water velocity (water phase velocity), and an adjustment factor of $(1-\alpha)^{1/4}$ (with α being the void fraction) for downward flow case only. Slight adjustments of the Reynolds number exponents in the correlation provided an even better interpretation of the two-phase data. Preliminary experiments were also conducted to address the influences of multisphere structure on the film boiling heat transfer in single- and two-phase flows.

10542 (DOE/ER/13528–8) **Two-phase potential flow. Progress report, July 1, 1993–June 1, 1994.** Wallis, G.B. Dartmouth Coll., Hanover, NH (United States). Thayer School of Engineering. Jun 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER13528. Order Number DE95006415. Source: OSTI; NTIS; INIS; GPO Dep.

Progress towards developing a mature science of two-phase potential flow is reported in five areas: Basic theorems; Results for ellipsoids; Properties of arrays of spheres; Trajectories of interacting spheres; and Unit cell models.

10543 (ENEA-RT-ERG–93-45) **Nonhomogeneous nonequilibrium heat transfer model for subcooled boiling of water in uniformly heated vertical tubes.** Barbaro, M. (ENEA, Bologna (Italy). Centro Ricerche Energia 'E. Clementel' - Area Nucleare). ENEA, Bologna (Italy). Centro Ricerche Energia 'E. Clementel' - Area Energia e Innovazione. Jan 1994. 31p. (RT/ERG–93-45). Order Number DE95749682. Source: OSTI; NTIS (US Sales Only).

A numerical method is developed to determine the thermal-hydraulic characteristics of forced convenction subcooled boiling of water in uniformly heated vertical tubes. The flow is described by the use of a set of conservation equations for mass, momentum and energy, written for liquid in the flow core and for liquid and vapour in the well-adjacent zone. Local thermodynamic disequilibrium is assumed with interphase transport properties expressed in terms of appropriate constructive relations. The resulting axial void profile has been compared, over the entire heated length, with steam and water data from various sources, covering a wide range of pressure, mass flux, surface heat flux and inlet subcooling. The analysis gives satisfactory agreement with experimental data.

10544 (GRS–109) **Calculation of the phase difference speed of water and steam in channels with different geometric borders/edges.** Sonnenburg, H.G. Gesellschaft fuer Anlagen- und Reaktorsicherheit (GRS) mbH, Koeln (Gemany); Technische Univ. Berlin (Germany). Fachbereich 6 - Physikalische und Angewandte Chemie. Jun 1994. 173p. (In German). Order Number DE95754095. Source: OSTI; NTIS (US Sales Only); INIS.

The two-phase flow is characterised by the speed difference of the steam and water phase. This speed difference mainly depends on the dimensions and the geometric shape of the flow paths. The description of accidents concerning the loss of coolants in the field of reactor safety research have got the task to calculate these speed differences for flow paths of the reactor. These flow paths are e.g. tubes of various diameters and with different vertical situations to the horizontal position, channels between fuel rod bundles and the ring basin of the pressure vessel/tube. Based on the drift flux theory an equation has been developed, that enables an evaluation of the start of flood correlation in order to calculate these speed differences. The start of flood correlation is available for the evaluation for most of the current paths in pressurised water reactors. It was proved, that the evaluation of start of flood correlation which are valid for signle cross sections lead to the calculation of the speed difference occuring at that point. This interconnection was verified with examples for vertical and horizontal tubes for a large range of pressure (0.1 .. 7.0 Mpa), of steam volume (0% .. 100%) and of diameter (0.01 m .. 0.85 m) as well as for the flow path between vertical fuel rod bundles. The developed equation offers the possibility to predict the speed difference for a flow path with any form of edge/border, provided that the start of flood correlation is available for this current path. (EMG)

10545 (IFE/KR/E–94/002) **Verification of the slip velocity obtained from the two-fluid model in PHOENICS.** Lindholm, D. Institutt for Energiteknikk, Kjeller (Norway). Oct 1994. 62p. Order Number DE95755141. Source: OSTI; NTIS.

The report presents a research project with the main objective of testing the treatment of phase slip in PHOENICS on various two-phase test cases. For spherical air bubbles rising the stagnant water, the slip can be determined from the governing equations to be equal to 0.268 m/s. This is based on the assumption that the convection and diffusion terms are negligible compared to the pressure, gravity and interphase friction terms. Four two-dimensional test cases have been examined using the two-fluid model implemented in PHOENICS v.2.0. The cases examined were: (1) two-phase flow in a vertical straight duct, (2) two-phase flow in a vertical duct with a backward-facing step, (3) as case (1), but where an orifice has been installed at the inlet and (4) separation of gas and liquid in a square box. In all cases gravity was acting against the main flow direction. Two of the test cases verified a slip equal to 0.268 m/s. In the two other cases, a recirculation zone was formed, and the slip in the vertical direction was found to deviate from the preliminary calculated value of 0.268 m/s. For such flow problems, the convection and diffusion terms can not be neglected in the determination of the slip velocity. 10 refs., 38 figs., 4 tabs.

10546 (IFE/KR/E–94/005) **The three phase low pressure flow facility at Institutt for energiteknikk.** Espedal, M. Institutt for Energiteknikk, Kjeller (Norway). Dec 1994. 58p. Order Number DE95755139. Source: OSTI; NTIS.

The report describes the three phase low pressure flow facility at Institutt for energiteknikk (Norway). The facility was built during 1993 and 1994, and was tailor made for experiments which are being performed in the PhD project titled Stratified flow of water, oil and gas in horizontal oil wells. The flow facility consists of a water and oil reservoir/separator, supply systems for water, oil and air including instruments for measuring the water, oil and air flow rates, an approximately 20 meter long test section which can be inclined 10 degrees (up and down sloping) from the horizontal, a preseparator at the end of the test section, and a water and oil return line to the liquid reservoir. The test section can be easily changed, and presently a 60 mm i.d. circular Perspex tube is used. Pressure cells used for measuring the pressure drop along the test section have been installed as well as Fast Closing Valves for shutting off part of the test section in order to measure the liquid fraction. Other instrumentation can easily be added. 21 figs., 2 tabs.

Order Number DE95619741. Source: OSTI; NTIS (US Sales Only); INIS.

The critical two-phase flow computerized simulation is made with the RELAP5 computer code. The methodology breaks the chocking process into one with either a two-phase inlet or a subcooled inlet. For two-phase flow the phases are assumed to be in thermal equilibrium. Thermal non-equilibrium is considered for subcooled upstream stagnation conditions. (authors); 6 refs., 3 figs.

10549 (KFK–5324) **Asymptotic solution for the far wake of a heated cylinder.** Griesbaum, R.; Ehrhard, P.; Mueller, U. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Angewandte Thermo- und Fluiddynamik (IATF). May 1994. 56p. (In German). Order Number DE95746204. Source: OSTI; NTIS (US Sales Only).

Based on the approximate solution for the liminar far wake of an isothermal cylinder, we derive a model for the far wake of a weakly-heated cylinder. Forced flow is upward against gravity, while the problem is considered to be two-dimensional and steady. A scaled version of boundary layer equations in conjunction with Boussinesq's approximation are the basis for an asymptotic expansion using the small parameter $\epsilon=1/\sqrt{Re}$. Two leading orders of this expansion are discussed. In a first order we find the well-known flow field associated with the linearized far wake of a cylinder in conjunction with a gaussian temperature profile resulting from heat input. There are, however, no buoyancy forces present in the momentum equation of this approximation. The second order accounts for nonlinearities of momentum and heat transport and includes buoyant effects. The typical properties of this heated far wake, as e.g. kinematic or thermal boundary layer thickness and velocity or temperature amplitudes are discussed in their functional dependancy on the parameters. The parameters considered are the Reynolds-number, the Pradtl-number, the Grashof-number, as well as geometry. (orig.)

10550 (LA-UR–95-42) **A laboratory scale supersonic combustive flow system.** Sams, E.C.; Zerkle, D.K.; Fry, H.A.; Wantuck, P.J. Los Alamos National Lab., NM (United States). [1995]. 16p. A laboratory scale supersonic flow system [Combustive Flow System (CFS)] which utilizes the gaseous products of methane-air and/or liquid fuel-air combustion has been assembled to provide a propulsion type exhaust flow field for various applications. Such applications include providing a testbed for the study of planar two-dimensional nozzle flow fields with chemistry, three-dimensional flow field mixing near the exit of rectangular nozzles, benchmarking the predictive capability of various computational fluid dynamic codes, and the development and testing of advanced diagnostic techniques. This paper will provide a detailed description of the flow system and data related to its operation.

10551 (LBL–36328) **The use of wavelet transforms in the solution of two-phase flow problems.** Moridis, G.J. (Lawrence Berkeley Lab., CA (United States)); Nikolaou, M.; You, Yong. Lawrence Berkeley Lab., CA (United States). Oct 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-950206–1: Symposium on reservoir simulation, San Antonio, TX (United States), 12-15 Feb 1995). Order Number DE95004688. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper we present the use of wavelets to solve the nonlinear Partial Differential.Equation (PDE) of two-phase flow in one dimension. The wavelet transforms allow a drastically different approach in the discretization of space. In contrast to the traditional trigonometric basis functions, wavelets approximate a function not by cancellation but by placement of wavelets at appropriate locations. When an abrupt chance, such as a shock wave or a spike, occurs in a function, only local coefficients in a wavelet approximation will be affected. The unique feature of wavelets is their Multi-Resolution Analysis (MRA) property, which allows seamless investigational any spatial resolution. The use of wavelets is tested in the solution of the one-dimensional Buckley-Leverett problem against analytical solutions and solutions obtained from standard numerical models. Two classes of wavelet bases (Daubechies and Chui-Wang) and two methods (Galerkin and collocation) are investigated. We determine that the Chui-Wang, wavelets and a collocation method provide the optimum wavelet solution for this type of problem. Increasing the resolution level improves the accuracy of the solution, but the order of the basis function seems to be far less important. Our results indicate that wavelet transforms are an effective and accurate method which does not suffer from oscillations or numerical smearing in the presence of steep fronts.

10552 (SAND–95-0012C) **Numerical simulation of laminar flow in a curved duct.** Lopez, A.R.; Oberkampf, W.L. Centaur Associates, Inc., Washington, DC (United States). [1995]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950130–6: 33. American Institute of Aeronautics and Astronautics (AIAA) aerospace sciences meeting, Reno, NV (United States), 9-12 Jan 1995). Order Number DE95005427. Source: OSTI; NTIS; GPO Dep.

This paper describes numerical simulations that were performed to study laminar flow through a square duct with a 900 bend. The purpose of this work was two fold. First, an improved understanding was desired of the flow physics involved in the generation of secondary vortical flows in three-dimensions. Second, adaptive gridding techniques for structured grids in three- dimensions were investigated for the purpose of determining their utility in low Reynolds number, incompressible flows. It was also of interest to validate the commercial computer code CFD-ACE. Velocity predictions for both non-adaptive and adaptive grids are compared with experimental data. Flow visualization was used to examine the characteristics of the flow though the curved duct in order to better understand the viscous flow physics of this problem. Generally, moderate agreement with the experimental data was found but shortcomings in the experiment were demonstrated. The adaptive

grids did not produce the same level of accuracy as the non-adaptive grid with a factor of four more grid points.

10553 (BNL–61295) **X-ray and neutron reflectivity.** Deutsch, M. (Bar Ilan Univ., Ramat Gan (Israel). Physics Dept.); Ocko, B.M. Brookhaven National Lab., Upton, NY (United States). 4 Oct 1994. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95006691. Source: OSTI; NTIS; INIS; GPO Dep.

The intensity of X-rays and neutrons reflected from an interface at near-grazing incidence depends sensitively on the refractive index profile normal to the interface. As the refractive index depends on the density, the measured reflectivity vs. incidence angle can be used to determine the Interfacial density profile with sub Å resolution. The density sampled is, however, different for the two probes. As neutrons interact with the atomic nuclei, they probe the scattering amplitude density profile of the nuclei. This amounts effectively to probing the average mass density profile, where the contribution of each atomic species is weighted by its nucleus-neutron interaction strength, which varies irregularly throughout the periodic table. X-rays, however, interact with the electronic charge and thus probe the total electronic density profile of the interface. The two probes provide, therefore, slightly different, though related, information on the interface structure. Since modern synchrotron X-ray sources are 5-6 orders of magnitude brighter than the best neutron sources, X-ray reflectivity measurements routinely achieve much higher resolutions and accuracies than their neutron counterparts. However, the magnetic interaction and the large variation of the neutron scattering length upon isotopic substitution renders neutron reflectivity a method-of-choice in special cases such as studies of surface magnetism and the adsorption of polymers at liquid and solid surfaces.

10554 (EGG-M–94170) **Laser ultrasonic generation at the surface of a liquid metal.** Walter, J.B. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Telschow, K.L.; Conant, R.J. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States);Department of the Interior, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9408208–1: Review of progress in quantitative nondestructive examination, Snowmass, CO (United States), 1-5 Aug 1994). Order Number DE95004999. Source: OSTI; NTIS; GPO Dep.

The noncontacting nature of laser-based ultrasonic measurement has made it attractive in many applications. While most applications thus far involve solid samples, molten metals encountered in some stages of metal processing appear well suited to this technique. Possible applications for liquid metals include locating and characterizing the liquid/solid interface; characterizing a surface layer, contaminant, or alloying constituent; and measuring the temperature of the sample surface or bulk. This work aimed to characterize laser generation of ultrasound in liquid metals to facilitate the development of techniques for these applications. This paper describes measurements of the angular distribution and energy dependence of laser-generated ultrasound in mercury at ambient temperature. Mercury was chosen as the model liquid metal because it is liquid at room temperature, and so should have negligible temperature gradients beyond those produced in the laser generation process, and because it exhibits a very shallow optical penetration depth. Brief descriptions about the theory of laser generation by thermoelastic and ablation sources at the surface of a liquid metal are included. Both thermoelastic expansion and ablation cause similar ultrasound generation in liquid metals when laser generated ultrasonic pulses are directed perpendicular to the surface of liquid metals. The ultrasonic pulse amplitude is proportional to the absorbed laser pulse energy for both mechanisms. The simple threshold model presented for ablation describes the transition from thermoelastic generation with the model's two parameters being material dependent. For mercury, ablation produces about 100 times larger ultrasonic pulse amplitudes than thermoelastic expansion and has a threshold of about 6 MW/square cm. Molten metals offer a good medium for studying ablation, since the surface is always refreshed and ablation, at least for mercury, dominates ultrasonic generation above the threshold.

10555 (FhG-IWM-W–1/94) **Characterisation of machined high-strength ceramic components. Final report.** Hollstein, T.; Pfeiffer, W.; Gallmann, M.; Wendland, K. Fraunhofer-Institut fuer Werkstoffmechanik, Freiburg im Breisgau (Germany). Jun 1994. 137p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). 10558 (SAND–94-1737C) **Trace contamination measurements using heavy ion backscattering spectrometry.** Knapp, J.A.; Banks, J.C.; Brice, D.K. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941144–47: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95005419. Source: OSTI; NTIS; INIS; GPO Dep.

Heavy Ion Backscattering Spectrometry (HIBS) is a tool for measuring surface contamination at levels much lower than previously achievable with ion beam analyses. Many areas of materials research and development require very low levels of impurities, with advanced microelectronics as the best example. HIBS uses low-energy, heavy ions for analysis, taking advantage of the increased backscattering yield which can be obtained from high Z ion beams at low energy. Background due to increased yield from the substrate is eliminated by a thin carbon foil as part of the detector,

with a thickness chosen to range out ions scattered from the substrate and allow only ions scattered from impurities heavier than the substrate to reach the detector. The authors research system, using 150-200 keV N^+ beams and a single time-of-flight detector optimized for large solid angle, has achieved a sensitivity ranging from $\sim 5 \times 10^{10}$ atoms/cm^2 for Fe to $\sim 1 \times 10^9$ atoms/cm^2 for Au on Si, without preconcentration. A stand-alone HIBS prototype which the authors have developed for SEMATECH is expected to reach detection limits of $\sim 5 \times 10^9$ atoms/cm^2 for Fe and $\sim 1 \times 10^8$ atoms/cm^2 for Au on Si. In this paper they discuss in detail the factors which affect sensitivity for HIBS.

Partitioning of $NaSO_4$ and $NaHSO_4$ between the liquid and vapor phases was measured at 300, 325 and 350°C by sampling both phases from a static platinum-lined autoclave. Sample compositions were determined by ion chromatography and acidimetric titrations. The solutions were buffered with either acid or base so that the volatility of individual species was determined. The molal thermodynamic partitioning constants were calculated by taking into account the mean stoichiometric activity coefficient in the liquid phase and the hydrolysis equilibrium constants. The vapor phase species were assumed to be neutral molecules with unit activity coefficients. The strong temperature dependence of the partitioning constant was treated by the isocoulombic method to obtain a linear dependence of the logarithm of the partitioning constant versus reciprocal temperature in Kelvin. A model is described for predicting the composition of the condensate in the water/steam cycle of power plants using drum boilers. Equilibrium between liquid and steam is assumed in the drum during boiling, and in the low pressure turbine on steam condensation. The model is based on the measured partitioning constants of HCl, NH_4Cl, NaCl, NaOH, H_2SO_4, $NaHSO_4$, $NaSO_4$ and NH_3, the hydrolysis of HSO_4^- and NH_4^+ and the ionic product of water. Two test cases are given to demonstrate the sensitivity of the pH of the first condensate to the concentrations of various anions relative to the corresponding sodium concentration in the drum. These calculations also indicate that very high concentrations of solutes can be achieved under certain conditions.

10563 (ETDE-DE–23, pp. 36-39) **New ideas for atmospheric burners. 'THERMOMAX linear' reduces NO_x emissions to less than 60 mg/kWh.** Berg, H.; Jannemann, T. Ruhrgas AG, Essen (Germany). Dec 1992. 45p. (In German). In *Ruhrgas forum. Edition 4. 1992. Reports from science and technology.* Order Number DE95745742. Source: OSTI; NTIS (US Sales Only).

Thanks of their simple design, the high reliability and their relatively low price, special-design gas-fired boilers fitted with atmospheric burners continue to play a significant role for natural gas use in the residential sector. In view of more stringent emission requirements, Ruhrgas AG began in mid 1989 to develop an atmospheric burner designed to achieve emission levels in the region of the far lower values for fan-assisted burners, without the use of NO_x reducing burner inserts. Design work was based on the experience gained from full-premixed, fan-assisted, multiport burners (THERMOMAX principle) and an optimum compromise between NO_x emissions, CO emissions, flame stability and burner control was found. For a nominal air number of approx. 0.8 and a surface loading of approx. 40W/cm^2, NO_x emissions were below 60 mg/kWh in a control range of 1:2. In order to allow for the frequent changes in temperature at the burner ports, the burner features two perforated and highly heat-resistant metal strips resting in guides and designed to accommodate thermal expansion. This new design which does not require additional complex accessories could be vital for the future of atmospheric burner technology. For the coming years, the 'THERMOMAX linear' could be an interesting alternative - also from a cost point of view - to the new fully-premixed, fan-assisted burner designs only used in relatively expensive appliances. 10564 (LA-UR–95-251) **Three-dimensional visualization of reactive flows in complex geometries.** Fairfield, M.S. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950439–5: SMS simulation multiconference: simulation as a critical technology, Phoenix, AZ (United States), 9-13 Apr 1995). Order Number DE95006332. Source: OSTI; NTIS; GPO Dep.

The visualization of fluid flows has become more challenging, as recent advancements in computational methods have increased the complexity and size of simulations. Our objective is to develop a flexible flow visualization tool for fluid simulations that include the full physics and geometrical complexities found in modeling practical combustion systems, such as internal combustion engines. The challenges to flow visualization come from: (1) the large simulation output, especially when using massively parallel computers; (2) the increasingly complex geometries that include moving surfaces such as pistons and valves; (3) the complex physical phenomena in realistic problems of fuel injection, combustion fronts, boundary flows, and large scale turbulence; and (4) the numerical complexity of indirect addressing of computational elements, variable mesh connectivity, distorted elements, and moving meshes. We have developed a visualization program that addresses these complexities. The program was developed as a post-processor to the KIVA family of codes for reactive flow simulations. Because of the complexity of the KIVA codes, the visualization program is very versatile and applicable to any code with meshes of arbitrary hexahedrons. No comparable commercial visualization package could be found. To visualize the fluid flow, we use mass-less tracer particles that follow the movement of the fluid as determined from output files from

the simulation. The movement of the tracer particles is based on a second-order spatial and temporal interpolation of the fluid velocities from successive simulation output files. The visualization program runs on a Silicon Graphics IRIS GTX workstation.

10565 (NEI-NO–485) **The Sleipner experience.** Rekdal, O. (Statoil (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1993. 18p. (CONF-9311288–3: ONS '93: Offshore Northern Seas. advanced projects conference, Stavanger (Norway), 23-24 Nov 1993). Order Number DE95755168. Source: OSTI; NTIS.

The conference paper deals with the tragic fate when the Sleipner A's concrete substructure sank during the construction work in August 1991. Exactly two years to the the day after the concrete gravity base sank, the new Sleipner A platform was installed, and there was gas in the pipeline all the way from Sleipner A to the terminal in Zeebrugge. The author throws light on what made this possible and how to apply the Sleipner experience to new projects. 6 figs.

10566 (NEI-NO–492) **Upgrading and utilization of existing infrastructure.** Carlsen, H. (Statoil, Stavanger (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1993. 13p. (CONF-9311288–10: ONS '93: Offshore Northern Seas. advanced projects conference, Stavanger (Norway), 23-24 Nov 1993). Order Number DE95755175. Source: OSTI; NTIS.

The conference paper concentrates on the situation at the Norwegian Statfjord Field which has been in production since 1979 consisting of three platforms. The field is still producing above the original design of 109700 Sm^3/day, but there are tendencies of a declining production. Improvements by upgrading existing equipment are made by optimization of process conditions, installation of High-Surface-Area internals in separators, parallel operation of compression trains, successful use of process chemicals, upgrading of relief systems, and installation of hydrocyclons in water treatment system. 8 figs.

10567 (NEI-NO–493) **Offshore project management in the Gulf of Mexico from an operator's perspective.** Kern, F.B. (Exxon Co., New Orleans, LA (United States)). Norsk Petroleumsforening, Oslo (Norway). 1993. 20p. (CONF-9311288–11: ONS '93: Offshore Northern Seas. advanced projects conference, Stavanger (Norway), 23-24 Nov 1993). Order Number DE95755176. Source: OSTI; NTIS.

The conference paper deals with offshore project management in the Gulf of Mexico (GOM) which have covered a broad spectrum of water depths, technology advancement, and operational evolution. Projects completed during the last four years cover a full range of water depths, technology employed, and project complexity. Concentrating on the post-approval implementation on production system projects, the presentation will cover a description of Exxon's operations and recent projects in the GOM, internal project management organizations employed, the various contracting plans utilized and a description of the regulatory aspects of prospect development. The discussion will include recent trends in project management focus areas and will conclude with a discussion of what the activating forces have been relative to the generally perceived success/efficiency of GOM project implementation, as well as the challenges and opportunities for improvement that lie ahead for the industry in effective project management and continued development oil and gas reserves. 13 figs.

10568 (DOE/EW/50009–T2) **Minutes of the CAALS Workshop on modularity and communications standards.** Kramer, G.W. National Inst. of Standards and Technology (NEL), Gaithersburg, MD (United States). Automated Production Technology Div. [1991]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI01-90EW50009. Order Number DE95005780. Source: OSTI; NTIS; GPO Dep.

This Workshop was organized similarly to the previous meeting. After a presentation by Scott Tilden on Instrument Interfacing, three of the four Working Groups met individually. The Strategic Planning Committee did not meet at this Workshop, but it held a meeting in April; the minutes of that meeting are included. The Physical link and Transport Committee has defined the requirements for the link connecting modules to their controller, examined a new ASTM standard for low-level communication, and is determining what fits into to the various layers of the ISO model. The Module Requirements Group has proposed a process control model, has defined the core functionality, and has listed the requirements for a Standard Laboratory Module. The Software Engineering Group proposed that a document detailing the CAALS Modularity Architectural Specification be prepared and presented a working outline. The future structure and charters of the committees and the decision making criteria of the Workshop itself were questioned. These items will be examined in greater detail at the next Workshop.

10569 (ENEA-RT-ERG–93-47) **Circuit simulation of amorphous silicon thin film transistors and evaluation of their driving method.** Della Sala, D. (ENEA, Portici (Italy). Centro Ricerche Fotovoltaiche); Giammattei, D.; Grillo, P.; Marucci, L.; Pascarella, F.; Roca, F. ENE ., Portici (Italy). Centro Ricerche Fotovoltaiche. Jan 1994. 50p. (In Italian). (RT/ERG–93-47). Order Number DE95749687. Source: OSTI; NTIS (US Sales Only).

It's described the preparation of a complete procedure for the circuit simulation of amorphous silicon thin film transistors. They make up an active matrix of local switches for the addressing of the individual pixels in flat-panel liquid cristal displays. It's evaluated the best external driving method of the whole matrix to be used for displayng Tv pictures.

10570 (ENEA-RT-INN–94-02) **Analytical method for compact discharge electrodes in asymmetrical geometries.** Flora, F. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Mezi, L. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Jan 1994. 9p. 36p. Order Number DE95749721. Source: OSTI; NTIS (US Sales Only).

The development of discharge pumped gas lasers is strictly connected to the capability of constructing suitable electrodes which produce a uniform electric field in the discharge region. In particular, when the gas mixture generates instabilities, as in the case of excimer laser, a uniformity of few percent on the field is requested to guarantee a good beam quality and a long efficient discharge pumping time. Different electrodes design techniques have been developed to get a good field uniformity at the electrode surface. We remind the conformal transformations of Chang and Ernst. A different approach has been introduced by Stappaerts who, starting from the field distribution at the midplane between the two electrodes (taken as input boundary condition), proposed a solution of the Laplace equation. In this way, changing the input field profile at the midplane it is possible to optimize the field characteristics in the whole discharge region. Anyway, in all the above mentioned techniques symmetry conditions are imposed on the potential in such a way that the midplane (x-axis) is requested to be an equipotential surface and, consequently, the electric field to be symmetric with respect to the midplane. In this paper the function f(x), proposed by Stappaerts as input profile of the electric field y-component at the midplane, is analyzed and compared with other suitable functions generating interesting field geometries and electrodes structures. Furthermore, a new solution to the Laplace equation is proposed, taking as boundary conditions both the x and y components of the electric field at the midplane. In this way any symmetry requirement is remove and, hence, the design of the electrodes profiles in a more real context is now possible, including in the electrode profile computation also the effect of some elements situated close to the discharge region.

10573 (ENEA-RT-INN–94-03, pp. No pagination) **Compact three electrodes excimer laser 'IANUS' for POPA optical system.** Bollanti, S. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Di Lazzaro, P.; Giordano, G.; Flora, F.; Letardi, T.; Schina, G.; Petrucci, C.; Zheng, C. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Mar 1994. (CONF-9404135–Vol.1: 5. international symposium on high power lasers and applications, Vienna (Austria), 5-8 Apr 1994; RT/INN–94-03). In *Contributions to international symposium on high power lasers*. 36p. Order Number DE95749721. Source: OSTI; NTIS (US Sales Only).

In this paper it is presented the experimental results of 'IANUS', a test bed in scale 1:1 of the novel discharge configuration of EOLUS. The IANUS laser system differs from EOLUS only for the pfr (100 Hz instead of 1 kHz). The patented peculiarity of IANUS (and hence of EOLUS) is the discharge pumping configuration, as the two pumped active media (dimensions 1,5 x 2 x 100 cm^3 and 2 x 3 x 100 cm^3) are located nearby in such a way that the recirculating gas flows sequentially through the two gaps. Moreover, the two electrode couples are connected in series so that there is a common electrode floating with respect to the ground. In this way, the use of a low energy high voltage spiker is made easier, and its connection to the floating electrode allows the fast increment of the electron number density and the good matching between the active medium and the external pumping circuit impedances. Consequently, a higher overall efficiency can be obtained. The two active media in series are pumped at the same time by the same current and then a combined Power Oscillator Power Amplifier (POPA) optical system can be operated. Using XeCl as active medium (=308 nm) and with two independent flat-flat optical cavities, the output laser energies of 0,5 + 1,1 J have been extracted with FWHM pulse durations of 147 ns and 185 ns, respectively. The maximum overall efficiency achieved is in excess of 3% with a total output energy of 1,3 J/pulse. When operating IANUS at pfr of 100 Hz, an average power of 60 W (in bursts) has been obtained. The complete characterization of the optical and electrical parameters of IANUS will be presented together with the preliminary results of a POPA system designed to achieve a high power, single transverse mode laser beam.

10574 (ENEA-RT-INN–94-19) **Self-injected XeCl excimer laser.** Di Lazzaro, P. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Flora, F.; Letardi, T. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Oct 1994. 27p. (RT/INN–94-19). Order Number DE95749723. Source: OSTI; NTIS (US Sales Only).

It is presented the experimental and modelling results of the first self-injected excimer laser. The intracavity losses of a XeCl oscillator are properly modulated by a Pockels Cell allowing the generation, amplification and extraction of short laser pulses with selectable duration in the range (1-12)ns, tailored temporal profile and peak power increment up to a factor three. Longer output laser pulses, up to 100 ns, can be obtained by slicing the intracavity laser radiation without peak power increment. Laser output peak power in excess of 2 MW have been obtained, with remarkable reproducibility characteristics.

10575 (ENEA-RT-INN–94-22) **Color center laser at 1.5 μm with a new configuration.** Baldacchini, G. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Montereali, R.M.; Nava, E.; Cremona, M. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Nov 1994. 23p. (RT/INN–94-22). Order Number DE95749669. Source: OSTI; NTIS (US Sales Only).

Color center lasers which operate in the near IR have been developed until now around the central idea of three mirror folded cavity arranged in an horizontal plane. The active crystal is then mounted in a vertical cryostat, containing also few optical elements of the cavity, which complicates the functioning of the laser and decreases its flexibility. A new type of laser where the three mirror folded cavity is vertical and the cold finger of the cryostat is inserted from a side, and, most important, there is not any entanglement between cryostat and optical cavity, has been realized. This deposition allows to change easily the optical frame, the crystal, and eventually to use other kind of active crystals at RT.

10576 (ENEA-RT-INN–94-23) **Split-operator technique and solution of Liouville propagation equations.** Dattoli, G. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Giannessi, L.; Torre, A.; Ottaviani, P.L. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Jul 1994. 19p. (RT/INN–94-23). Order Number DE95749664. Source: OSTI; NTIS (US Sales Only).

The split-operator technique (SOT) is used to solve evolution equations of the Liouville type. The method proposed is based on an iterative application of the evolution operator, associated with the equation under study, on the initial distribution. The SOT approximation of the evolution operator leads to analytical expressions that can be easily programmed. The validity of the method, solving the Liouville equation governing the longitudinal phase-space dynamics of an e-beam undergoing FEL interaction and the phase-space evolution of a quartic anharmonic oscillator is discussed.

10577 (ENEA-RT-INN–94-32) **Colored layers of LiF for integrated optical devices.** Baldacchini, G. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Montereali, R.M.; Masetti, E.; Martelli, S.; Montecchi, M.; Righini, C.; Pelli, S.; Scavarda do Carmo, L.C.; Cremona, M. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Sep 1994. 11p. (CONF-9407167–1: Topical symposium on advanced materials in optics, electro-optics, and communication technologies, Florence (Italy), 1-4 Jul 1994; RT/INN–94-32). Order Number DE95749731. Source: OSTI; NTIS (US Sales Only).

The realization of chips where the passive and active functions could be performed using the guided propagation of ligth is the main objective of integrated optics. The search for new materials and technology for a more efficient integration prompted us to investigate the optical properties of thin layers of LiF, where optically active electronic defects (color centers) can be created by low energy electron beams. Their limited penetration allows the preparation of thin layers with high concentration of defects located at the surface of the crystalline material, bulk and film. Emission of color centers in the visible range has been measured together with a sizeable optical gain coefficient. Absorption and ellipsometric measurements show an increase of about 5 per cent of the real part of the refractive index in the same wavelength region. These results are promising for ligth generation and waveguiding in this new kind of material.

10578 (ENEA-RT-INN–94-40) **Full-wave analysis of indefinite microstrip lines and microstrip discontinuities.** D'Atanasio, P. (ENEA, Casaccia (Italy). Area Energia e Innovazione); Lazzi, G.; Rubino, E.; Bernardi, P.; Cicchetti, R. ENEA, Casaccia (Italy). Area Energia e Innovazione. Oct 1994. 47p. (In Italian). (RT/INN–94-40). Order Number DE95749725. Source: OSTI; NTIS (US Sales Only).

In this work, a method for the analysis of indefinite microstrip lines and microstrip discontinuities of arbitrary shape is presented; a theoretical background for 'full-wave' spectral-domain analysis is furnished. The electric field integral equation, formulated in terms of spectral dyadic Green's function and solved with Method of Moments, allows to characterize the structures considered. Practical aspects, like choice of expansion functions and numerical methods, are carefully discussed. Comparison with experimental data and results of several papers shows excellent agreement.

10579 (ENEA-RT-INN–94-49) **Free electron laser dynamics, evolution of bunching coefficients and coherent harmonic generation.** Dattoli, G. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Giannessi, L.; Ottaviani, P.L.; Segreto, A. ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione. Jun 1994. 29p. (RT/INN–94-49). Order Number DE95749710. Source: OSTI; NTIS (US Sales Only).

The Free Electron Laser (FEL) dynamics is characterized by the interplay between banching and emission processes. The first mechanism can be quantitatively specified in terms of the so called bunching coefficients, which determine the degree of the bunching at fundamental and so higher harmonics. Numerically the Lionville equation is solved, ruling the longitudinal FEL phase-space dynamics, and evaluate the bunching coefficients. The dependence of these coefficients on various parameters is analized, like the e-beam energy spread, the laser intensity ect. The simple scaling formulae and the usefulness of the results for the design of FEL exploiting prebunched e-beams are presented and discussed.

10580 (Juel–2905) **Examination of superconductor-semiconductor hybrid devices in the niob/silicon system.** Becker, T. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Schicht- und Ionentechnik; Giessen Univ. (Germany). May 1994. 139p. (In German). Order Number DE95756260. Source: OSTI; NTIS (US Sales Only).

Examinations are reported superconductor-semiconductor hybrid devices in the niob/silicon system. The experimental examinations cover layer systems within one construction element, as well as the possibility of the integration of discrete, superconducting and semiconducting construction elements on a substrate. The use of a superconductor as metallization of a Schottky diode leads during operation below the transition temperature to a significant non-linearity of the characteristics of such a super-Schottky diode, because of an energy gap of the superconductor. The non-linearity of the characteristics of such diodes makes them appropriate construction elements for mixers and detectors. As a basis for superconducting field effect transistors (SuFETs)-, superconductor-semiconductor-superconductor proximity effect contacts were produced. A series of such contacts showed supercurrent, and by means of high frequency radiation, the AC-Josephson effect could be proved. With the superconductor-semiconductor-superconductor proximity effect contacts, exclusively DC- and HF SQUIDs were produced, and investigated concerning their noise behaviour. Further the possibility of an integration of an HF SQUID with a cooled preamplifier was investigated, as the noise of the overall system can be reduced in this way. (MM)

10581 (Juel–2949) **Charge transport and recombination investigations in hydrogenated amorphous silicon (a:Si:H) pin diodes by its forward current mode.** Becker, F. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Schicht- und Ionentechnik; Duesseldorf Univ. (Germany). Jul 1994. 103p. (In German). Order Number DE95756100. Source: OSTI; NTIS (US Sales Only).

The transport and recombination in hydrogenated amorphous silicon (a-Si:H) pin-diodes is investigated by its forward current densities, electroluminescence and optical properties. The diodes mainly consist of p-doped (p), intrinsic (i) and n-doped (n) amorphous silicon layers. The EL-quantum efficiency is constant at increasing forward bias, i.e. the current is a pure recombination current. Time resolved measurements reveal the following: After applying a rectangular voltage pulse a space charge limited current is followed by a double injection recombination current with a delay time. The dependence of the delay time on various parameters, e.g. the puls repetition rate, the temperature and the voltage between the pulses is discussed in this work. Simultaneously transients of the electroluminescence were measured, which show the beginning of the recombination with a certain delay time. These delay times are a measure of the average radiative lifetime (about 1 μs at room temperature). The nonradiative lifetime can be calculated being less than 1 ns by taking the low quantum efficiency. (orig./MM)

10582 (LA–12860-MS) **AFC generator development.** Freeman, B.L.; Fowler, C.M.; Sheppard, M.G.; Sowder, K.D. Los Alamos National Lab., NM (United States). Feb 1995. 17p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95007094. Source: OSTI; NTIS; GPO Dep.

By adapting the disk generator tested by Fowler, Hoeberling, and Marsh, the advanced flux compression (AFC) generator is able to produce a maximum dI/dt that is greater than 3 MA/μs. This current rise characteristic results in an inductive voltage across a 0.5-nH load of $\geq$ 1.5 kV. This has been achieved with high gain, low loss, and a compact size. The AFC generator has been tested in four shots, and is performing beyond initial goals.

10583 (LA-UR–94-378) **Time-dependent numerical simulation of vertical cavity lasers.** Thode, L.E. (Los Alamos National Lab., NM (United States)); Csanak, G.; So, L.L.; Kwan, T.J.T.; Campbell, M. Los Alamos National Lab., NM (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-940142–48: OE/LASE '94: conference on optics, electro-optics, and laser applications in science and engineering, Los Angeles, CA (United States), 22-29 Jan 1994). Order Number DE95006862. Source: OSTI; NTIS; GPO Dep.

To simulate vertical cavity surface emitting lasers (VCSELs), the authors are developing a three-dimensional, time-dependent field-gain model with absorption in bulk dielectric regions and gain in quantum well regions. Since the laser linewidth is narrow, the bulk absorption coefficient is assumed to be independent of frequency with a value determined by the material and the lattice temperature. In contrast, the frequency-dependent gain regions must be solved consistently in the time domain. Treatment of frequency-dependent media in a finite-difference time-domain code is computationally intensive. However, because the volume of the quantum well regions is small relative to the volume of the multilayer dielectric (MLD) mirror regions, the computational overhead is reasonable. A key issue is the calculation of the fields in the MLD mirror regions. Although computationally intensive, good agreement has been obtained between simulation results and matrix equation solutions for the reflection coefficient, transmission coefficient, and bandwidth of MLD mirrors. The authors discuss the development and testing of the two-dimensional field-gain model. This field-gain model will be integrated with a carrier transport model to form the self-consistent laser code, VCSEL.

10584 (LA-UR–94-3823) **Improved performance 1590 nm Er:YLF laser.** Marchbanks, R.D.; Petrin, R.R.; Cockroft, N.J. Los Alamos National Lab., NM (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950540–1: 15. conference on lasers and electro-optics and 5th quantum electronics and laser science conference, Baltimore, MD (United States), 21-26 May 1995). Order Number DE95003691. Source: OSTI; NTIS; GPO Dep.

We present an improvement in the performance of a 1590 nm ER:YLF laser through simultaneous laser operation at 2717 nm. A slope efficiency of 7.0% with an output of 13.2 mW has been achieved with 971 nm pumping.

10585 (LA-UR–95-41) **Trident as an ultrahigh irradiance laser.** Johnson, R.P.; Moncur, N.K.; Cobble, J.A.; Watt, R.G.; Gibson, R.B. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950226–8: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science,

engineering and medicine, San Jose, CA (United States), 5-10 Feb 1995). Order Number DE95006345. Source: OSTI; NTIS; GPO Dep.

The Trident Nd:glass ICF laser at Los Alamos may be operated in a mode that produces high ultrashort pulses by the chirp/compression method. The 125-ps pulses from a standard moderated, ND:YLF oscillator are first frequency-broadened to 3-nm bandwidth, chirped in a quartz fiber, and then compressed with a grating pair to 1.5 ps. A second quartz fiber then provides nonlinear polarization rotation for background and satellite suppression and to further broaden the spectrum to >7 nm. Pulses are chirped again to 1 ns width with a second grating pair and amplified in a ND:YAG pumped Ti:sapphire regenerative amplifier. Millijoule-level output is then amplified through the existing phosphate glass Trident amplifier chain before compression to <400 fs. Energy ≥1 J with excellent beam quality and contrast ratio is routinely produced by compressing after three rod amplifier stages. Higher energies are possible by compression further along the amplifier chain. Simultaneous use of long (~1 ns) pulses for plasma formation is also possible.

10586 (LBL–36582) **Finite pulse effects in self-amplified-spontaneous emission.** Kim, Kwang-Je; Hahn, Sang June. Lawrence Berkeley Lab., CA (United States). Sep 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9408146–15: 16. international free electron laser conference, Stanford, CA (United States), 21-26 Aug 1994). Order Number DE95006585. Source: OSTI; NTIS; INIS; GPO Dep.

The authors study the effects of the electron density profile on self-amplified-spontaneous-emission (SASE). A general formalism in the linear regime is developed by deriving the coupled Maxwell-Klimontovich equations for an arbitrary density profile and including the effects of the energy spread, diffraction, and the betatron oscillation. An explicit solution is obtained for the one-dimensional (1-D) case. The temporal and the spectral intensity profiles of SASE depend linearly on the initial electron correlation function. The correlation function consists of two terms, a term giving rise to the usual spontaneous radiation and its amplification to SASE, and a term representing the coherent bunched beam effect. The latter term has been neglected so far in the treatments of SASE, but it could be significant when there is a variation in the electron density at a length scale comparable to the wavelength. The theory reproduces the well-known results when the electron density is uniform. It also reproduces a recent theory for a finite top-hat density profile and a vanishing energy spread.

10587 Parasitic oscillation suppression in solid state lasers. Zapata, L.E. To Dept. of Energy. 1992. Filed date 29 Oct 1992. U.S. Patent Application 7-968,111. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95006130. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A thin absorbing film is bonded onto at least certain surfaces of a solid state laser gain medium. An absorbing metal-dielectric multilayer film is optimized for a broad range of incidence angles, and is resistant to the corrosive/erosive effects of a coolant such as water, used in the forced convection cooling of the film. Parasitic oscillations hamper the operation of solid state lasers by causing the decay of stored energy to amplified rays trapped within the gain medium by total and partial internal reflections off the gain medium facets. Zigzag lasers intended for high average power operation require the ASE absorber.

10588 Pulse compression and prepulse suppression apparatur. Dane, C.B.; Hackel, L.A.; George, E.V.; Miller, J.L.; Krupke, W.F. 1992. Filed date 29 Oct 1992. U.S. Patent Application 7-968,570. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95006127. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of a pulse compression and prepulse suppression apparatus for time compressing the output of a laser. A pump pulse is separated from a seed pulse by a first polarized beam splitter according to the orientation of a half wave plate. The seed pulse is directed into an SBS oscillator by two plane mirrors and a corner mirror, the corner mirror being movable to adjust timing. The pump pulse is directed into an SBS amplifier wherein SBS occurs. The seed pulse, having been propagated from the SBS oscillator, is then directed through the SBS amplifier wherein it sweeps the energy of the pump pulse out of the SBS amplifier and is simultaneously compressed, and the time compressed pump pulse is emitted as a pulse output. A second polarized beam splitter directs any undepleted pump pulse 58 away from the SBS oscillator.

10589 Shielded serpentine traveling wave tube deflection structure. Hudson, C.L.; Spector, J. 1992. Filed date 29 Oct 1992. U.S. Patent Application 7-968,630. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-88NV10617. Order Number DE95006126. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of a shielded serpentine slow wave deflection structure having a serpentine signal conductor within a channel groove. The channel groove is formed by a serpentine channel in a trough plate and a ground plane. The serpentine signal conductor is supported at its ends by coaxial feed through connectors. A beam interaction trough intersects the channel groove to form a plurality of beam interaction regions wherein an electron beam may be deflected relative to the serpentine signal conductor.

10590 (SAND–94-2423) **Time-optimal control of the magnetically levitated photolithography platen.** Redmond, J.; Tucker, S. Sandia National Labs., Albuquerque, NM (United States). Jan 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95005493. Source: OSTI; NTIS; GPO Dep.

This report summarizes two approaches to time-optimal control of a nonlinear magnetically levitated platen. The system of interest is a candidate technology for next-generation photolithography machines used in the manufacture of integrated circuits. The dynamics and the variable peak control force of the electro-magnetic actuators preclude the direct application of classical time-optimal control methodologies for determining optimal rest-to-rest maneuver strategies. Therefore, this study explores alternate approaches using a previously developed computer simulation. In the first approach, conservative estimates of the available control forces are used to generate suboptimal switching curves. In the second approach, exact solutions are determined iteratively and used as a training set for an artificial neural network. The trained network provides optimal actuator switching times that incorporate the full nonlinearities of the magnetic levitation actuators. Sample problems illustrate the effectiveness of these techniques as compared to traditional proportional-derivative control.

10591 (SAND–94-2426C) **Atomic force microscopy as a process characterization tool for GaAs-based integrated circuit fabrication.** Howard, A.J.; Baca, A.G.; Shul, R.J.; Zolper, J.C.; Sherwin, M.E.; Rieger, D.J. Sandia National Labs., Albuquerque, NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950117–2: Workshop on semiconductor characterization, Gaithersburg, MD (United States), 30 Jan - 2 feb 1995). Order Number DE95006223. Source: OSTI; NTIS; GPO Dep.

While developing the fabrication process for GaAs-based integrated circuits numerous situations have been encountered where an in-line and post-process characterization tool which operates in a non-destructive manner was required. We will report several examples which demonstrate that the atomic force microscope (AFM) fills this characterization void in our laboratory. The AFM is extremely useful where the unintentional removal of small amounts of GaAs can be detrimental in the fabrication of devices with very thin active layers, e.g., FET channels within 30 nm of the GaAs surface. We have also characterized the use of AFM as a non-destructive tool to determine complete etching of 1.25 μm Si_3N_4 via holes for a two-level interconnect process. The AFM has been useful in optimizing the ion implant activation anneal conditions of $Al_{0.75}Ga_{0.25}Sb$ epitaxial layers by comparing the morphology through RMS roughness measurements. Finally we have observed differences in wet etch results based on prior process history, such as 1-5 nm differences in etch depth and morphological differences

of ion implanted vs. non-implanted areas. The results and implications from these various AFM processing studies will be presented in this paper.

10592 (SAND–94-2577C) **The impact of multiplexing on the dynamic requirements of analog-to-digital converters.** Sobering, T.J.; Kay, R.R. Sandia National Labs., Albuquerque, NM (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950436–1: IEEE instrumentation/measurement technology conference: annual conference and technical meeting of the IEEE Instrumentation and Measurement Society: I3C - integrating intelligent instrumentation and control, Waltham, MA (United States), 2 Order Number DE95006302. Source: OSTI; NTIS; GPO Dep.

In data acquisition applications where the signals being digitized are produced in a time-division multiplexed system, the required dynamic performance of the analog-to-digital converter (ADC) is no longer bound by the conditions set forth in the Sampling Theorem. This results from the introduction of very high frequency information by the multiplexing process which, while not necessarily containing information of interest, must be processed by the input circuitry of the ADC. In this situation, signal bandwidths and slew rates can greatly exceed those produced in a Nyquist limited system and can surpass the capability of the ADC, thus degrading overall system performance. This paper will examine two common multiplexing schemes and their impact on ADC dynamic requirements. First, we will examine a simple voltage multiplexing scheme typically found in state-ofhealth or data-logging applications and develop the necessary equations to show how the ADC dynamic requirements are affected. Then, the analysis will then be extended to a multiplexed photodiode array readout to see how this application further challenges the dynamic performance of the ADC. Finally, the issues associated with developing dynamic test methodologies for assessing ADC performance in multiplexed systems will be discussed.

10593 (SAND–94-3109C) **Flat panel display development activities at Sandia National Laboratories.** DiBello, E.G.; Worobey, W.; Burchett, S.; Hareland, W.; Felter, T.; Mays, B. Sandia National Labs., Albuquerque, NM (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505157–1: SID '95: Society for Information Display, Orlando, FL (United States), 21-26 May 1995). Order Number DE95005442. Source: OSTI; NTIS; GPO Dep.

The flat panel display development activities underway at Sandia National Laboratories are described. Research is being conducted in the areas of glass substrates, phosphors, large area processes, and electron emissions. Projects are focused on improving process yield, developing large area processes, and using modeling techniques to predict design performance.

10594 (SAND–94-3257C) **I_{DDQ} Testing and Defect Classes: A Tutorial.** Soden, J.M. (Sandia National Labs., Albuquerque, NM (United States)); Hawkins, C.F. Sandia National Labs., Albuquerque, NM (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505154–1: Custom integrated circuits conference, Santa Clara, CA (United States), 1-4 May 1995). Order Number DE95005467. Source: OSTI; NTIS; GPO Dep.

I_{DDQ} testing of CMOSICs is a technique for production quality and reliability improvement, design validation, and failure analysis. The origin and basic concepts of I_{DDQ} testing are reviewed. The relationship of I_{DDQ} testing to other test methods is considered in the context of the whole IC life cycle from design, fabrication, and test through end use. A comprehensive test strategy is described that uses defect classes based on defect electrical properties rather than traditional fault models.

10595 (SAND–95-0315C) **Evaluation and qualification of environmentally conscious manufacturing processes for commercial and military applications.** Anderson, D.J.; Cranwell, R.M.; Iman, R.; Van Buren, P.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950591–1: IEEE international symposium on electronics and the environment, Orlando, FL (United States), 1-3 May 1995). Order Number DE95008520. Source: OSTI; NTIS; GPO Dep.

Environmental regulations are encouraging the development of new environmentally conscious manufacturing (ECNP processes. However, the quality and reliability of these processes and hardware produced must be understood prior to implementing these new technologies in factories. Furthermore, military hardware fabrication is governed by standards and specifications that frequently mandate the use of older, less environmentally friendly processes or materials, or prohibit the use of new ECM processes without advance military approvaL Sandia National Laboratories, with industrial and military partners, have developed methodologies for evaluating and qualifying new ECM processes for military and commercial applications, and have piloted these methodologies in qualifying new, low-residue soldering technologies and materials.

10596 (SAND–95-8459C) **Temporal characterization of the Stanford Mid-IR FEL by frequency-resolved optical gating.** Richman, B.A. (Stanford Univ., CA (United States). W.W. Hansen Labs. of Physics); DeLong, K.W.; Trebino, R. Sandia National Labs., Livermore, CA (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950540–6: 15. conference on lasers and electro-optics and 5th quantum electronics and laser science conference, Baltimore, MD (United States), 21-26 May 1995). Order Number DE95006496. Source: OSTI; NTIS; GPO Dep.

We measure the time-dependent intensity and phase of laser pulses from the Stanford Mid-IR FEL. We present the first measurements of near-transform-limited, linearly chirped, and sideband modulated FEL pulses.

10597 (SAND–95-8465C) **Low power limits in ultrashort pulse measurement using Frequency-Resolved Optical Gating.** Fittinghoff, D.N.; DeLong, K.W.; Jennings, R.; Ladera, C.L.; Trebino, R. Sandia National Labs., Livermore, CA (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950540–4: 15. conference on lasers and electro-optics and 5th quantum electronics and laser science conference, Baltimore, MD (United States), 21-26 May 1995). Order Number DE95007150. Source: OSTI; NTIS; GPO Dep.

We quantify the low power limits in SHG and PG FROG, in both single- and multi-shot configurations, for pulses as weak as 30 pecadilloes. We anticipate that femtojoule operation may be possible.

10598 (SAND–95-8467C) **Effect of noise on Frequency-Resolved Optical Gating measurements of ultrashort pulses.** Fittinghoff, D.N.; DeLong, K.W.; Ladera, C.L.; Trebino, R. Sandia National Labs., Livermore, CA (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950540–3: 15. conference on lasers and electro-optics and 5th quantum electronics and laser science conference, Baltimore, MD (United States), 21-26 May 1995). Order Number DE95007149. Source: OSTI; NTIS; GPO Dep.

We study the effects of noise in Frequency-Resolved Optical Gating measurements of ultrashort pulses. We quantify the measurement accuracy in the presence of additive, muliplicative, and quantization noise, and discuss filtering and pre-processing of the data.

10599 (SAND–95-8485C) **Ultrashort Pulse retrieval using FROG trace irradiance moments and the adaptive neural networks backpropagation algorithm.** Ladera, C.L.; DeLong, K.W.; Trebino, R.; Fittinghoff, D.N. Sandia National Labs., Albuquerque, NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950540–5: 15. conference on lasers and electro-optics and 5th quantum electronics and laser science conference, Baltimore, MD (United States), 21-26 May 1995). Order Number DE95007153. Source: OSTI; NTIS; GPO Dep.

We use the irradiance moments of traces obtained in Frequency Resolved Optical Gating and the Feed-forward Backpropagation Algorithm of Adaptive Neural Networks for recovering the phase and the intensity of ultrashort laser pulses.

10600 (UCRL-LR–105821-94-2, pp. 39-48) **Production of multi-terawatt laser pulses in Cr:LiSrAlF$_6$.** Ditmire, T.; Perry, M.D. Lawrence Livermore National Lab., CA (United States).

[1994]. In *Inertial confinement fusion. Quarterly report, Volume 4, Number 2, January–March 1994.* 49p. Order Number DE95000314. Source: OSTI; NTIS.

In the last few years significant effort has gone into the design and development of small-scale, high-power picosecond and femtosecond laser systems. Recent advances in laser technology have made possible the development of "tabletop"-scale lasers with peak laser powers of over 1 TW. This short-pulse laser development has been motivated by challenges that have arisen in multiphoton and strong-field physics. Terawatt-class, sub-picosecond laser systems are required for the study of very-high-order multiphoton processes such as ionization to high charge states, the generation of high-order harmonics, the study of high-density laser plasmas, and the creation of an optically ionized, recombination pumped x-ray laser. Such short-pulse systems require amplifier materials with a broad gain bandwidth to support the amplification of the broad spectra associated with sub-picosecond pulses. Most of these systems use broad-bandwidth solid state laser materials, which are particularly attractive for tabletop lasers because of their good energy storage characteristics and their ease of use. Developments in solid state laser material science in the last 10 years have made possible the development of systems with pulse durations as short as 100 fs.

Accelerator-driven subcritical blankets reattract attention recently due to acknowledgment of increased importance of their main safety advantage - impossibility of run-away accidents. But there still are safety, economy, neutronics and technology problems to be solved and questions to be answered before going to large scale projects. Most serious of those problems are reviewed and estimated in this paper. (author). 9 refs, 3 tabs.

A particle accelerator-driven spallation target and corresponding blanket region are proposed for the ultimate disposition of weapons-grade plutonium being retired from excess nuclear weapons in the US and Russia. The highly fissile plutonium is contained within .25 to .5 cm diameter silicon-carbide coated graphite beads, which are cooled by helium, within the slightly subcritical blanket region. Major advantages include very high one-pass burnup (over 90 %), a high integrity waste form (the coated beads), and operation in a subcritical mode, thereby minimizing the vulnerability to the positive reactivity feedbacks often associated with plutonium fuel.

It has become increasingly clear to a wide cross section of the synchrotron radiation research community that FELs will be the cornerstone of Fourth Generation Radiation Sources. Through the coherent generation of radiation, they provide as much as 12 orders of magnitude increase in peak power over the third generation storage ring machines of today. Facilities have been proposed which will extend the operating wavelength of these devices well beyond the reach of existing solid state laser technology. In addition, it appears possible to generate pulses of unprecedented brevity, down to a few femtoseconds, with mJ pulse energies. The combination of these attributes has stimulated considerable interest in short wavelength FELs for experiments in chemical, surface, and solid state physics, biology and materials science. This paper provides a brief overview of how the features of these FEL's relate to the experimental opportunities.

(CONF-9407157–3: International conference on the history of original ideas and basic discoveries in particle physics, Erice (Italy), 29 Jul - 4 aug 1994). Order Number DE95005106. Source: OSTI; NTIS; INIS; GPO Dep.

The subject of this presentation was intended to cover the history of hadron colliders. However this broad topic is probably better left to historians. I will cover a much smaller portion of this subject and specialize my subject to the history of the Tevatron. As we will see, the Tevatron project is tightly entwined with the progress in collider technology. It occupies a unique place among accelerators in that it was the first to make use of superconducting magnets

and indeed the basic design now forms a template for all machines using this technology. It was spawned in an incredibly productive era when new ideas were being generated almost monthly and it has matured into our highest energy collider complete with two large detectors that provide the major facility in the US for probing high Pt physics for the coming decade.

Main parameters of a cyclotron facility for generation of 1 GeV 100 mA proton beam in dc mode are given. It includes 180 keV 10 mA injector, 28 MeV isochronous separated sector cyclotron, SC 240 MeV booster separated orbit cyclotron and 1 GeV main one. Orbit separation in the sector cyclotron is achieved by application of 6 dees with 75 kV on each. Beam bending and focusing in the SOCs is fulfilled by a system of miniature dipoles and quadrupoles of the same type that form 10 spiral channels. The channels are placed one on another in common LHe (liquid helium) cryostat. The beams injected in the channels by the 10 sector cyclotrons are accelerated by 12 warm 500 kV rf cavity in the booster cyclotron and by 44 ones in the main SOC. Division of the required intensity beam at the start of acceleration into 10 separated channels provides stable operation of the facility and its control flexibility. Standardization of hf generators, cavities, SC magnets and other elements of the facility permits one to organize mass production of the elements and to decrease their costs. (author). 11 refs., 5 figs., 7 tabs.

10613 (LA-UR–95-34) **Application of conventional laser technology to gamma-gamma colliders.** Clayton, C.E. (Univ. of California, Los Angeles, CA (United States)); Kurnit, N.A.; Meyerhofer, D.D. Los Alamos National Lab., NM (United States). [1995]. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-940351–5: Workshop on gamma-gamma colliders, Berkeley, CA (United States), 28-31 Mar 1994). Order Number DE95006341. Source: OSTI; NTIS; INIS; GPO Dep.

A future e^-e^+ (electron-positron) linear collider can be configured with perhaps minimal modification to serve as an γ–γ (gamma-gamma) or a e^-–γ collider. This is accomplished by Compton-backscattering low energy photons (from a laser source) off of the high-energy electron beams prior to the crossing of the electron beams. However, to be competitive with the e^-e^+ configuration, the luminosity cannot be compromised in the process. This requires that the laser source deliver a sufficient number of photons per pulse with a pulse format and rate matching that of the electron beams. As it turns out, this requires an average optical power of 5 to 15 kW from the laser which is beyond the current state of the art. In this paper, the authors address how to generate the required pulse format and how the high average power requirement can be met with conventional laser technology. They also address concerns about the survivability of mirrors located near the interaction point. Finally, they list a program of research and development which addresses some of the unknowns in such a system.

10614 (BNL–60351) **Field flattening in superconducting beam transport magnets.** Morgan, G.H. Brookhaven National Lab., Upton, NY (United States). [1994]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-941013–22: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95005686. Source: OSTI; NTIS; INIS; GPO Dep.

Dipoles in which the beam traverses the midplane well away from tie magnet axis may benefit from flattening of the vertical field on the midplane. A procedure is described for doing so, making use of Chebyshev polynomials. In the case of the large aperture "DX" magnets located immediately on each side of the six intersection regions of the Relativistic Heavy Ion Powder (RHIC), a comparison is made of the field of coils optimized in this way and of coils optimized in the more common way by minimizing the leading coefficients of the Fourier expansion about the magnet axis. The comparison is of the integrated Fourier coefficients of the field expanded locally along the beam trajectory.

10615 (BNL–61246) **Coupling correction using closed orbit measurements.** Safranek, J.; Krinsky, S. Brookhaven National Lab., Upton, NY (United States). 18 Feb 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-931254–9: Orbit correction and analysis in circular accelerators workshop, Upton, NY (United States), 1-3 Dec 1993). Order Number DE95005957. Source: OSTI; NTIS; INIS; GPO Dep.

The authors describe a coupling correction scheme they have developed and used to successfully reduce the vertical emittance of the NSLS X-Ray ring by a factor of 6 to below 2 A. This gives a vertical to horizontal emittance ratio of less than 0.2%. They find the strengths of 17 skew quadrupoles to simultaneously minimize the vertical dispersion and the coupling. As a measure of coupling they utilize the shift in vertical closed orbit resulting from a change in strength of a horizontal steering magnet. Experimental measurements confirm the reduced emittance.

10616 (BNL–61251) **Closed orbit related problems: Correction, feedback, and analysis.** Bozoki, E.S. Brookhaven National Lab., Upton, NY (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-931254–8: Orbit correction and analysis in circular accelerators workshop, Upton, NY (United States), 1-3 Dec 1993). Order Number DE95005969. Source: OSTI; NTIS; INIS; GPO Dep.

Orbit correction - moving the orbit to a desired orbit, orbit stability - keeping the orbit on the desired orbit using feedback to filter out unwanted noise, and orbit analysis - to learn more about the model of the machine, are strongly interrelated. They are the three facets of the same problem. The better one knows the model of the machine, the better the predictions that can be made on the behavior of the machine (inverse modeling) and the more accurately one can control the machine. On the other hand, one of the tools to learn more about the machine (modeling) is to study and analyze the orbit response to "kicks."

10617 (BNL–61252) **Eigenvector method for optimized orbit correction.** Friedman, A.; Bozoki, E. Brookhaven National Lab., Upton, NY (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-931254–11: Orbit correction and analysis in circular accelerators workshop, Upton, NY (United States), 1-3 Dec 1993). Order Number DE95005967. Source: OSTI; NTIS; INIS; GPO Dep.

The task of the orbit correction is to find the kick vector Θ for a given measured orbit vector $\vec{X}$. The authors are presenting a method, in which the kick vector is expressed as a linear combination of the eigenvectors. An additional advantage of this method is that it yields the smallest possible kick vector to correct the orbit. They will illustrate the application of the method to the NSLS X-ray and UV storage rings and the resulting measurements. It will be evident, that the accuracy of this method allows the combination of the global orbit correction and local optimization of the orbit for beam lines and insertion devices. The eigenvector decomposition can also be used for optimizing kick vectors, taking advantage of the fact that eigenvectors with corresponding small eigenvalues generate negligible orbit changes. Thus, one can reduce a kick vector calculated by any other correction method and still stay within the tolerance for orbit correction. The response matrix A is defined by the equation $\vec{X} = A\vec{\Theta}$, where $\vec{\Theta}$ is the kick vector and is the resulting orbit vector. Since A is not necessarily a symmetric or even a square matrix the authors symmetrize it by using A^TA. Then they find the eigenvalues and eigenvectors of this A^TA matrix. The physical interpretation of the eigenvectors for circular machines is discussed.

10618 (BNL–61253) **Neural network technique for orbit correction in accelerators/storage rings.** Bozoki, E.; Friedman, A. Brookhaven National Lab., Upton, NY (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-931254–10: Orbit correction and analysis in circular accelerators workshop, Upton, NY (United States), 1-3 Dec 1993). Order Number DE95005955. Source: OSTI; NTIS; INIS; GPO Dep.

The authors are exploring the use of Neural Networks, using the SNNS simulator, for orbit control in accelerators (primarily circular accelerators) and storage rings. The orbit of the beam in those machines are measured by orbit monitors (input nodes) and controlled by orbit corrector magnets (output nodes). The physical behavior of an accelerator is changing slowly in time. Thus, an adoptive algorithm is necessary. The goal is to have a trained net which will predict the exact corrector strengths which will minimize a measured orbit. The relationship between "kick" from the correctors and "response" from the monitors is in general non-linear and may slowly change during long-term operation of the machine. In the study, several network architectures are examined as well as various training methods for each architecture.

10619 (BNL–61317) **Acceleration theorems.** Palmer, R. Brookhaven National Lab., Upton, NY (United States); Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jun 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016 ; AC03-76SF00515. (CONF-940681–8: Advanced accelerator concepts workshop, Lake Geneva, WI (United States), 13-18 Jun 1994). Order Number DE95007300. Source: OSTI; NTIS; INIS; GPO Dep.

Electromagnetic fields can be separated into near and far components. Near fields are extensions of static fields. They do not radiate, and they fall off more rapidly from a source than far fields. Near fields can accelerate particles, but the ratio of acceleration to source fields at a distance R, is always less than R/λ or 1, whichever is smaller. Far fields can be represented as sums of plane parallel, transversely polarized waves that travel at the velocity of light. A single such wave in a vacuum cannot give continuous acceleration, and it is shown that no sums of such waves can give net first order acceleration. This theorem is proven in three different ways; each method showing a different aspect of the situation.

10620 (ENEA-RT-INN–94-37) **Inhomogeneous broadening parameters in Thomson-backscattering-based sources.** Dattoli, G. (ENEA, Rome (Italy). Area Nucleare); Torre, A. ENEA, Rome (Italy). Area Nucleare. Aug 1994. 17p. (RT/INN–94-37). Order Number DE95749698. Source: OSTI; NTIS (US Sales Only).

The effect of electron and laser beam quality on Thomson backscattering of an intense laser beam, recently proposed as a means of obtaining a compact, tunable high-brigtness x-ray source, is analyzed. In full analogy with magnetic undulator-based sources, appropriate parameters are introduced to account for the energy spread and emittances in the "betatron"-like electron transverse motion. The general analysis is then specialized to a Gaussian-shaped laser beam.

10621 (FNAL/C–95/005) **Orbit analysis.** Michelotti, L. Fermi National Accelerator Lab., Batavia, IL (United States). Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9409258–3: Workshop on nonlinear dynamics in particle accelerators: theory and experiments, Arcidosso (Italy), 4-9 Sep 1994). Order Number DE95007216. Source: OSTI; NTIS; INIS; GPO Dep.

The past fifteen years have witnessed a remarkable development of methods for analyzing single particle orbit dynamics in accelerators. Unlike their more classic counterparts, which act upon differential equations, these methods proceed by manipulating Poincare maps directly. This attribute makes them well matched for studying accelerators whose physics is most naturally modelled in terms of maps, an observation that has been championed most vigorously by Forest. In the following sections the author sketchs a little background, explains some of the physics underlying these techniques, and discusses the best computing strategy for implementing them in conjunction with modeling accelerators.

10622 (FNAL-TM–1916) **Coupling in the Tevatron.** Gelfand, N.M. Fermi National Accelerator Lab., Batavia, IL (United States). Dec 1994. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE95005129. Source: OSTI; INIS; NTIS; GPO Dep.

The performance of the Fermilab Tevatron Collider at the commencement of run Ib was far below expectations. After a frustrating period of several months, a low-β quad downstream of the interaction point at B0 was found to be rolled. This rolled quadrupole coupled the horizontal and vertical motion of the Tevatron beams. It also made matching the beam from the Main Ring to the Tevatron impossible, resulting in emittance blow up on injection. The net result of the roll was a significant reduction in the Tevatron luminosity. When the roll in the quadrupole was corrected the performance of the Tevatron improved dramatically. This note will discuss the experimental data indicating the presence of coupling and subsequent calculations which show how coupling an affect the luminosity. It is not intended to exhaust a discussion of

coupling, which hopefully will be understood well enough to be discussed in a subsequent note.

10623 (FNAL-TM–1920) **132 ns Bunch Spacing in the Tevatron Proton-Antiproton Collider.** Holmes, S.D.; Holt, J.; Johnstone, J.A.; Marriner, J.; Martens, M.; McGinnis, D. Fermi National Accelerator Lab., Batavia, IL (United States). Dec 1994. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE95005750. Source: OSTI; NTIS; INIS; GPO Dep.

Following completion of the Fermilab Main Injector it is expected that the Tevatron proton-antiproton collider will be operating at a luminosity in excess of 5×10^{31} cm^{-2} with 36 proton and antiproton bunches spaced at 396 nsec. At this luminosity, each of the experimental detectors will see approximately 1.3 interactions per crossing. Potential improvements to the collider low beta and rf systems could push the luminosity beyond 10×10^{31} $cm^{-2}sec^{-1}$, resulting in more than three interactions per crossing if the bunch separation is left unchanged. This paper discusses issues related to moving to ≈100 bunch operation, with bunch spacings of 132 nsec, in the Tevatron. Specific scenarios and associated hardware requirements are described.

10624 (GSI–94-88(prepr.)) **Space charge dominated beam transport.** Hofmann, I. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Dec 1994. 18p. Order Number DE95755771. Source: OSTI; NTIS (US Sales Only); INIS.

We consider beam transport systems where space charge forces are comparable in strength with the external focusing force. Space charge then plays an important role for beam transmission and emittance growth. We use the envelope model for matching and the generalized field energy equations to study emittance growth. Analytic results are compared with numerical simulation. (orig.)

10625 (JINR–4-61-93, pp. 6-12) **Using of internal targets in the Nuclotron.** Artemov, A.S. Joint Inst. for Nuclear Research, Dubna (Russian Federation); Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1993. In *JINR rapid communications. Collection.* 75p. Order Number DE95616411. Source: OSTI; NTIS (US Sales Only); INIS.

7 refs.

The potentialities of investigation of nucleus-nucleus collisions on internal beams of the Nuclotron (a specialized superconducting strong-focusing accelerator of nuclei at the Laboratory of High Energies, JINR) are discussed. Emphasis is made on the importance of the change of the beam parameters as a result of ion-internal target interaction. Analytical expressions for the evolution of beam parameters are obtained. The target station which was used in the first experiment at the Nuclotron is described. The time change of the ion flux interacting with an internal target which was controlled by means of target radiation agrees with theoretical estimations. 7 refs.

10626 (SLAC-PUB–95-6720) **Nonlinear beam dynamics experimental program at SPEAR.** Tran, P. (Univ. of California, Los Angeles, CA (United States)); Pellegrini, C.; Cornacchia, M.; Lee, M.; Corbett, W. Stanford Linear Accelerator Center, Menlo Park, CA (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9409258–5: Workshop on nonlinear dynamics in particle accelerators: theory and experiments, Arcidosso (Italy), 4-9 Sep 1994). Order Number DE95007823. Source: OSTI; NTIS; INIS; GPO Dep.

Since nonlinear effects can impose strict performance limitations on modern colliders and storage rings, future performance improvements depend on further understanding of nonlinear beam dynamics. Experimental studies of nonlinear beam motion in three-dimensional space have begun in SPEAR using turn-by-turn transverse and longitudinal phase-space monitors. This paper presents preliminary results from an on-going experiment in SPEAR.

10627 (SLAC-PUB–95-6763) **Beam-beam interaction working group summary.** Siemann, R.H. Stanford Linear Accelerator Center, Menlo Park, CA (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9409258–4: Workshop on nonlinear dynamics in particle accelerators: theory and experiments, Arcidosso (Italy), 4-9 Sep 1994). Order Number DE95007824. Source: OSTI; NTIS; INIS; GPO Dep.

The limit in hadron colliders is understood phenomenologically. The beam-beam interaction produces nonlinear resonances and makes the transverse tunes amplitude dependent. Tune spreads result from the latter, and as long as these tune spreads do not overlap low order resonances, the lifetime and performance is acceptable. Experience is that tenth and sometimes twelfth order resonances must be avoided, and the hadron collider limit corresponds roughly to the space available between resonances of that and lower order when operating near the coupling resonance. The beam-beam interaction in e^+e^- colliders is not understood well. This affects the performance of existing colliders and could lead to surprises in new ones. For example. a substantial amount of operator tuning is usually required to reach the performance limit given above, and this tuning has to be repeated after each major shutdown. The usual interpretation is that colliding beam performance is sensitive to small lattice errors, and these are being reduced during tuning. It is natural to ask what these errors are, how can a lattice be characterized to minimize tuning time, and what aspects of a lattice should receive particular attention when a new collider is being designed. The answers to this type of question are not known, and developing ideas for calculations, simulations and experiments that could illuminate the details of the beam-beam interaction was the primary working group activity.

10628 (SSCL–680) **Beam instability studies for the SSC.** Chou, W. Superconducting Super Collider Lab., Dallas, TX (United States). Sep 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95008024. Source: OSTI; NTIS; INIS; GPO Dep.

Beam instability studies of the Superconducting Super Collider (SSC) during the period 1989–1993 are briefly reviewed in this paper. Various topics are covered: single bunch and multi-bunch, single beam and beam-beam, parasitic heating and active feedback, etc. Although the SSC will not be built, many of the results obtained from these studies remain as useful references to the accelerator community.

10629 (BNL–60349) **Induced axial oscillations in superconducting dipole windings.** Sampson, W.B.; Ghosh, A.K. Brookhaven National Lab., Upton, NY (United States). [1994]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-941013–23: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95005690. Source: OSTI; INIS; NTIS; GPO Dep.

When superconducting accelerator magnets wound from multistranded conductor are energized a periodic variation appears in the magnetic field along the axis. This oscillation is present in al components of the field and has a period that is equal to the transposition pitch of the superconducting cable. Such axial variations have been observed even in windings which are not carrying any transport current. A magnetic field was applied to a portion of a dipole winding using a second magnet. Axial oscillations were induced along the total length of the windings including the portion not in the applied field. The amplitude of these oscillations varied with the amount of inert winding inside the energizing magnet and with t;he angle of the applied field. These field variations could be completely applied field. These field variations could be completely eliminated in the external portion of the coil by heating a small section of the winding above the transition temperature.

10630 (BNL–60350) **Manufacture and testing of the superconducting wire and cable for the RHIC dipoles and quadrupoles.** Greene, A.F. (Brookhaven National Lab., Upton, NY (United States)); Garber, M.G.; Ghosh, A.K.; McChesney, D.;

Morgillo, A.; Shah, R.; DelRe, S.; Epstein, G.; Hong, S.; Lichtenwalner, J.; O'Larey, P.; Smathers, D.; Boivin, M.; Meserve, R. Brookhaven National Lab., Upton, NY (United States). [1994]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-941013–30: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95006000. Source: OSTI; NTIS; INIS; GPO Dep.

Production of superconducting wire and cable for RHIC dipoles and quadrupoles is now complete. This report presents final statistics generated during the manufacture and testing of this cable.

10631 (BNL–60352) **Field quality improvements in superconducting magnets for RHIC.** Gupta, R.; Jain, A.; Kahn, S.; Morgan, G.; Thompson, P.; Wanderer, P.; Willen, E. Brookhaven National Lab., Upton, NY (United States). [1994]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-940618–117: 4. European particle accelerator conference, London (United Kingdom), 27 Jun - 1 jul 1994). Order Number DE95006096. Source: OSTI; NTIS; INIS; GPO Dep.

A number of techniques have been developed-and tested to improve the field quality in the superconducting dipole and quadrupole magnets to be used in the Relativistic Heavy Ion Collider (RHIC). These include adjustment in the coil midplane gap to compensate for the allowed and non-allowed harmonics, inclusion of holes and cutouts in the iron yoke to reduce the so harmonics, and magnetic tuning shims to correct for the residual errors. We compare the measurements with the calculations to test the validity of these concepts.

10632 (BNL–61409) **Magnetic field measurements of the harmonic generation FEL superconducting undulator at BNL-NSLS.** Solomon, L. (Brookhaven National Lab., Upton, NY (United States)); Graves, W.S.; Lehrman, I. Brookhaven National Lab., Upton, NY (United States). [1994]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9408146–16: 16. international free electron laser conference, Stanford, CA (United States), 21-26 Aug 1994). Order Number DE95007680. Source: OSTI; NTIS; INIS; GPO Dep.

A three stage superconducting undulator (modulator, dispersive section, and radiator) is under construction at Brookhaven National Laboratory. Sections of the radiator, consisting of 25cm long steel yokes, each with 18mm period, 0.54 Tesla field, and 8.6mm gap are under test. The magnetic measurements and operational characteristics of the magnet are discussed. Measurement results and analysis are presented, with emphasis on the integrated field quality. The magnet winding and the effects of the various trims are discussed.

10633 (BNL–61410) **Optical design and performance of the inelastic scattering beamline at the National Synchrotron Light Source.** Kao, C.C. (Brookhaven National Lab., Upton, NY (United States)); Siddons, D.P.; Oversluizen, T.; Hastings, J.B.; Hamalainen, K.; Krisch, M. Brookhaven National Lab., Upton, NY (United States). [1994]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-940714–50: International meeting on synchrotron radiation instrumentation, Stony Brook, NY (United States), 18-22 Jul 1994). Order Number DE95007679. Source: OSTI; NTIS; INIS; GPO Dep.

Phase I of the X21 beamline at the National Synchrotron Light Source was commissioned during 1993. The research program at the X21 beamline is focused on the study of electronic excitations in condensed matter with total energy resolution of 0.1 eV to 1.0 eV. The source is a 27 pole hybrid wiggler. A water-cooled horizontal focusing Si(220) monochromator and a spherically bent Si(444) analyzer were installed and commissioned. At 8 keV the energy resolution of the monochromator is about 0.7 eV, and the energy resolution of the analyzer is about 0.1 eV. Results from several selected experiments are also discussed.

10634 (CONF-9410294–1) **Investigation of a new type charging belt.** Jones, N.L. (Oak Ridge National Lab., TN (United States). Accelerator Based Atomic Physics). Oak Ridge National Lab., TN (United States). [1994]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1994 symposium of the North Eastern Accelerator personnel (SNEAP-94); Kalamazoo, MI (United States); 12-15 Oct 1994. Order Number DE95006390. Source: OSTI; NTIS; INIS; GPO Dep.

There are many desirable characteristics for an electrostatic accelerator charging belt. An attempt has been made to find a belt that improves on these properties over the stock belt. Results of the search, procurement, and 1,500 hours of operational experience with a substantially different belt are reported.

10635 (CONF-9410294–2) **A video strip chart program.** Jones, N.L. (Oak Ridge National Lab., TN (United States). Accelerator-Based Atomic Physics). Oak Ridge National Lab., TN (United States). [1994]. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1994 symposium of the North Eastern Accelerator personnel (SNEAP-94); Kalamazoo, MI (United States); 12-15 Oct 1994. Order Number DE95006389. Source: OSTI; NTIS; INIS; GPO Dep.

A strip chart recorder has been utilized for trend analysis of the Oak Ridge National Laboratory EN tandem since 1987. At the EN, the author could not afford the nice eight channel thermal pen recorder that was used at the 25 URC. He had to suffice with two channel fiber tip or capillary pen type recorders retrieved from salvage and maintained with parts from other salvaged recorders. After cycling through several machines that eventually became completely unserviceable, a search for a new thermal recorder was begun. As much as he hates to write computer code, he decided to try his hand at getting an old data acquisition unit, that had been retrieved several years ago from salvage, to meet his needs. A BASIC language compiler was used because time was not available to learn a more advanced language. While attempting to increase acquisition and scroll speed on the 6 MHz 80286 that the code was first developed on, it became apparent that scrolling only the first small portion of the screen at high speed and then averaging that region and histogramming the average provided both the speed necessary for capturing fairly short duration events, and a trend record without use of back scrolling and disk storage routines. This turned out to be quite sufficient.

10636 (ENEA-RT-ERG-FUS–93-17, pp. 29-40) **14 MeV Frascati Neutron Generator.** Martone, M. (Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy)); Angelone, M.; Pillon, M. ENEA, Frascati (Italy). Dipt. Fusione. Nov 1993. (CONF-930928–Vol.1: 6. international conference on fusion reactor materials, Stresa (Italy), 27 Sep - 1 oct 1993; RT/ERG-FUS–92-17). In *Contributions to the 6. international conference on fusion reactor materials.* 68p. Order Number DE95749679. Source: OSTI; NTIS (US Sales Only).

The 14 MeV Frascati Neutron Generator (FNG) uses the T(d,n)alfa fusion reaction to produce 5.0 1011 n/s. In F.N.G. a beam of deuterons is accelerated up to 300 KeV by means of a linear electrostatic tube and directed onto a titanium tritiated target containing 3.7 1011 Bq of tritium. This paper describes the F.N.G. facility and its auxiliary apparatus as well as the neutron source calibration performed using the associated alfa-particle method.

10637 (FNAL/C–94/353-E) **Test beam results of a low-pressure micro-strip gas chamber with a secondary-electron emitter.** Kwan, S. (Fermi National Accelerator Lab., Batavia, IL (United States)); Anderson, D.F.; Zimmerman, J.; Sbarra, C.; Salomon, M. Fermi National Accelerator Lab., Batavia, IL (United States). Oct 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-941061–17: Nuclear science symposium: medical imaging conference, Norfolk, VA (United States), 30 Oct - 5 nov 1994). Order Number DE95005107. Source: OSTI; NTIS; INIS; GPO Dep.

We present recent results, from a beam test, on the angular dependence of the efficiency and the distribution of the signals on the anode strips of a low-pressure microstrip gas chamber with a thick CsI layer as a secondary-electron emitter. New results of CVD diamond films as secondary-electron emitters are discussed.

10638 (FNAL/C–94/358) **Statistical data analysis.** Hahn, A.A. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1994. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9410219–24: Beam instrumentation workshop, Vancouver (Canada), 2-6 Oct 1994). Order Number DE95007214. Source: OSTI; NTIS; INIS; GPO Dep.

The complexity of instrumentation sometimes requires data analysis to be done before the result is presented to the control room. This tutorial reviews some of the theoretical assumptions underlying the more popular forms of data analysis and presents simple examples to illuminate the advantages and hazards of different techniques.

10639 (FNAL-TM–1904) **Report III on Switchyard beam position monitor.** Ma, Hengjie. Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE95005131. Source: OSTI; INIS; NTIS; GPO Dep.

In this report, we will first discuss some basic beam position measurement schemes. Then, we will analyze the characteristics of several possible bpm designs to find out the optimum scheme for the switchyard application. Finally, the design of the second SY BPM prototype generated from our research will be introduced. As a by-product of developing the second prototype, a possible design of the bpm for handling fast spill with very short duty-cycle has also been found.

10640 (FNAL-TM–1905) **The effect of beam intensity on the estimation bias of beam position.** Ma, H. Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE95005130. Source: OSTI; INIS; NTIS; GPO Dep.

For the signals of the beam position monitor (BPM), the signal-to-noise ratio (SNR) is directly related to the beam intensity. Low beam intensity results in poor SNR. The random noise has a modulation effect on both the amplitude and phase of the BPM signals. Therefore, the beam position measurement has a certain random error. In the currently used BPM, time-averaging and waveform clipping are used to improve the measurement. The nonlinear signal processing results in a biased estimate of beam position. A statistical analysis was made to examine the effect of the SNR, which is determined by the beam intensity, on the estimation bias. The results of the analysis suggest that the estimation bias has a dependence not only on the beam position but also on beam intensity. Specifically, the dependence gets strong as the beam intensity decreases. This property has set a lower limit of the beam intensity range which the BPM's can handle. When the beam intensity is below that limit the estimation bias starts to vary dramatically, resulting in the BPMs failure. According to the analysis, the lowest beam intensity is that at which the SNR of the generated BPM signal is about 15 dB. The limit for NSEP BPM, for instance, is about 6EII. The analysis may provide the BPM designers with some idea about the potential of the current BPM'S.

10641 (FNAL-TM–1917) **Measurement of the D0 WAMUS magnet inductance.** Kristalinski, A.; Hance, R.; Jaskierny, W. Fermi National Accelerator Lab., Batavia, IL (United States). Dec 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE95005128. Source: OSTI; NTIS; INIS; GPO Dep.

Historically, the term inductance, as it relates to magnets, has been relatively obscure at Fermilab. Confusion resulted from the typical engineering approach to the matter, whereby distinction may not have been made between analytical and beam line magnets; and distribution transformers. The latter always have a laminated core to reduce eddy currents which makes their inductance in a transitional state very close to that in a steady state. This is true only if the core material is not in saturation, which is once again the case for transformers; but not for magnets, especially the analytical ones. Based on the traditional "transformer" thinking, an incorrect method to measure magnet inductance was initially employed. The characteristics of a tank circuit including the magnet under test were observed. Then based on the resonant frequency and quality factor, the inductance was calculated. This method represents a very valuable tool for magnet testing where you can compare newly built magnets to a reference magnet and see if there is any difference. Although electrically correct, this method unfortunately does not reveal any valuable information which could be used to anticipate the magnet behavior under the normal working conditions. Another method of measuring inductance, based on a freewheeling discharge of the magnet, is also widely used in the Lab. To measure the inductance, a magnet is powered from a small power supply for up to 100 A to 200 A, then the power is turned off and the current decay in the magnet is recorded. Based on the dc resistance measurements and the magnet current decay data, one can determine the magnet inductance. In order to do so, the inductance is assumed to be constant and current decay is assumed to be exponential. To find out how well the effective inductance represents the real process taking place in the magnet was one of the purposes of the experiment.

10642 (JINR–6-63-93, pp. 13-23) **Design concept and computer simulation of nuclotron beam extraction system with a bent crystal.** Kovalenko, A.D.; Mikhajlov, V.A.; Taratin, A.M.; Tsyganov, Eh.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation); Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1993. In *JINR rapid communications. Collection 6.* 62p. Order Number DE95616386. Source: OSTI; NTIS (US Sales Only); INIS.

The scheme of nuclei beam extraction from Nuclotron by means of a bent crystal has been considered. Different methods for the beam guidance onto the crystal were discussed. It is more reasonable to simultaneously use an orbit bump and a transverse diffusion of the beam particles. Deflection efficiency of the nuclei beam with energy of 6 GeV/u by a bent silicon crystal and their multiturn extraction from Nuclotron has been studied by computer simulation. It was shown that with an optimal crystal length the extraction efficiency may be increased considerably due to multiple passages of particles through the crystal deflector. (author). 14 refs., 7 figs.

10643 (JINR-R–9-94-329) **Analysis of the Nuclotron Dipoles and Quadrupoles Magnetic Measurements.** Donyagin, A.M.; Kovalenko, A.D.; Kozlov, O.S.; Mikhajlov, V.A.; Smirnov, A.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1994. 22p. (In Russian). Order Number DE95621573. Source: OSTI; NTIS (US Sales Only); INIS.

The statistical processing of the Nuclotron dipoles and quadrupoles magnetic data has been made. The calculated nonlinearities are discussed from the viewpoint of betatron motion stability. The algorithm of the dipole ordering aimed to minimize the closed orbit distortion is considered. (author). 4 refs., 9 figs., 6 tabs.

10644 (KEK-PROC–93-10, pp. 367-370) **Development of a positron source for the ATF (Accelerator Test Facility).** Ida, H. (NKK Corp., Kawasaki, Kanagawa (Japan). Engineering Research Center); Yamada, K.; Aoki, A. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

The Japan Linear Collider (JLC) requires a positron source which produces $8x10^{11}$ particles per RF-pulse. A computer simulation shows the possibility of such an intense positron source using conservative technology. In order to verify the performance of the positron source experimentally, a prototype positron source has been designed and is now being manufactured. The prototype positron source consists of stationary target unit, DC solenoid magnets, pulsed flux concentrator, and an accelerating structure. It will be installed downstream of 1.54 GeV S-band linac of the Accelerator Test Facility (ATF). (author).

10645 (KEK-PROC–93-10, pp. 371-374) **Investigation on the positron factory project at JAERI. 6. A pilot study of the self-driven rotary converter for high-power beams.** Okada, Sohei (Japan Atomic Energy Research Inst., Takasaki, Gunma (Japan). Takasaki Radiation Chemistry Research Establishment); Sunaga, Hiromi; Kaneko, Hirohisa; Takizawa, Haruki; Yotsumoto, Keiichi. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

We performed computer simulations on the target system (converter and moderator) to produce intense slow positron beams ($>10^{10}$/sec) by an electron bombardment of 100 to 150 MeV, 100

kW. We concluded from the result that the usual converter would melt down. To avoid this, it is essential to adopt techniques to divide and rotate the converter. Under the strong radiation field, however, there will be limitations to the utilization of a motor and a rotating penetration, due to their degradation. We devised the self-driven rotary converter which rotates by the kinetic energy of the coolant without any penetrations. The feasibility study using a pilot device is demonstrated in this paper. (author).

10646 (KEK-PROC–93-10, pp. 375-379) **PF slow positron source.** Shirakawa, A. (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Enomoto, A.; Kurihara, T. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

A new slow-positron source is under construction at the Photon Factory. Positrons are produced by bombarding a tantalum rod with high-energy electrons; they are moderated in multiple tungsten vanes. We report here the present status of this project. (author).

10647 (KEK-PROC–93-10, pp. 380-382) **Beam transport of PF (Positron Factory) 2.5-GeV linac.** Shiraga, Takahiro (Naruto Univ. of Education, Tokushima (Japan)); Asami, Akira; Suwada, Tsuyoshi; Kobayashi, Hitoshi. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

The beam transport is one of the most important problems in the linac to be used as the injector for the B-FACTORY accelerators. A basic problem of the beam transport is how to correct transport parameters immediately when a klystron becomes off. This is studied with the PF (Positron Factory) 2.5-GeV linac. (author).

10648 (KEK-PROC–93-10, pp. 383-385) **Parasitic experiment using electron beam.** Ito, Sachiko (Tohoku Univ., Sendai (Japan). Lab. of Nuclear Science); Ito, Hideaki; Konno, Osamu. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

A test of the new beam line for parasitic photo-nuclear experiments was performed using a continuous electron beam from the pulsed beam stretcher. A good beam quality for such kinds of experiments has been obtained. (author).

10649 (KEK-PROC–93-10, pp. 386-389) **Degassing properties in accelerator materials by bombardment method.** Watanabe, Hajime (Furukawa Electric Co. Ltd., Tokyo (Japan)); Kakihara, Kazuhisa; Oogoe, Takao; Enomoto, Atsushi; Sato, Isamu. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

Two kinds of samples of oxygen free copper(OFC) containing different densities of gas were stimulated in two ways: (a) in electron bombardment and (b) thermally. The sample temperature increased in the first case to about 120degC and in the second up to 550degC. The experiment shows that for electron bombardment, the outgassing rate during the second method includes H_2, H_2O, CO and CO_2. Also in this case the sample with higher gas density was having a higher outgassing rate. (author).

10650 (KEK-PROC–93-10, pp. 390-394) **Initial pumping characteristics of oxygen free copper duct.** Nagai, Yasuchika (Hitachi Cable, Ltd., Tokyo (Japan)); Yamamoto, Yoshiki; Saito, Yoshio; Matuda, Namio. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

After repetitive exposures to air and nitrogen by turns, the initial pumping characteristics of vacuum degassed oxygen free copper (OFC) duct and stainless steel duct are compared. Even without baking, OFC duct requires just the same evacuation time to reach a desired pressure as the prebaked stainless steel duct. Furthermore, the baking effectively shortens the evacuation time of OFC duct. (author).

10651 (KEK-PROC–93-10, pp. 395-398) **Pressure distribution analysis of the KEK 2.5-GeV linac.** Kakihara, Kazuhisa (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Saito, Yoshio. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

Since the vacuum system of a linac comprises many conduit pipes (such as accelerator columns, waveguides and pump ducts) it is a multiply connected network. In such a network having n nodes, by introducing an nxn Green-function matrix determined by the network geometry, the pressure (p_i) at the i th node can be expressed as $(p_i)=[G_{ij}](Q_j)$, where (Q_j) is the gas load. This type of analysis was applied to a KEK 2.5-GeV linac with 14 nodes, 19 branchs and 2 pumps within the unit. The results show that the outgassing rate of the accelerator columns made of oxygen-free copper decreases from $\approx 10^{-10}$ to $\approx 10^{-11}$ Torr 1 $cm^{-2}s^{-1}$ after high-power conditioning. (author).

10652 (KEK-PROC–93-10, pp. 399-401) **Development of vacuum system for ATF(Accelerator Test Facility) damping ring.** Terunuma, Nobuhiro (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Kanazawa, Ken-ichi; Hori, Youichiro; Urakawa, Junji. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

Design study on the vacuum system for the damping ring of the Accelerator Test Facility (ATF) is in progress. Details of them and results of the vacuum test for some chambers are described. (author).

10653 (KEK-PROC–93-10, pp. 402-404) **Development of active girder for ATF damping ring.** Funahashi, Yoshisato (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Takeuchi, Yasunori; Taino, Mitsuhiko; Urakawa, Junji; Yoshioka, Masakazu; Ishihara, Nobuhiro; Takeda, Shigeru. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

An active supporting table was designed and made to control the position of magnets for the ATF damping ring. The performance of the active girder has been investigated. The outline of the active girder and the results of the performance test are presented. The results of positioning and vibration test show that this active girder has enough performance to control the position of magnets for the ATF damping ring. In future, this active girder will be modified to more simple one with the positioning resolution of 1 μm for the precise vertical active alignment. (author).

10654 (KEK-PROC–93-10, pp. 405-407) **R and D status of the magnet system for ATF damping ring.** Egawa, Kazumi (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Urakawa, Junji; Nakayama, Hisayoshi. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

The ATF damping ring (DR) requires very strict conditions for the magnets system to realize a very low vertical normalized emittance less than $3x10^{-8}$ rm and a fast damping time. To obtain such a

low emittance, the ATF-DR adopted a combined FOBO lattice and damping wigglers. Specifications of the magnet system have been almost fixed and some R and D magnets, which are a damping wiggler, a combined bending, quadrupoles and a sextupole magnet, have been manufactured and are waiting for precise field measurements. R and D status of these magnets are described. (author).

10655 (KEK-PROC–93-10, pp. 411-413) **Suppression of coherent synchrotron radiation in metallic shields. 2.** Kato, Ryukou (Tohoku Univ., Sendai (Japan). Lab. of Nuclear Science); Nakazato, Toshiharu; Oyamada, Masayuki. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

A suppression effect of coherent synchrotron radiation due to conducting boundaries was observed by using the Tohoku 300 MeV Linac. Electron bunches, whose energy was 50 MeV and longitudinal length was 1.65 mm, were bent by the magnetic field of 68.6 mT between a pair of finite parallel aluminum plates with a variable gap in a vacuum chamber. As the shielding gap became narrow, the intensity of coherent synchrotron radiation was enhanced at first and then drastically suppressed. The results can be qualitatively explained by the theory of suppression effect obtained by Nodvick and Saxon and applicable to the intense and short-bunched accelerators. (author).

10656 (KEK-PROC–93-10, pp. 414-416) **Present status of the TOHOKU 300 MeV linac.** Takahashi, Shigenobu (Tohoku Univ., Sendai (Japan). Lab. of Nuclear Science); Oyamada, Masayuki; Urasawa, Shigekazu; Nakazato, Toshiharu; Kurihara, Akira; Mutoh, Masakatu; Shibasaki, Yoshinobu; Oonuma, Tadahiro. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

The TOHOKU linac that was constructed about a quarter century before has been operated without serious trouble recently. This report describes as follows: main trouble, maintenance, present performance of the machine and status of operation. (author).

10657 (KEK-PROC–93-10, pp. 417-420) **Status of twin linac at NERL of University of Tokyo.** Ueda, Toru (Tokyo Univ., Tokai, Ibaraki (Japan). Nuclear Engineering Research Lab.); Kobayashi, Toshiaki; Kozawa, Takahiro; Yoshida, Yoichi; Uesaka, Mitsuru; Miya, Kenzo. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

The energy fluctuation of the 28 MeV linac has been improved by using the frequency feedback which is adjusted with the manual control to keep the resonant frequency of the accelerator tubes. The fluctuation of the average beam current which passed through the energy analyzing magnet (0.2%ΔE/E) was obtained less than 3 % during an hour. (author).

10658 (KEK-PROC–93-10, pp. 421-425) **Progress on the LINAC in Osaka University.** Yamamoto, Tamotsu (Osaka Univ., Ibaraki (Japan). Inst. of Scientific and Industrial Research); Ohkuma, Juzo; Kimura, Norio; Okuda, Shuichi; Honda, Yoshihide; Takamuku, Setsuo; Okada, Toichi; Suemine, Shouji; Takeda, Seishi. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

Two LINACs are operated in Osaka University. One of these, L-band LINAC, has been used for various kinds of research works. Recently, great attention is paid to the advanced beam technology, such as FEL (Free Electron Lasers) and slow positron beam. Concerning FEL, many efforts have been made to understand physical property of interactions between high energy electrons and electromagnetic field. In order to establish FEL facility, the improvement of beam quality is inevitable. In this paper, one attempt for making beam quality better is presented. Another LINAC, S-band LINAC, is mainly used for the production of positrons. The progress on the development of slow positron source is also shown. (author).

10659 (KEK-PROC–93-10, pp. 426-428) **Present status of the ETL LINAC facility.** Suzuki, Ryoichi (Electrotechnical Lab., Tsukuba, Ibaraki (Japan)); Mikado, Tomohisa; Ohgaki, Hideaki. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

The ETL LINAC has been operated for the beam injection to the storage rings NIJI-II, III, IV, and TERAS, and for the generation of an intense slow positron beam. The status of the ETL LINAC on the operations, the maintenances, and the improvements is described. (author).

10660 (KEK-PROC–93-10, pp. 429-433) **Present status of the KEK 40MeV Proton Linac.** Igarashi, Zenei (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Kawamura, Masato; Kubota, Chikashi; Nanmo, Kesao; Takasaki, Eiichi; Takenaka, Tateru. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

The 40MeV Proton Linac has supplied the H-beam of about 5mA with the beam pulse width of about 80μs to the Booster Synchrotron for the BSF. In April, 1992 and 1993, the deuteron beam of about 2.5mA was accelerated with the 4π-mode. In FY 1993, the α-particles will be accelerated. In FY 1992, we had many electric and mechanical troubles with the RF-sources, the cooling system of the drift-tubes and the RF-exciting of the 20MeV tank and so on. In this report, details of troubles experienced in FY 1992 and some improvements of monitor system are described. (author).

10661 (KEK-PROC–93-10, pp. 434-438) **Present status of the PF injector.** Ohsawa, Satoshi (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

After construction of the PF 2.5-GeV linac and the Positron Generator Linac, continuous efforts have been made to improve performance of both linacs. The KEK B-Factory is presently under consideration as the TRISTAN phase-II future project. It requires 8-GeV electrons and 3.5-GeV positrons. The pre-injector has been upgraded in order to investigate instabilities induced by high intense electron beams in the main linac. Several developments, investigations and considerations are underway for the project. The present status of the PF injector linacs is described. (author).

10662 (KEK-PROC–93-10, pp. 439-442) **Bunch length measurement using coherent radiation.** Nakazato, Toshiharu (Tohoku Univ., Sendai (Japan). Lab. of Nuclear Science); Urasawa, Shigekazu; Oyamada, Masayuki; Yamakawa, Tatsuya; Kondo, Yasuhiro; Suzuki, Yoshiro; Shimoyama, Katsuhiko; Shibata, Yukio. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

A bunch length measuring method using coherent synchrotron radiation, coherent transition radiation and coherent Cerenkov radiation is presented. The spectrum of these coherent radiations is the bunch form factor, the Fourier transformation of the longitudinal distribution of electrons in a bunch. Therefore the bunch length is obtained by inverse-Fourier-transforming the measured spectrum. It is the most important feature of this method that the shorter bunch length is easier to measure than the longer one. The bunch length of several tens micrometer will be able to be measured by this method. (author).

10663 (LA-SUB–94-169) **Radial electron-beam-breakup transit-time oscillator.** Mostrom, M.A. (Mission Research Corp., Albuquerque, NM (United States)); Kwan, T.J.T. Los Alamos National Lab., NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95005731. Source: OSTI; NTIS; GPO Dep.

A new radially-driven electron-beam-breakup transit-time oscillator has been investigated analytically and through computer simulation as a compact low-impedance high-power microwave generator. In a 1MV, 50kA device 35cm in radius and 15cm long, with no external magnetic field, 5GW of extracted power and a growth rate of 0.26/ns have been observed. Theoretical maximum efficiencies are several times higher.

10664 (LA-UR–94-4118-Rev.) **Optical and x-ray imaging of electron beams using synchrotron emission.** Wilke, M. Los Alamos National Lab., NM (United States). [1995]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9410219–20-Rev.: Beam instrumentation workshop, Vancouver (Canada), 2-6 Oct 1994). Order Number DE95005262. Source: OSTI; NTIS; INIS; GPO Dep.

In the case of very low emittance electron and positron storage ring beams, it is impossible to make intrusive measurements of beam properties without increasing the emittance and possibly disrupting the beam. In cases where electron or positron beams have high average power densities (such as free electron laser linacs), intrusive probes such as wires and optical transition radiation screens or Cherenkov emitting screens can be easily damaged or destroyed. The optical and x-ray emissions from the bends in the storage rings and often from linac bending magnets can be used to image the beam profile to obtain emittance information about the beam. The techniques, advantages and limitations of using both optical and x-ray synchrotron emission to measure beam properties are discussed and the possibility of single bunch imaging is considered. The properties of suitable imagers and converters such as phosphors are described. Examples of previous, existing and planned applications are given where available, including a pinhole imaging system currently being designed for the Advanced Photon Source at Argonne National Laboratory.

10665 (LBL–35574) **A beamline for macromolecular crystallography at the Advanced Light Source.** Padmore, H.A.; Earnest, T.; Kim, S.H.; Thompson, A.C.; Robinson, A.L. Lawrence Berkeley Lab., CA (United States). Aug 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-940714–51: International meeting on synchrotron radiation instrumentation, Stony Brook, NY (United States), 18-22 Jul 1994). Order Number DE95008496. Source: OSTI; NTIS; INIS; GPO Dep.

A beamline for macromolecular crystallography has been designed for the ALS. The source will be a 37-pole wiggler with a, 2-T on-axis peak field. The wiggler will illuminate three beamlines, each accepting 3 mrad of horizontal aperture. The central beamline will primarily be used for multiple-wavelength anomalous dispersion measurements in the wavelength range from 4 to 0.9 Å. The beamline optics will comprise a double-crystal monochromator with a collimating pre-mirror and a double-focusing mirror after the monochromator. The two side stations will be used for fixed-wavelength experiments within the wavelength range from 1.5 to 0.95 Å. The optics will consist of a conventional vertically focusing cylindrical mirror followed by an asymmetrically cut curved-crystal monochromator. This paper presents details of the optimization of the wiggler source for crystallography, gives a description of the beamline configuration, and discusses the reasons for the choices made.
